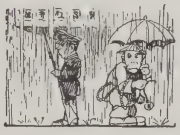
CHRONICLER OF THE NEGLECTED TRUTH

# BRIEFLY TOLD

It is reported that President Coolidge belongs to no secret order save the Phi Gamma Delta, a college fraternity.

Fireflies are greatly admired by the Japanese and firefly festivals are held on some of the rivers during midsummer, when thousands of the brilliant insects are released.



Haymaking by means of hot air under pressure now makes it possible to bale hay eight hours after raking.

Organized labor intends to enter the life insurance field. Representatives of more than forty national and international unions have taken steps to organize the Union Labor Life Association.

Chicago passed the 3,000,000 mark not long ago and now has only 25,000 fewer population than Paris, which ranks fourth in the world.

New Englanders eat pie for breakfast.

No traveler has ever crossed the great southern desert of Arabia.

Bandits cease their looting and the warriors their fighting when it rains in China, insuring peace to citizens.

A suit has been brought in Washington, D. C., to clear title to a strip of land one and one-half inches wide and one hundred and twenty feet long. It is a portion of the farm of Davy Burns. The White House stands on another section of the same farm.

The natives of Burma never leave their houses after dark because of a fear of "spirits."

Sir Robert Peel was the first man to organize a trained and uniformed police force in Britain, hence the name "peeler" and "bobby" which are applied to policemen.

Philadelphia is the birthplace of the "movies," for in 1870 at the academy of music there Henry Heyl threw on the screen a series of moving pictures of a waltzing couple.

In Norway and Denmark a small stick fastened to a string six inches or so in length is tied to packages to make them easier to carry.

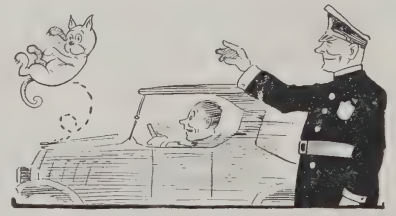
In olden times the king of Easter Island was chosen for his ability as a foot racer.

Kentucky has two women sheriffs who attained their offices through appointment following the deaths of their husbands, who were killed in line of duty.

It is said that the invention of the Marconi loud speaker will improve the quality of "orations," by making it possible for a man with a weak voice to be heard better.

A mountain lion saved the life of a Stony Sioux Indian near Banff, Alberta, recently when the Indian slipped over a precipice and landed on the lion which was feeding nearly 200 feet below.

George T. Moore, of St. Louis, says that the average city dweller would gain from 25 to 35 pounds a year if the body retained all the soot and dust breathed in.



Four hundred eighty new laws went into effect in California, July 24, 1925.

In some parts of Norway people look up the telephone number after taking down the receiver.

The Samoan race is the only race of Polynesians who are not dying out.

The idea of a chain of stores under one management was originated by George H. Hartford in 1859.

Masonic lodges in the United States number 16,330 and have a membership of 3 107,229.

The police chiefs of Rhode Island permit and insist that motorists must drive thirty-five miles an hour on the main highways or get off on the slower byways. Their experience shows that accidents are caused not by speed but by ineptitude or carelessness.

Paul Whiteman, the orchestra leader, was once a taxicab driver and still retains his public licenses.

Vineyards have been kept by the Mediterranean people since the time of Noah.

There are more houses in Belgium today than there were before the war.

The Emperor Vespasian, being sick with the disease whereof he died, when reproached by his physician for continuing to carry on matters of state, said: "An emperor should die standing."

Contrary to popular belief only .01 per cent of the inhabitants of Limehouse, London, engage exclusively in crime.

The cemetery which contains the burial plot of Nancy Hanks, mother of Abraham Lincoln, in Spencer County, Indiana, has been closed to motor vehicles.

It is said that the engraven bed of the Hudson is borne on the bottom of the sea for a long way out.

A university professor from Australia traveled 12,000 miles to attend the Empire Universities Congress at London only to find that he was a year ahead of time, the Congress not opening until the summer of 1926. A typist's error in the year of the Congress caused the misunderstanding.

Sweden has had no war since 1809.

Stationery office of the British Government corresponds to our Government Printing Office.

Java has doubled its population during the last forty years but has increased its production fivefold.

The American Beauty rose has been selected as the official flower of the District of Columbia.

The state of Washington has the only arc plant in America for fixing nitrogen.

The Bureau of Engraving and Printing turns out approximately 3,000,000 notes daily, amounting to at least $10,000,000.

Entered as Second-Class Matter at the Post Office at Dearborn, Mich., under the Act of March 3, 1879. Additional entry at Chicago, Ill.

# Presented in This Issue:

Mr. Ford's Page this week discusses war-starters and war-stoppers.

---

Is coal ceasing to be king? Is it passing out as fuel? Have the coal brokers killed their own game? It seems so. People are turning to other things. Monopoly and extortion always find their match. The rise of the oil burner is an amazing feature of our times. (p. 3)

---

Everybody in the Lake Region knows how low the water is this year. Some blame it on the Chicago drainage canal; others to general drouth. A map on p. 15 shows how all this may be remedied. The Great Lakes connected with the Arctic seas. Waters now emptying into Hudson Bay, pouring into Lake Superior. A Canadian engineer shows how. Worth reading for the broadening view it gives. (p. 15)

---

A good deal of water in this issue. From Lake Nipigon and others of the north, in article noted above, this week's literary current sweeps down to lovely Chesapeake Bay. From Havre de Grace to the sea, an historic body of water. (p. 31)

---

Still farther South the current sweeps, and ripples over Muscle Shoals. How that very important point first appeared on the map forms another of Professor Karpinski's series on the mapping of America. (p. 28)

---

Nor is that the full sweep of this issue. You may fly with the ducks to the wild rice fields of the north, where they pause on their journey south—a real story of the mallard, monarch of the marshes—a story of teal and coot, gray dawns and frosty grasses—by Donald Hough. (p. 12)

---

Or you may go to Alaska on the swift wings of the electric telegraph. Could you tell, were you asked, just how we communicate with Alaska—a sea and another country between? Neither could I, until I read this. (p. 6)

Sam Slick in Nova Scotia. These articles, we think, will help rescue a noted character in our literature. Sam is a source figure; Dickens copied him; he is the progenitor of our Uncle Sam. (p. 16)

---

There is, however, a deeper literary flavor in this issue. It is good to go back and refresh ourselves at the springs which made our fathers strong. Ralph Waldo Emerson was once the prophet of the new generation, and much of him is still contemporary. He has a place apart in American literature and thought. Dr. Atkins leads us into this serene presence, as one who has the right to enter and knows the secret of the seer. (p. 2)

---

Tom Masson seeks and finds a good story. (p. 5)

---

Walking canes have been found in tombs of ancient Egypt. The pilgrim staff has blossomed into kings' scepters, croziers of bishops, batons of field marshals. Some curiosities in walking sticks will be found in the story on p. 8.

---

Puzzles—cross-word and otherwise—and riddles, and all the rest of it, are as old as the walking sticks of Egypt. Cycles of interest are traceable. If you are on earth next time the cross-word puzzle or Chinese game is epidemic, you may pose as "discoverer" too. Nothing new under the sun. What is, has been. What was, will be again. Solomon said it. (p. 20)

---

Taxes—you may escape reading them, but not paying them. You pay all the taxes the government gets, and a lot it doesn't get. Therefore, it's your business. (p. 7)

---

Then there are the usual Editorials—some people disagree with them; many more agree. The former, however, get most benefit. Nothing like a difference of opinion to stimulate thought.

# Ralph Waldo Emerson —His Supreme Service

## "True Land-lord, Sea-lord and Air-lord"

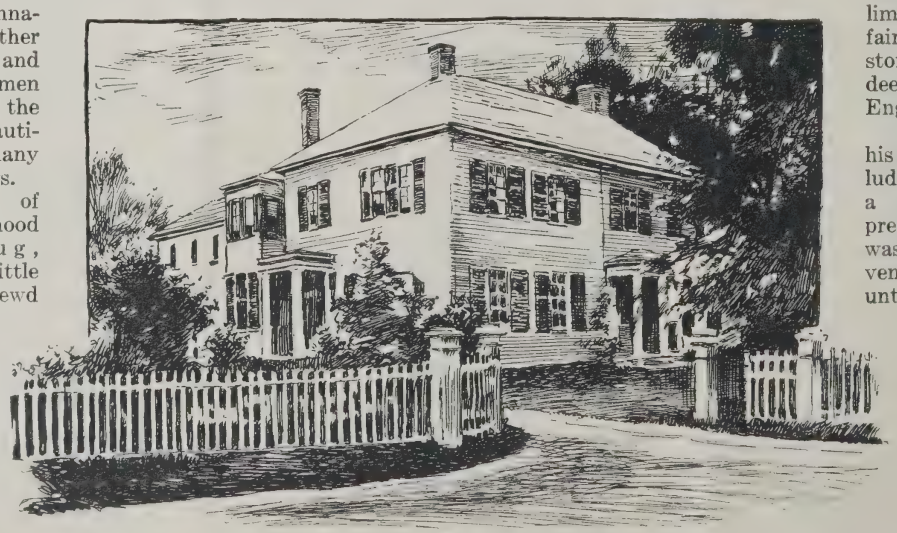
By GAIUS GLENN ATKINS

Ralph Waldo Emerson.

DR. C. W. ELIOT, who undertook some years ago to measure off ten—or six—feet of the world's best books, has lately measured off a space for the ten foremost educators of the last 2,000 years, and put Ralph Waldo Emerson among the ten—the only American—which is putting him, if one may use an entirely un-Emersonian phrase, in fast company.

If the interest of a man's life be measured by the circumstance and setting of it, Emerson's life was simple enough. Draw a circle twenty miles round Boston and you have him and his forbears inside that circle for a hundred years and needing only half of it at that. It should be not so much a circle as an eccentric ellipse with three centers: Boston, Harvard and Concord. Nor were the fortunes of the Emersons conspicuous for adventure. Massachusetts Bay had then, as earlier and later, merchants of force and imagination who claimed the seven seas in fee simple and built their India wharves for the storing of the goods of the gorgeous East; but the Emersons trafficked in another merchandise.

Emerson was descended from a line of seven ministerial generations, a crossing of Bulkleys and Waldos and Emersons and Moodys and Blisses. One of his ancestors, William Emerson, built the old manse from which Hawthorne gathered his mosses, saw the fight at Concord Bridge, rebuked his mother for drinking tea when that cheerful cup was under Colonial condemnation, and like other preachers, before and since, told fighting men how to fight. All the Emersons had beautiful voices and too many of them weak lungs.



The Boston of Emerson's boyhood was a smug, snug, red-brick little town, with a shrewd eye for trade, touching the country at Summer street and the Back Bay a marsh. Therein the Emersons lived simply, and Ralph, having a plain road before him marked by four signposts: Boston Latin School, Harvard College, The Divinity School, and a Unitarian pulpit, took it as a matter of course. At Harvard he was the president's freshman and had his lodging free of charge, with the duty of being the messenger of the gods and announcing faculty orders to the students. He was graduated with no distinction in scholarship and no great feeling of having profited from his academic course, after which he taught in his brother William the third's school for young ladies. Educating the young Boston female of the thirties was apparently profitable for he paid his debts and saved money, but he had no heart for it and presently went with his mother to Roxbury, where they lived on a farm in Featherbed Lane. His letters and journals reveal an original mind slowly finding itself and coming early to an unusual maturity of thought and expression.

He should naturally become a minister and returned to Cambridge where he took his divinity wholly half-heartedly. The family weakness threatened him and he went South, came back and took more divinity and began to preach. Meanwhile, in his thirty-first year, he became engaged to Miss Ellua Louise Tucker, "the fairest and best of her kind." She was 17 years old and very lovely in other than her lover's eyes, but apparently tubercular though no old-fashioned biographer will say so in so many words, rather "her pathetic charm due in part to the touch of a mortal malady."

He was called in his thirty-second year to the Second Church in Boston and forthwith married. He had for a little all that any man might ask—a wife who was a bright revelation, a good church, reasonable health and a fair future which he contemplated with apprehension, having that strange fear of happiness which lay deep in his religious inheritance from the Puritan seven times sublimited; for them a fair day was always a storm breeder, as indeed in Eastern New England it often is.

His preaching and his sermons were interludes in his career but a tradition of his preaching remains. It was simple, unconventional and more untheological than the preaching of his time which it easily may have been without at all approaching the unconventional and untheological of our own time. To the ortho-

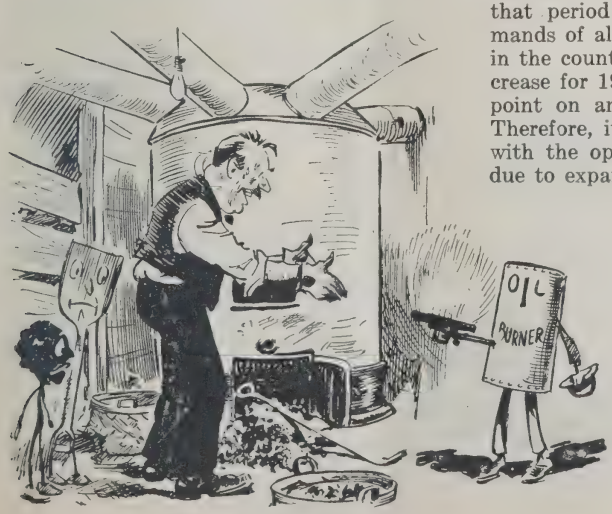
# Is Coal Passing Out As a Fuel?

By WILLIAM A. M'GARRY



A CONSUMERS' strike against coal is under way in the United States. It has been under way, to be accurate, ever since the uncertainty of supply became an annual or regular incident. During that period there were many signs of public discontent, but the operators got so much new business each year from expanding industry that the discontent went unheeded.

Now the inevitable has happened. The consumers' strike has caught up with the natural expansion of industry.

Proof of these statements is so voluminous that already it fills several volumes of government reports and special, secret surveys made by the mine operators. These surveys have been carried into every field of coal consumption. The most far-reaching and complex analyses have been made by the operators' experts in an effort to offset the decrease in demand. But the figures grow more ominous.

In 1924, with industry booming, railroads carrying more freight than ever before, and other big consumers running at new capacity levels, *less coal was called for in the United States than in 1923, 1920, 1918, 1917, or even 1916.* The total production was only slightly in excess of 1913. Compared to 1918, which is the year chosen by all the economists as the first "normal" twelvemonth after the war, the production in 1924 fell off more than one hundred million tons, although *the total energy demand of the country showed a tremendous increase.*

To put this in other terms, hard and soft coal represented 85 per cent of the total fuel energy of the United States in 1918, while in 1924 they represented only 72 per cent. During that period the total energy demands of all homes and industries in the country increased. The increase for 1924 over 1918 was one point on an index number scale. Therefore, it is obvious that even with the opening of new markets due to expansion of industry, coal did not succeed in holding its own.

The most remarkable feature of these figures is that they relate only to those forms of energy—heat, light, power—*produced by fuels.* They do not include the steadily increasing yields *obtained from hydro-electric plants.* Water power represents, according to government officials, only four to six per cent of the total energy output of the nation.

The real competitor of coal is oil, with natural gas a close second. And it is these fuels, together with the economies brought about in recent years, that have put the black diamond in the position of a declining industry just when all the experts had it figured out that the industry must continue to expand for many years to come.

At this writing, figures for 1925 are not sufficiently accurate to be worth quoting. But there is no longer any question that the trend away from coal is increasing in every field where coal is consumed. Even without the strike of hard-coal miners the operators knew that their markets would shrink during 1925 by five million tons or more. They have admitted a similar shrinkage attributable to domestic oil burners alone during 1924. The question now is how much this figure will be increased by the strike.

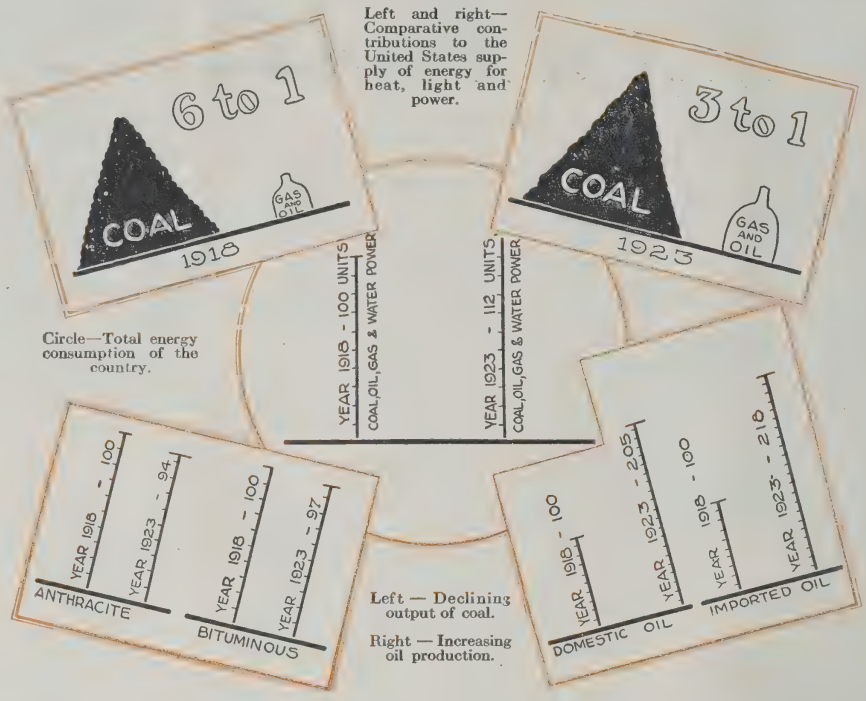
Nothing in the commercial history of the world supplies a more eloquent proof that shortsighted policy is self-destructive than what is happening now in coal. No other commodity save foodstuffs has been in such universal demand. Long ago it was recognized that fuel oil was the only substitute for coal which might get enough of the market to become a controlling factor. But oil was a relative infant.

Charts prepared by F. G. Tryon, W. F. McKenney and E. E. Finn, of the U. S. Geological Survey, show that fuel oil first became a factor in the energy demands of the country large enough to measure in 1869. From that year until 1913 the rate of increase in the use of oil and natural gas was large, regular and consistent. But the expansion of industry also went along

In 1910 the total coal production in the United States crossed the half-billion ton mark for the first time—the actual output being 501,596,378. The rise and fall of coal as the dominating factor in American industry since then is well illustrated by the following production record by years:

| Year | Tonnage | Year | Tonnage |
|---|---|---|---|
| 1911 | 496,371,126 | 1918 | 678,211,904 |
| 1912 | 534,466,580 | 1919 | 553,952,259 |
| 1913 | 569,960,219 | 1920 | 658,264,932 |
| 1914 | 513,525,477 | 1921 | 506,395,401 |
| 1915 | 531,619,487 | 1922 | 476,951,121 |
| 1916 | 590,098,175 | 1923 | 657,495,926 |
| 1917 | 651,402,374 | 1924 | 573,280,000 |

It will be noted that even with industry booming and the shortage caused by the strike of 1922, the 1923 output was below that of 1918.



so rapidly that the relative importance of oil and gas was inconsiderable until 1918. What happened then is described as follows by the three government experts named:

"We have been accustomed to think of oil and gas as a small item in comparison with coal. This opinion was perhaps justified in prewar years, when oil and gas furnished only ten or twelve percent of the total energy supply, but it will have to be scrapped now that in 1923 oil and gas had so far increased as to contribute 26 per cent of the total energy from mineral fuels. In 1918 oil and gas contributed only 15 per cent of the total energy from fuels. To put it another way: in 1918, the heating value of coal was to the heating value of all oil and gas nearly as six is to one. In 1923 the ratio was as three is to one."

For the purposes of their study these experts reduced all known forms of energy to their equivalents in British thermal units. On that basis they set up an index number of 100 for the year 1918, by which it is possible to measure the growth or decline of any of the industries contributing to the nation's supply of energy for heat, light or power.

"It would be misleading," says the report, "to contrast years like 1919, 1921 or 1922, which were marked by strikes or general business depression, with the prosperous year 1918. Instead, let us take 1923, when general business was booming and the coal market was stimulated by the demand for extra tonnage to build up the depleted stocks. In comparison with 1918, the output of anthracite in 1923 had fallen six points and is represented by the number 94; the output of bituminous had fallen three points and is represented by 97.

"Contrast this with the change in oil and gas. Production of domestic oil had more than doubled, rising to the index number 205. Natural gas shows a large increase. Imported oil, which has now become a large factor in the energy supply of the country, rose to three times the 1918 rate in 1922, and even in 1923 stood at index number 218.

Left and right—Comparative contributions to the United States supply of energy for heat, light and power.

Circle—Total energy consumption of the country.

Left — Declining output of coal.

Right — Increasing oil production.

Thus, while the total supply of coal had declined in importance, the total supply of oil and gas had greatly increased. Adding together all the oil and all the gas, their sum in 1923 was 91 per cent above that in 1918.

"Even water power has shown a material increase. There is no complete information as to the number of horsepower hours produced from water, but the best estimates available indicate that they rose from 1918 to 1923 by 30 to 35 per cent. Now by combining all the sources of power into one index number, we can tell whether the country's total demand for power has been declining. If the total heat units, contributed in 1918 by coal, oil, gas and water power put together, be represented by the number 100, then the heat units contributed in 1923 by all these sources are represented by the number 112.

"In other words, the total energy consumption of the country instead of falling off in 1923 showed an increase of twelve points over even 1918. Remembering that this index represents energy units produced, without regard to the fact that utilization in the meantime has become more efficient, it appears that the country's appetite for power and heat has continued to increase at a rate very close to normal. An increasing rate of total energy consumption coupled with a decreasing rate of coal production shows very clearly that some other source of energy is displacing coal."

One of the first official recognitions of this condition was made in 1922, when Messrs. Tryon and Sydney A. Hale wrote a report entitled "Coal in 1922" for the United States Geological Survey.

In that it was pointed out that the increase in coal consumption had long been recognized as a barometer of the growth of American industry. Professor E. E. Day, of the Harvard Committee on Economic Research, estimated this annual increase of coal demand at 16,800,000 tons.

"Since the war, however," says the Geological Survey report, "no such rate of increase in output has been maintained. It seems clear that the annual rate of increase of the prewar years can no longer be accepted as the measure of the normal production of soft coal. Various factors have combined to bring about a slowing up of the former rate of increase. They include economies in the utilization of coal resulting from the high prices of the last seven years; competition of

(Concluded on page 24)

Above—Comparative waste heat between beehive coking and the by-product system.

Relative amounts of coal required to make a ton of pig iron.

Efficiency increased 25 per cent in making kilowatt hours from coal.

# The Search for a Good Story

By THOMAS L. MASSON

ILLUSTRATED BY W. O. FITZGERALD

THE easiest reading story I have read this year is *The Great Gatsby* by F. Scott Fitzgerald, and the hardest reading but perhaps the best current novel is *Arrowsmith* by Sinclair Lewis. The one on account of its style and character I enjoyed the most is *The White Monkey* by John Galsworthy, and the best American story by a woman that I have read is *Barren Ground* by Ellen Glasgow. Chatting with her recently, I told her as much, although Edna Ferber, author of *So B'g* happened to be standing right back of us. But I am inclined to believe that Miss Ferber might agree with me, as she is a truly modest person.

Sit down and read Mrs. Wharton's last book *The Mother's Recompense*, take time to do it, don't skip, give yourself up to it, and believe me you will get a new joy, not alone out of this particular book but out of the others that come to your net.

There is one thing about which we are already agreed, and that is the sincerity of a writer. He can violate any rule but that and still make good with us, assuming, of course, that he has the ability. Occasionally we see this demonstrated in a startling manner, as, for example, the extraordinary vogue of what is practically a first novel by a young English girl, namely *The Constant Nymph* by Margaret Kennedy. Here is a book which has met with a storm of approval on both sides of the Atlantic. Those who are familiar with novel-writing technique can see quite plainly that the author is new at her craft, but that makes not the slightest difference. She sweeps aside everything in her unerring flashes of character delineation. Let my readers take this book, Mrs. Wharton's *The Mother's Recompense*, and, say, Jane Austen's *Emma*, and note the differences and also the parallels in style and thought.

Another English woman novelist, still very young, but of whose work I am inordinately fond, is Sheila Kaye-Smith. She draws the English farmer with amazing profundity; one can linger over her books, the most recent of which is *The George and the Crown*, with unfailing delight, always provided that one is willing to give the time to them that they deserve.

Not only as readers must we ask about any book the fundamental question, but we must go further than this and enlarge upon our questions:

Is a book interesting? Does it teach us anything? About human nature? About types? About races and countries? About history? Is it just something to kill time?

We should not assume that the last class of novels is necessarily useless. As a matter of fact, so-called light reading—stories of action—may be extremely valuable. They have been so considered by some of the greatest men. Macaulay, one of the masters of English prose, revelled in "trashy" novels. So, in this country did Woodrow Wilson and other big-burdened persons. These books are a useful asset under certain conditions.

In America the classic detective story is *The Leavenworth Case* by Anna Katharine Green, which still has a steady sale. In Great Britain no one has yet reached the high-water mark achieved by Conan Doyle, and probably no character in fiction has a more definite outline than that of Sherlock Holmes: or has had more imitators. As for action—high doings on the high seas and murders, mysteries and rescued maidens on land—there has scarcely been a period in the whole range of literature which contains so many noble adventures in books as the present.

The reason why we have all these great doings in novels, and so much talent in the writing of them now being developed, is perfectly plain. It is due to the demand, and the demand is due to the lack of romance and adventure in our own lives. *The call of the wild among us was never so insistent as now, because we are being so tamed by our own civilization.* Everything is being anticipated except our need for shockers. The chance of rescuing any lone maiden from a tall tower, or snatching her loose from a band of cutthroats, seems now to be gone. This lack of real life also accounts for the sex novel. The savage in man finds a certain sublimation, or relief, in cave-man stuff on one hand and the erotic on the other.

There is, however, a much better reason for reading novels, or at least one that seems more important, and that is their power to keep us in touch with what is going on all over the world, not only outside but inside of the minds of human beings. In no other way can we learn how other people live and how they think so well as through the modern novel.

Approximately one hundred new novels are issued every month in this country and England, and nine years ago more were issued than at present. The reason for this is due to the greater care today exercised by publishers in the selection. Among this bewildering array of novels, it would be quite impossible to give due credit to all.

"The call of the wild among us was never so insistent as now."

Cable ship *Dellwood* in Resurrection Bay, Alaska.

# Hitching Up to Alaska

## An Epic of Effort by Which Remote Places Were Put in Cable Communication With Busy Centers

IN THE remote places of Alaska the government telegraph office is the center of the social, political and educational life of the community. News of the outside world that is contained in press messages is copied by the operator and posted upon a public bulletin board where there is no local newspaper, and market reports are posted at every office. Isolation, the bane of frontier life, has thus been ended in this region.

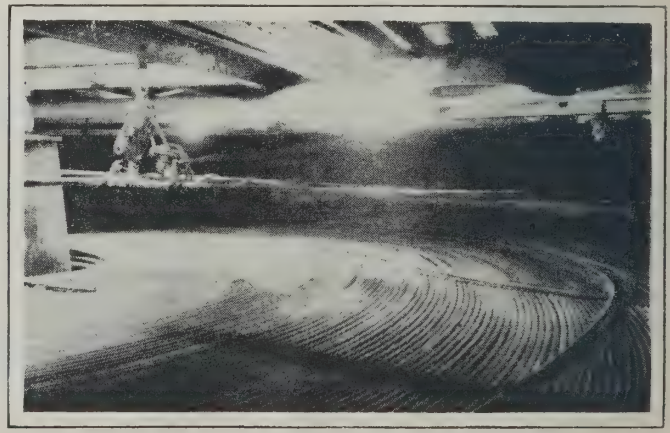
The Washington-Alaska military cable and telegraph system is a splendid example of the Federal Government in action. This system of 2,655 miles of submarine cable between Seattle and Alaska and along that coast comprises 20 radio stations and 840 circuit miles of telegraph line connecting 44 offices and is operated by the Signal Corps of the U. S. Army.

During 1924 the Alaska system handled 223,031 messages, the commercial revenue amounted to $273,-315.69 and the government messages were worth $135,521.69. Press rate messages aggregated 2,595,215 words. A ten-word message between Seattle and Juneau costs but one dollar and the same message sent from Seattle to Fairbanks, the interior metropolis, costs two dollars. Money transfers are made by wire and in nine Alaska towns a messenger delivery service is furnished.

The Alaska system of communication was projected in 1900 when the rush of newcomers to the upper Yukon gold fields created a new law and order situation for military headquarters at Fort St. Michael, above the mouth of the Yukon, and Juneau, the capital.

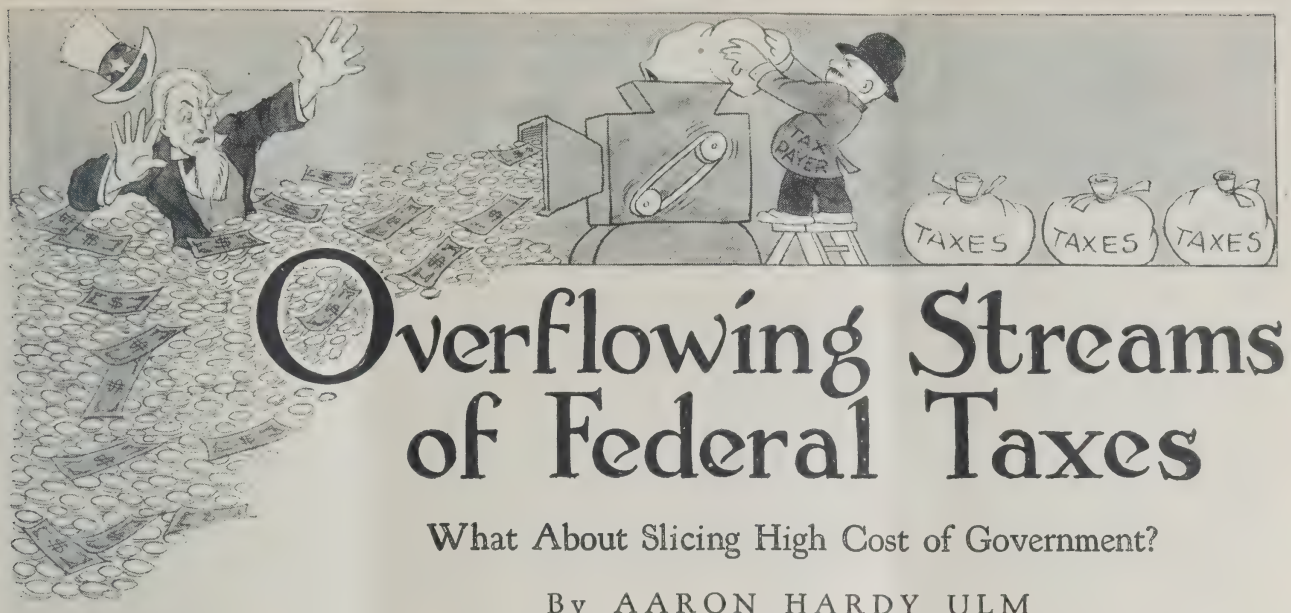
The first line was built overland from St. Michael to Fairbanks, 825 miles, thence to Fort Egbert, 1,164 miles, near the international boundary, where connection was made with the Canadian line that extended from Dawson, in the Klondike, south over the White Horse Pass to the Port of Skagway. Another line was built from Valdez 330 miles north over the all-American route to the gold fields where connection was made with the line to Fort Egbert. Cables were laid from Juneau to Skagway and from St. Michael to near-Arctic Nome.

Communication between the Alaska-Yukon regions and the rest of the United States and Canada was first established in September, 1901, over a line between Dawson and Ashcroft, a station on the C. P. R., in British Columbia. Sir Wilfred Laurier, then Premier of Canada, had the vision to push the construction of this line through the trackless wilderness of Northern British Columbia and the Yukon Territory.



The construction of the land lines in Alaska entailed struggles with heavy rains and excessive heat in the short summers. Hordes of the Arctic mosquitoes that infest the stagnant waters of the tundras and sometimes rout the bears drove the men to the verge of insanity. The winters brought deep snows, low temperatures and high cutting winds. There were cold and rapid glacial streams, steep ridges and mountain ranges, cañons, thick timber, and swamps. Four experienced army parties spent two years in finding a route between Rampart and Circle, 80 miles, that could be traversed by the explorers, let alone building a telegraph line. Every pound of food, forage, tentage and line materials had to be moved by pack animals and fifteen miles a day was as fast as they could travel over the new "trails" of the line routes.

This original system was completed in 1903 by the now Colonel William Mitchell, who subsequently became famous as an exponent of aeronautics, which was an activity of the Signal Corps until after our entry into the World War. It will be recalled that the military use of airplanes was purely as a signaling device until the World War demonstrated the positive combat possibilities of the machine which gave Colonel Mitchell a new field for strenuous effort.



During the first summer more than one hundred miles of the most inaccessible lines were destroyed by forest fires, but the damage was repaired before winter. The frost coming out of the ground in the spring heaved out the poles in the numerous marshy reaches and these poles were replaced with tripods.

A chain of log cabins about forty miles apart was constructed to house the permanent repair force. One repairman and two assistants were stationed in each cabin. Food and material sufficient for one year had to be provided to avoid the danger of starvation. The danger of accident along the trails was such that men were not permitted to go out on repair work singly. Summer with its heat, bogs and mosquitoes was even worse than winter.

The cable between St. Michael and Nome was torn to pieces by the Arctic ice pack that swept the foreshore of the open roadstead upon which Nome is built. The Signal Corps met this challenge of rude nature by designing and building the first (Concluded on page 30)

Cable tank in the *Dellwood*.

# Overflowing Streams of Federal Taxes

## What About Slicing High Cost of Government?

By AARON HARDY ULM

—Washington.

TAXES must come down, says President Coolidge; and the sentiment is echoed heartily by leaders on all sides in Congress. Around a big table, in a big room of the Capitol, the House of Representative's ways and means will assemble on Monday, October 19, and begin the work of paring. The committee is to prepare in advance the tax reduction and revision bill which is to be the outstanding measure before Congress when it meets on Monday, December 7.

The bill will sound rock bottom as to the aggregate of Federal taxes, possibly for all time to come. Only curtailments verging on the revolutionary ever will reduce the cost of the government below what is scheduled for the next fiscal year. President Coolidge and his lieutenants in his continuous fight for economy expect to hold the total of that cost, for other than the Postal Service which is mostly self-supporting, to around $3,000,000,000. This will be bedrock for the costs that are met chiefly by taxes.

During the last fiscal year, the government took in $250,000,000 more than was called for by scheduled needs. Present tax laws, if operative throughout the period, will yield for the fiscal year ending June 30, next, another surplus of $400,000,000 or more. Thus it would seem that Congress easily can proceed with the view of slicing the aggregate tax toll in the extent of at least $300,000,000, or around 10 per cent of the whole.

But Congress can't or won't make a horizontal slash. There will be big cuts in some of the taxes, little ones in others, and in many none at all. Therein lies the element of revision, around which most of the controversy will revolve, and expand the reports of the committee hearings and, later, the *Congressional Record*. There will be much scrambling for the slices of varied size and potency which Congress will knife from different chunks of taxes.

Taxes pour into the Federal Treasury from three main streams, each of which is swelled by pourings from numerous subsidiary streams. Yields from the three principal ones during the last fiscal year were as follows:

| | |
|---|---|
| Customs or taxes on imports | $ 547,500,000 |
| Miscellaneous internal taxes | 828,600,000 |
| Income taxes | 1,760,000,000 |

The first comprise a toll taken from $1,528,642,469 worth of dutiable goods brought in for consumption from foreign lands.

The second is made up of the great assortment of taxes levied on certain products produced in the country, such as tobacco, automobiles, and numerous things rated as luxuries, and also those put upon the estates of descendants who leave property worth $50,000 or more.

The third is made up of taxes paid on incomes by individuals and corporations, from which latter is derived more than half taken from this biggest of all streams.

Neither reduction nor revision will be in all the tributaries of any one of the main streams, though the total flow from two of them will be curbed.

One, the tariff, is not likely to be disturbed, though it may hover formidably in the background throughout the proceedings. Those leaders who will have most to do with reducing and revising elsewhere are arrayed against meddling with that troublesome and trouble-making branch of taxation, through which there flows "painlessly" into the Treasury more than a half-billion dollars a year and several times that much perhaps into other benefiting precincts.

Some of the so-called "nuisance" taxes will be abandoned, some others reduced, and others not disturbed at all. For the slices knifed off here there will be much demand from variously affected interests, barring the most affected of all, the buying public, which pays these, like the tariff and most other taxes, usually without knowing it. The biggest controversy—miscellaneous internal levies—probably will be over the estate of inheritance tax, which the administration would abandon altogether, on the theory that this kind of taxation should be left to the states, which sometimes join with the Federal Government (Concluded on page 27)

"There will be big cuts in some of the taxes, little ones in others."

# Introducing Ye Olde Walking Stick

## Canes Have an Ancestry Which Dates Back to "Methuselah's Great-Grandfather"

By WALTER M. WOLFF
ILLUSTRATED BY W. O. FITZGERALD

DO YOU have the swagger habit and seize your little old dogwood, bamboo, Malacca cane (or just plain sapling) by the neck whenever you leave the house for a stroll or a walk to the office? Is a cane your daily companion as it trots along gracefully by your side or is swung to and fro so that you enjoy the perfect freedom of the sidewalk? If you do (or do not) it doesn't matter one whit. Certainly there's no harm in it and that's precisely what canes are for—they enjoy being fondled and swung about and "tamp-tamped" freely on the hard pavement. Every respectable walking stick is as well-shod as brewery horses used to be. Furthermore, it's a safe bet that if canes could talk they would voice loud protests against being frequently forgotten when their owners leave the subway or lock the office at night. Certain it is that they do not deserve such treatment.

Did it ever occur to you that even *your* cane has a just reason to be proud of itself? That it can trace its ancestry back much further than you had ever supposed? Well, the fact remains that canes are older than Methuselah's great-grandfather—even Adam must have loved and cherished his faithful staff, *next to Eve, of course.* But let us see, briefly, what can be brought to light, historically speaking, on the subject of walking sticks.

A Spanish physician says that man inherited the cane from the apes and that it is therefore a fitting memorial to the prehistoric age. At any rate, it is certain that canes were in vogue with the Roman emperors and numerous archeological finds have disclosed the fact that walking sticks very similar to the present article were used at that time. The Germanic peoples, however, did not take a fancy to the cane and it was not until 1500 that shorter than man-size staffs came into popular usage. Charles the Fifth, for example, is said to have possessed a very modern walking stick made of tortoise shell and no doubt many gentlemen of his day followed the worthy Karl's example.

About the year 1750 it became fashionable even for women to use canes. The fair ones were quick to adopt the walking stick, presumably to appear interesting to "mankind." A lady would lean lazily and languidly upon her slender stick so that thereby she might look meek and weak and excite sympathy, or at least attract attention. (And yet we say the flapper is a post-war product and a modern innovation.) Hereupon the males adopted the custom of carrying canes with the result that the sticks now became stouter and less ornamental. But canes by this time were considerably lighter than, for instance, the one owned by Peter the Great which weighed 5 pounds.

In England the extensive use of oak sticks began with the supporters of the Stuarts who were driven out in 1688. Hereupon reed canes fitted with horn or metal handles grew popular and we find that also on the Continent the reed cane dominated until about 1810. Canes of fine wood, bone or metal had already begun to find favor in England and in France, and not a few of these were very artistically chiseled, carved or engraved so that they might even be classed as ornaments. In 1812 appeared a cane which created quite a sensation. It had a crook or head which threw a shadow resembling a profile of Napoleon.

Something radically new in the line of walking sticks appeared later upon the discovery of electric illumination. Still others were invented which could be used as weapons of defense and emitted electric shocks or served to disable an antagonist for a short time. Certain canes have also been made which can be converted into tables or chairs while still others serve as inclosures for umbrellas, camera tripods, and so on. King Edward, when still Prince of Wales, had a large collection of unique sticks, among which was one used by Queen Victoria. This specimen was cut from the limb of an oak tree in which Charles II found refuge from his pursuers in 1651. Another cane was made out of a piece of wood from one of the piers of the famous old London Bridge. Most of the collection contained examples of cane artistry from India and some beautiful specimens of wood and ivory carving were among the lot.

The most costly cane in the world is said to have belonged to a New York man. This stick had an 18-carat gold handle surrounded by sixty-three large diamonds. A gold snake with ruby eyes wound itself around the wood, and mounting the handle itself was a watch in a setting of a further twenty-four genuine diamonds. To a much less extent, perhaps, this cane reminds us of the familiar gold-headed affairs of the last generation when every country squire and city dude considered it a mark of distinction to own one.

More practical, however, is a likewise expensive cane invented by a German doctor which contains all the chirurgical instruments necessary for minor operations and, in addition, carbolic acid, anesthetics and bandaging materials.

Our modern canes of today are not always as unusual as the above-mentioned but with us the quality of the wood now makes all the difference—and the price. We seldom find walking sticks with fancy carving or engraving still in use but the connoisseur of this day is very particular about the kind of wood in his cane. In Europe, at least, a cane is not a cane unless its wood is Malacca, rosewood, dogwood, or some other choice and scarce product of the antipodal forests. Malaccas are most in favor with the élite.

# MR. FORD'S PAGE

WAR will never be stopped by the pacifists and peace will never be won by the war-makers. Both are products of the same disease that is seeing its last phase in human society.

As long as there exists on earth the warring type of mind, and it has instruments to execute its purpose, war is possible. But, as was shown in the last war, the military strength of the peaceable, the non-war-making nations, is greater than those of the war-making nations. And, strange as it may seem, that strength has increased.

One sign that the world is growing better is that the non-war-making nations are strong enough to curb the war-making nations. War, as a method of accomplishing anything, is now resisted and in the future will be more and more resisted, until even the war-making mind will learn the futility of it.

That is the fallacy of disarming the non-war-making nations. Can you imagine the United States starting a war? Can you imagine the United States refusing to crush a war started against it? With these two views, can you imagine anyone starting a war against the United States?

It is not our well-known inclination to peace that guards us, it is our well-known disinclination to stand for anyone disturbing our peace.

It is just here that the fallacy of professional pacifism is seen. Pulling the teeth of the watchdog and letting the wolves run free is not the way to bring in the prophet's vision of universal harmony. The rest of the world knows it has nothing to fear from the force and power of the United States, but all the world knows that the United States would not be safe for long if it were helpless to defend itself.

Pacifism is an excellent doctrine if preached to those parts of the world where the war-making mind is rampant. To arm the bandits of the world, and disarm its law-abiding citizens, is not the way to stop international holdups. Counseling the decent citizen to disarm himself as an "example" to the thug indicates unfounded confidence in the thug's susceptibility to Christian example. It is a pious fiction, than which none nearer apes a lie.

And militarists are just as helpless to bring peace. They are specialists in force, just as pacifists are specialists in sentiment. They do not, perhaps they cannot, take in the whole situation. The worst of them have won wars; the best of them have never won a peace.

We mean no cavil at them. At any rate they are soldiers, their lives are their country's; they have the highest code of honor; at critical times they have saved the citadel of civilization. But when we consider things that are to be, we cannot say that the military world, even at its best, contains the secret of progress.

It is coming from the people. The people are not going to become as soft as pacifists would like to see them, nor as hard as extreme militarists desire; but they are going to excel in the strategy of common sense. The fact that our people are not war-starters is not going to prevent them from being war-stoppers, and such effective war-stoppers that war-starters will hesitate.

*WAR is not a matter for the professional pacifist or militarist. It is for the unprofessional people. They finance and fight it, they bear its losses. Therefore, they should have the deciding voice concerning it. To do this, they require all the information upon which decisions are made. They should know, in a difference, whether it is soluble by rational intelligence, or inevitably by force. Not once in a thousand instances would our people (this may not be true of all peoples, however) approve an offensive war. Never would they be lax in defensive action. For this is their country. However, most of their enemies are within it.*

This does not go for all the people of the earth, as yet, but for certain nations. Some nations will probably try to start and have to be stopped once more before the lesson is thoroughly learned; after that, better sense.

It is worth observing that the peace spirit is rising in those nations which have been most successful in their wars. "Most successful in their wars," means most successful in stopping wars. These nations have spread and become powerful, but they have never indulged delusions of world domination. All the big war-starters have had that delusion. The war-stoppers have not had it. Yet the war-stoppers got the dominion. Blessed are the war-stoppers, for they shall inherit the earth which the war-starters hoped to get.

With this power the ability to stop wars will go forward a step. We shall become able to stop wars before they start. We shall do that not only by having undoubted ability to outfight the fighters, but with that ability we shall also have the greater ability of statesmanly management of problems, a spirit of justice in settlements, and a spirit of service in relations. These invisible, these intangible things, shall be our strongest weapons. For, after all, real power is invisible.

In the invisible world, not only of the idea, but the higher, right-directed world which we indicate by the term "ideal," the power of the future will be found.

## Interest

THE people of a few hundred years ago resisted the introduction of the interest system because they believed it would swamp the world, destroy it. They regarded it as a new disease creeping upon humanity. It is a viewpoint strange to people living today because we do not question the origin or the logical end of our practices.

Take the question of interest as it relates to the international debts. Here are some figures which indicate the weight of the interest burden laid upon six countries before their debts with the United States can be settled:

Poland owes $178,560,000. Add $257,127,550 for interest.

Belgium owes $417,780,000. Add $310,050,500 for interest.

Great Britain owes $4,600,000,000. Add $6,505,965,000 for interest.

And so on down the list. Little countries like Finland owing $9,000,000, but being charged an additional $12,695,055 for interest. Lithuania paying $8,501,940 interest on a debt of $6,030,000. Hungary with a debt of $1,939,000 being charged $2,754,240.

Here is a colossal interest bill against only six nations for more then Seven Billions of Dollars.

## They Came, Won and Went

THE French debt commission came, discussed, went away. They got what they wanted, which is an extension of time. It came under the guise of a settlement. The United States negotiators who would not think of accepting twenty-five millions as a decent payment, accepted forty millions, which is a slight fifteen millions more, and of inconsiderable moment in the whole transaction. Judging the occasion in terms of victory and defeat, the American negotiators met defeat. It may be just as well; any persistence on our part would have disclosed to the world the real condition of France, which is little short of desperate. An understanding is about all that could be expected under the circumstances, and the proposed payments are gestures, a trifle more substantial than promises. About the conduct of the negotiation, the least said, et cetera. It started out like a long-distance poker game played through the newspapers. Bluff was put up to expose bluff. Both bluffs were called. The result is—an understanding.

## "A Nation of Gadabouts"

A PUBLIC speaker recently said that we were a "nation of gadabouts." The desire to wander is deeply planted in the average American, but it is noteworthy that it is never very long before he is "back home" again. It is only natural that the nation which has developed modern transportation should swarm over the earth with an ease undreamed of by the pioneers.

The "gadabouts" may be divided into two classes—those who travel for profit and those who profit by travel. Some travel for business and some for pleasure. The number of those who do both every year is increasing. People travel most in times of prosperity, and American prosperity is the wonder of the world—principally because it is a prosperity based on work.

"Gadding about" is good for the country. It enables the people of one part of the country to become acquainted with those of another; it obliterates misunderstandings and misconceptions.

A narrow parochialism is not good for any land; the only way to diminish it is by "gadding about."

From Canada to the Caribbean Sea, from Cape Cod to California, we have a wide field from which to choose. It is not the fault of the country if we fail of the lure to do some "gadding about."

## Cut a Pumpkin

WE LOST something when we carried civilization too far and raised the can opener to such high estate. Not that the can opener should be cast out wholly; it has helped, and no housewife will deny it.

But there was a fine flavor of tradition in the old, old house which had its broad, bright, beamed kitchen, with perhaps a crane in the chimney place. A family was somehow tied together and to its home by a pantry full of homemade goodies of all kinds.

It takes the crisp airs of autumn to recall this to our minds. So many of us had our beginnings in old-fashioned homesteads, and have gone far away from them.

But you can recapture a whiff of this delightful aroma—even in a crowded city house, in a flat, or on a farm that has gone over entirely to the mail-order house. Make mincemeat, or Christmas pudding. Cut up pumpkin for pies.

## *A Crime Report*

MURDER in Europe is decreasing and suicide is increasing, says Professor Enrico Ferri, Italy's greatest criminologist. He submitted figures that indicate that murder in Europe has been on the decrease since the Middle Ages and suicide has been on the increase. In Southern Europe where more murders occur than in the north, suicide is more rare.

Professor Ferri said that when Italy abolished capital punishment for murder in 1890, catastrophic predictions were made, but murder has been distinctly on the decrease there since that time.

The value of the above conclusions are that they are based upon a study of data. Professor Ferri's fact-finding approach to the question is in violent contrast to the curbstone or horseback opinions that comprise the vast bulk of the comment upon crime and other social questions. We still believe what we want to believe about those things because quite often we lack the moral strength that is required to readjust ourselves to the facts.

## *Are the Women at Work?*

THERE is strange silence in the women's camp. After the defeat of those great efforts which were made to put a Child Control amendment into the Constitution, and the protest that it was intended to be only a Child Labor law, many supposed that the women would continue their work for the children in the most proper and productive way, namely, through the state legislatures.

If the object of all the recent excitement was to benefit the children in states that may still be remiss in protecting their children, it was expected that a new concentration of influence and pressure would be brought to bear upon those states, in behalf of the children about which so many moving tales were told.

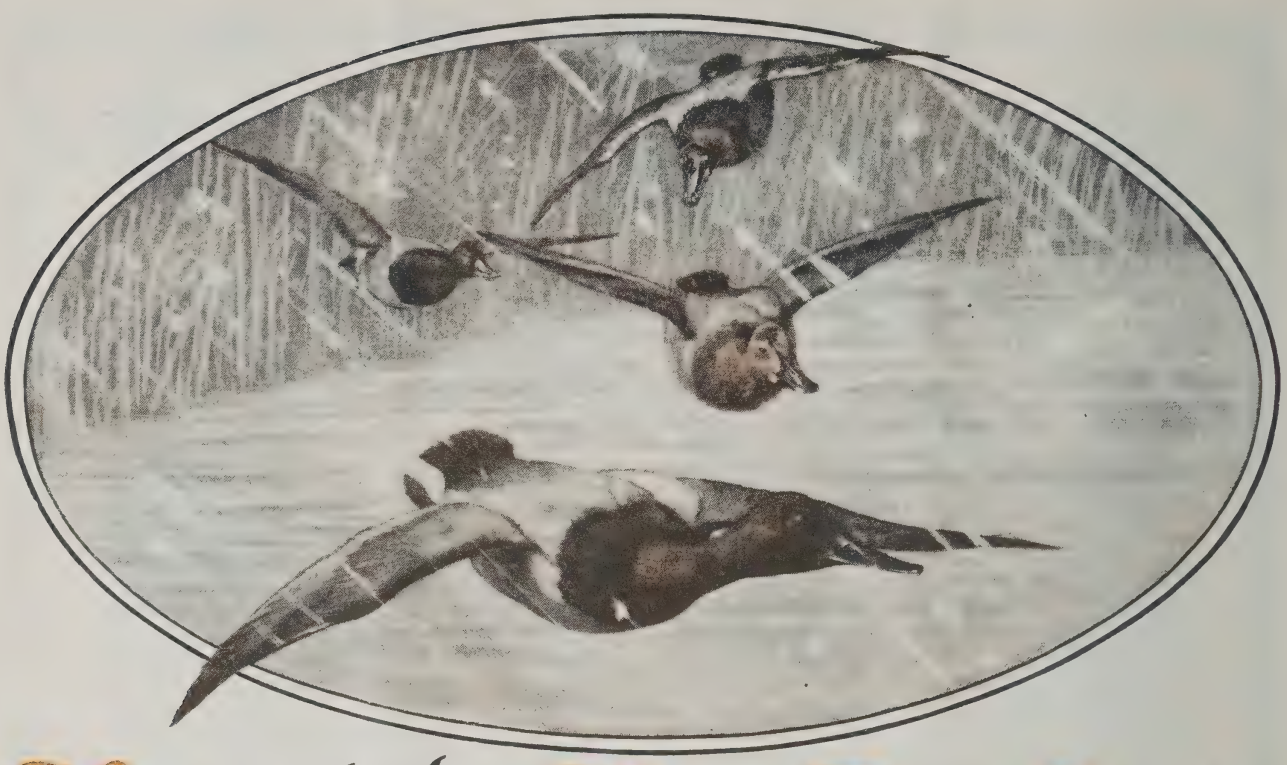
But it seems not. There is no news of anything of the kind being done. The plight of the children seems to have served its turn in speeches and pamphlets. It does not seem to be real enough to evoke state campaigns.

In other words, the Amendment and not the Children seems to have been the main issue. When the Amendment was defeated, the Children seem to have been dropped. Politics seems to have been a bigger object than Humanity.

We are saying this to the so-called political leaders of the Women's movement in America, and to call attention to the fact that most of the so-called welfare measures significantly lost their humane significance as soon as the political object was either attained or lost. Winning or losing seems to have made no difference in this denouncement. Bureaus established to look after mothers, and other bureaus to look after children, seem to have been distinguished by doing neither of these things in any conspicuous way. The objective was the establishment of a Bureau, it seems, and the objective of the Bureau was the support by Government salaries of women whose real alliances were sometimes anything but friendly to the Government.

In the case of the lost so-called Children's Amendment, the work for children stops. If it were primarily for the children, would it not have gone on? Is it not easier for Women's Clubs to reach their local legislatures than to reach the big Congress and the Constitution? The women of any state can do anything.

Why not State's rights for Women? Why should Women's Clubs be discouraged from engaging in needed work in their own states?



## *Just a Century Apart*

IN THE year 1825, the British Government offered a prize to the owners of the first steamship which should complete the voyage from England to India in a specified time. In those days, such a project appeared to many people a freak idea. Nevertheless, the paddle steamer *Enterprise* took up the challenge, and, on August 16, 1825, sailed from Falmouth for India. Some four months later, namely, December 8, she reached Calcutta, well within the stipulated time, and won the prize.

Today, the British Government is arranging preliminaries for the establishment of a commercial air route to India, and it is expected that the distance from London to Calcutta will ultimately be covered in less than a week.

At the moment there is remarkable correspondence between the development of steam transport in the nineteenth century and aerial transport in the twentieth. It will be interesting to see how long the correspondence will continue. If the analogy between the two centuries holds good, the extension of aerial transport will be slow. But analogies in these days are strangely unreliable. The movement of science is ever a steady acceleration and it may not be many years before, as one authority has well put it, "the network of air routes which is already spread over Europe extends its ramifications to the furthest part of the globe, and the air competes with the ocean for intercontinental traffic."

In these days, where science is concerned, the dictate of wisdom is ever more and more to "expect the unexpected."

# King of the Wild Rice Beds

## Where the Mallard, Monarch of the Marshes, Feeds on Its Southward Flight

By DONALD HOUGH

THROBBING with life is the wild rice bed of the north when autumn comes.

Through the summer it has been getting ready for its rush hour. For here the mallard duck, lord of the marshes, and the little teal and the awkward black coot breed and rear their young and lead them through the intricacies of their first swimming lessons. All summer the rice stalks wave green in breezes that sweep sparkling lakes. There is a subdued activity among the wild life; but the rice bed is deserted by men.

Alive in its hour in the sun is the rice bed when the stalks are dry and the grain ripened, and ducks are on the wing restlessly preparing for the migrations.

When the rice stalks get brown, first comes the Indian to harvest his ancient cereal. From all the country around whole families come to gather the rice by pushing their canoes through it and knocking the loose grain into them with sticks.

After the Indian, comes the hunter. Hunting cabins that have lain dormant for a year show wisps of smoke at the tin chimneys; there is a smell of fresh paint as the flat, frail little duck boats are given a new coat, and the wooden decoys are made more closely to resemble the brilliant plumage of their live counterparts.

The stately mallards have taken wing, and they circle the rice marshes in pairs and flocks, quacking loudly like their vulgar adaptation, the barnyard duck. The little teal, smallest duck beside the largest, dart here and there, or rise in big black flocks like the droves of blackbirds that are descending on the marsh to fill their crops before taking high wing for the south. The coots, lowest in wild-fowl circles by the standard of white men, but highest by the standard of the Indian, are here in great rafts, feeding constantly, their faint individual chirps rising collectively like the roar of a waterfall all over the rice beds.

Of all these, the mallard is the first objective of the hunter. Here is a big bird, a beautiful duck; and here is one which puts all of the wiles of the hunter to the test. Close to the hearts of all hunters is the mallard. Of all ducks, he was the one selected by man for domestication; and save for a more trim and graceful carriage, a stronger wing, he looks like the fowl of the farmer's pond.

The mallard is the wisest of all ducks. After the first day of the hunting season he knows where the hunters are to be found, and avoids them by enough distance to render him safe, yet close enough to cause a quickened heartbeat and an intense interest on the part of Nimrod. He is a circling bird, wary, but a great decoyer, this mallard. It seems as though from the beginning of time the mallard has been gregarious to an uncommon degree, even among ducks. Never a lone bird but is looking for a party of its mates; never a small company but will listen eagerly to the calls of a larger flock that is feeding in the tall rice.

The lone mallard, for some reason or other, symbolizes the essence of duck hunting. Alone, through the diversities of feeding or of fate, he circles the marsh, high in the air, quacking loudly and bending a willing ear to the answers of his fellows below. Having decided to join the party, whether it is one composed of real ducks or whether it is a mere collection of wooden dummies aided by an artificial duck call at the lips of the hunter, the lone mallard is in no hurry to alight. Time and again, with a studied hesitation which the nerves of only the oldest and most experienced duck hunters can withstand, he circles the decoys. More than once he seems to have made up his mind, only to change it again and resume his cautious investigation. His head moves from side to side as he flies, and his little eyes are never quiet—well made must be the blind, well painted

the decoys, that escape them.

The little teal, diminutive companion of the mallard in habitat, while not sought after as the larger bird is, still is not disregarded by the hunter. It takes a good hunter to lure the mallard; it takes a mighty shot to hit the speeding teal. Like a bullet barrage come the teal, over the trees that surround the big marsh, over the heads of the hunters sitting in their little boats concealed in the rice.

The teal go directly from one place to another without any fuss, and their speed is meteoric. On quivering wings they dart in, rocking from side to side, tearing into the air and through the wind. When fired on, a slight manipulation of their wings sends them zooming up into the sky—a twist, a turn, and they are out of range.

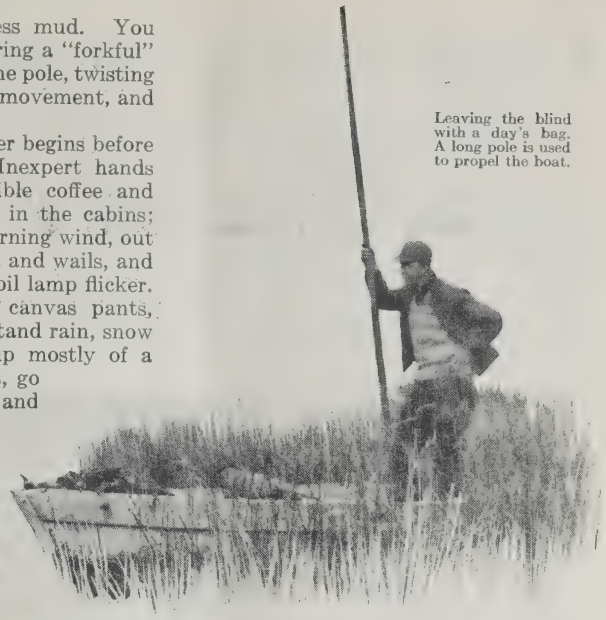
The coot, clown of the rice beds, is sought only when everything else fails the hunter. Poor, clumsy flyers, stupid swimmers even, these black fowl with white bills fall easy prey. But they are in the rice by the tens of thousands. When the weather is still, the water in the open places calm, they congregate in great rafts in these breathing spots, moving slowly in unison, this way and then that. A body of coots gets up with a roar, for they must each run a few rods on the water before trusting entirely to the air. And when they settle down again, which they do in no time at all since they dislike this business of flying, they must extend their toes cautiously as though to test the water, to see if it is warm enough for swimming before intrusting their precious bodies to it again.

The coots fray the nerves of the hunters, for their incessant murmur as they feed rises, all day and all night, like the humming of a thousand electric wires, from all parts of the rice beds.

Duck hunting has enlisted millions of advocates in America; it is the most ardently adhered to of all our sports afield. But duck hunting, especially duck hunting in wild rice, is hard work, and usually wet and cold besides. Aside from the matter of food, the ducks might well have selected the rice beds for their protection. It takes a boat with little draft and a prow as sharp as a knife, and it takes a man with more than the usual amount of patience and skill and a good allowance of muscle, to push through it.

Oars are unknown for propelling the boat. A pole, long enough to give the boat a good push at each thrust, is standard equipment. The stick has a Y at the end, but even so if you do not know the trick of rice navigation you will simply push the pole into bottomless mud. You must be adept at gathering a "forkful" of rice in the crotch of the pole, twisting it securely with a quick movement, and then pushing.

The day of the hunter begins before the rise of the sun. Inexpert hands fry eggs and boil terrible coffee and cremate slices of bread in the cabins; while the cold, gray morning wind, out of the northwest, shakes and wails, and makes the flame of the oil lamp flicker. Hip boots, waterproof canvas pants, stiff coats built to withstand rain, snow and wind, and made up mostly of a labyrinth of big pockets, go on over thick sweaters and snug leather vests.



The light in the east is still cold and forbidding as the frozen mud and frosty grasses yield and crackle under the heavy boots. The whistle of wings is already in the air, and the quacking of the mallards out in the rice rises above the rumble of the wind, the rustle of dead leaves and the omnipresent whisper of dry rice stalks.

Slowly the boat moves through the rice, pushed laboriously by the long pole, stopping short as soon as the pressure ceases. Ducks appear in the dim light, coming suddenly out of the void, disappearing suddenly into it.

The boat reaches the edge of an opening in the rice, and out go the wooden decoys. The hunter arranges prepared bundles of rice stalks over and around his boat, and he is ready for the first birds.

Slowly the light comes, and the ducks are in sharp relief against the sky. One of the contradictions of Nature is that an unwieldy duck, a puddler of the marsh, becomes the speediest of birds, a creature of unsurpassed grace, when in flight. Every sweep of a flock, every glide of a "single," is done in curves that are perfect in rhythm.

At the first shot fired, there is a great roaring of wings all over the rice beds. Mallards—hundreds and thousands of mallards—are rising into the air. Slowly they circle, gather into flocks, divide and re-divide and leave the marsh. Does the sight of all these ducks departing for other breakfast tables strike dismay to the heart of the hunter? Not a bit of it. That is just what he wants. The mallards will come back. All day long, in small flocks, in singles and doubles, they will drift back. And when they circle the rice beds looking for a favorable place and for company, the decoys will get in their work.

Leaving the blind with a day's bag. A long pole is used to propel the boat.

The roar of feeding coots rises over the marsh; great flocks of blackbirds drift like clouds over it; teal ducks scoot around like shots from some distant cannon. High over the marsh other ducks appear. These fly in compact formation, businesslike in demeanor, and some of these flocks drop down on whistling wings for a quick lunch on their way to the south. These ducks are of other kinds: redheads, and the delectable canvasback; the racing bluebill, the swan-like pintail, the golden-eyes with their whistling wings; and the widgeon, the spoonbill, the gadwall, and the green-winged teal from the north, and now and then the wood ducks, who cry plaintively as they fly, as becomes a species that faces extinction.

These are ducks, most of them, that prefer the deep, open water, where they can breast the waves and dive for their food—no dabblers in mud puddles are they! But the hunter gives them a passing glance. He is waiting for the return of the mallards.

Before noon they start to come in. With quivering lips the hunter uses his call, and he crouches low in the protection of the rice that is piled over

(Concluded on page 24)

Live ducks settling among decoys.

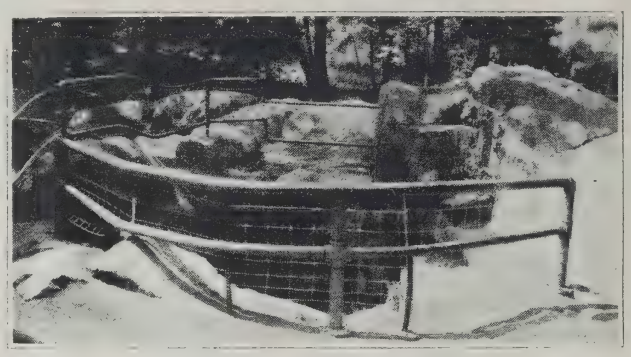
# Uncovering Millstones of the Gods

## The Wonders of Nature on the St. Croix River, Northern Minnesota

By FRED L. HOLMES

NATURE has worked great wonders through the ages. Deep gorges have been cut by the rushing waters of rivers. Caverns have been fashioned into fairy palaces, with beautiful stalactites hanging from the ceiling, through the incessant dripping of waters on soft sandstones. Rocky ledges have been polished by the grinding of glaciers. Climate, wind, and water have transformed Earth's ugliness into Nature's beauty. Fantastic are some of the results wrought through the workings of mundane laws.

At the upper end of the Mississippi Valley will be found the millstones of the gods. This great grinding machinery of nature fashioned by the power of glaciers is as fascinating in its boldness as the Garden of the Gods at the foot of Pike's Peak is wonderful in its immensity.



Excavations made in recent months on the Minnesota side at the dalles of the St. Croix River in Interstate Park disclose the largest glacial potholes in America. These great cistern holes have been bored in solid Keweenawan trap rock by whirlpools of some ancient mighty river which swirled and rotated the rocks like a grinding millstone. This action took place some time following the glacial period. While the presence of these enormous potholes have been known for many years, the depth of them was only recently ascertained.

On the edge of one of these enormous holes, bored out of a seamless rock, as if done by some giant carpenter's auger, the following sign has been posted:

GLACIAL KETTLE

"So far as is known this is the largest and deepest glacial kettle in America. It has been bored in solid rock by the action of a mighty river grinding a hard granite rock against the softer trap rock for many ages.

"This kettle is 12 feet in diameter at the mouth. At a depth of forty-two feet it is fifteen feet in diameter. At its base, which is sixty-three feet from its mouth, the diameter is three feet. The base of this kettle is twenty-five feet below the level of the St. Croix River, which is only a few rods away."

Zoological garden made from natural rock.

The rock ledges at the dalles of the St. Croix River, north of Minneapolis, are ancient lava flows, according to Professor Lawrence Martin, recently of the geology department of the University of Wisconsin. The lava or trap is well jointed so that there are vertical precipices and isolated crags along the St. Croix River.

Scenes along the dalles of the St. Croix River in Northern Minnesota.

The dalles of the St. Croix are a primer lesson in geology. Here has been legibly left the record of the glaciers when America was in its making.

The interpretations of the scientist or geologist are not required. The evidence is apparent to the most casual eye. At once there is disclosed to the visitor one of the chiefest secrets of nature. It is a story of the power of rushing waters, which can only be realized by those who have seen modern engineers harness and put to the work of mankind this same force of water powers.

As explained by the geologists, after this flow of lava rock had formed in this vicinity, a glacier nosed its way down from the north dragging with it large deposits of granite rock. When the glacier melted, mighty rivers were formed, which carried the granite boulders along in its course until they were snagged in some crevice of the softer trap-rock formations. So powerful was the river at places that whirlpools were formed, which rotated the granite rocks, cutting deep potholes into the softer material.

The debris from these potholes show great granite boulders which have been whirled in the basin so long that they have become spherical, like a ball. Some of these granite boulders are three or four feet in diameter and there are literally thousands of smaller pebbles that can be held in the hand. The grist and sand of the potholes show that the loose gravel and earth have been produced by this mighty grinding process. It was a millstone which only the gods could operate.

There are probably forty potholes, large and small, within the confines of the park area. Some of them are two or three feet in diameter and only a few feet deep. Others are ten and twelve feet in diameter. Only three or four of these potholes have been excavated.

When it became known that these investigations and excavations were under way, the stream of visitors to the park increased. On one day 10,000 persons visited the scene and the park superintendent reports that 18,000 persons visited the Interstate Park within the first ten days of one month. (Concluded on page 29)

# A New Great Lake to Save Lakes

## Canadian Engineer Plans to Divert Albany River to Make Up Shortage

By WALLACE J. LAUT

IT IS possible that Far Northern Patricia Land in the province of Ontario holds the solution of whatever disadvantage looms before the midcontinental section of America as a result of the lowering in the levels of the Great Lakes.

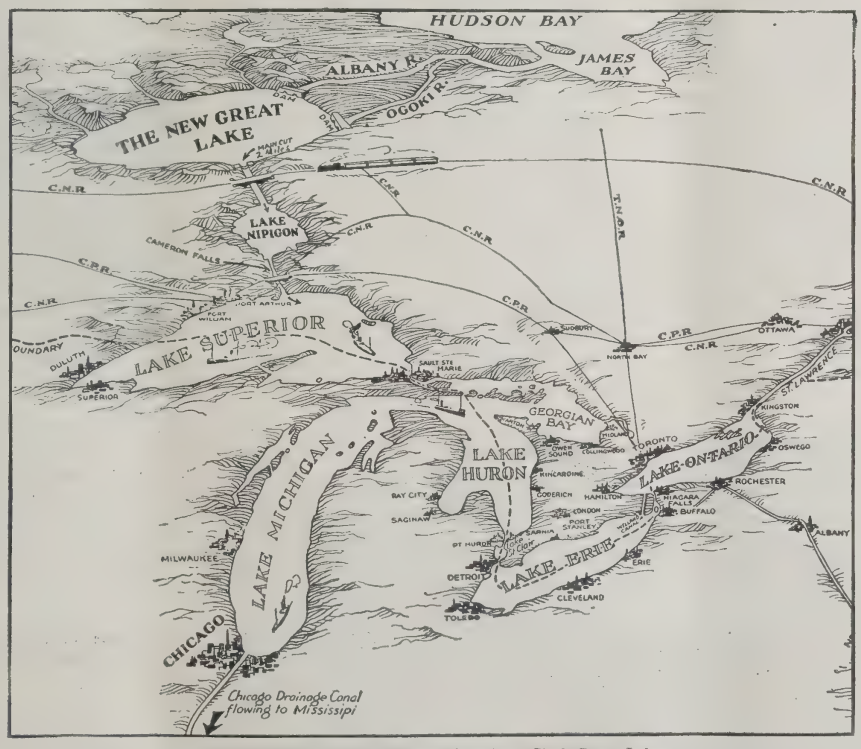
It is possible that one great diversion of lake water through the Chicago Drainage Canal may be offset by another diversion of a large volume of water that now flows uselessly and purposelessly to the Arctic Ocean from the wilds of the Canadian North.

A Canadian engineer who has traversed this little-known northern area by canoe and trail may hold the key to the restoration of Great Lakes levels with consequences that may be totaled up only in terms of millions, whether people, dollars, pounds of lake freight or electrical horsepower are considered.

Lorne Campbell, of Toronto, the engineer to whom reference is made, has just returned from the latest of his five-year explorations of the Patricia area, and with his conviction doubly strengthened that a sixth Great Lake may be added to the present chain and a volume of water added to the Great Lakes sufficient to restore normal levels and at the same time provide the city of Chicago with an ample supply of water for drainage purposes. If this project be feasible, and many declare that Nature has worked with man to make it entirely possible, the resultant benefits, even on a superficial survey, would be staggering in the bearing they have on many important phases of existence to the 40,000,000 dwellers in the area contiguous to and affected by the Great Lakes chain.

The writer has had the privilege for some months of discussing with Mr. Campbell his plan for the saving of the Great Lakes. Early in the summer this Canadian engineer departed from Toronto and made for the North. He has made many surveys of the area, and this year's trip took him over more than 900 miles of the waterways of Patricia, over scores of portages, through avenues that have been trod rarely if ever before by the white man, and to all the important points which have a bearing on the project to which he has devoted himself since first he prospected the district.

It was along the Albany River and its many tributaries that this summer's route was scheduled. The Albany is the largest river that flows exclusively in the province of Ontario. It has been called "the St. Lawrence of the North," and it divides Thunder Bay district from Patricia. Flowing northeast into James Bay, the lower section of Hudson Bay, it carries an enormous volume of water into the bracken waters of the Arctic, there to flow through Hudson Straits and out to the North Atlantic.



The Albany is a stream of rapid fall and swift current. Mr. Campbell tells of making seventy miles between 9:30 a.m. and 5:30 p.m. because the canoe in which he and his companions were traveling was literally hurled along the racing stream. And this is easily understood when it is known that behind the Albany lie hundreds of lakes and streams which feed a mighty river, draining thousands of square miles, and carrying their waters north to the region of icebergs and polar bears.

The Albany basin lies between two heights of land running east and west. These natural divides converge at the eastern and the western ends, and the Albany is the neck of the bottle through which the waters make egress.

Stop the flow of the Albany River at the most strategic location by means of a great dam. Build another dam across the Ogoki, a principal tributary of the Albany, and you have created an enormous basin or artificial lake twice the size of Lake Ontario. The flow of the Albany to the Arctic is checked and the water is stored for the use of mankind.

Then to turn this volume of water into the Great Lakes. This may be accomplished, according to Mr. Campbell, by cutting through the lower height of land for a distance of less than a mile, and sending the water from the new Great Lake into Lake Nipigon and through the Nipigon River into Lake Superior.

This is the crux of the project, in simplified terms so that any one with a school map of Ontario before him may grasp its essentials. It cannot, of course, be so easily simplified in terms of engineering, yet the father of the plan is satisfied that it is not a matter of engineering intricacies nor technicalities that confront him, so much as the necessity for detailing the work in such a large area. It is apparent that the basin for the new lake already (Continued on page 26)

Bird's-eye Map Showing Plan for Creating a Sixth Great Lake.
Two dams will form in the natural basin of the Albany River a new lake, two and a half times as large as Lake Ontario. A canal less than two miles long will carry the water from this lake into Lake Nipigon, through the Nipigon River and into Lake Superior, thus providing for the Great Lakes a flow almost twice as great as the volume diverted from Lake Michigan by the city of Chicago.

# Sam Slick's Journeys through Nova Scotia

## The Connecticut Clockmaker Discourses on the "Bluenoses"

EVERY year hundreds of American tourists go over to Scotland to make the journey through the Trossachs with Scott's *Lady of the Lake* as a guide.

I am moved to wonder whether a journey to the land of Nova Scotia with Sam Slick, the clockmaker from Slickville, Onion County, Connecticut, wouldn't be a trifle more rewarding for many of us, as either an actual journey or an armchair one.

Nova Scotia is every whit as beautiful as the Trossachs region of Scotland. It is such a country as Greece, the ocean and the mountains never far apart. "A land of rivers, valleys, murmuring brooks, widespread alluvial meadows covered with grazing herds, sheltered and placid lakes, rugged cliffs and bold promontories that invade the sea or resist its assaults." The springs, summers, and winters are much as they are in the Trossachs, but the autumn is incomparably finer. The most experienced travelers have declared that there is nothing like it in the Old World, except in Korea and Japan, in the gorgeous riot of color that prevails, which is, for all its exuberance, as harmonious as an old oriental rug or shawl. The weather, Sam Slick says, is "'like a mint julip with a lump of ice in it, it tastes cool and feels warm.'"

The guide whom I propose, Sam Slick, the hero of Judge Haliburton's *Clockmaker* is worth knowing, worth having for a traveling companion for at least two reasons: he is, first of all, no stranger to any of us, but is the very person we have come to feel some affection for as "Uncle Sam," and as a second reason his talk is natural, easy, comfortable, amusing and wise.

If you are willing to consider this journey it will be best for you to begin by pursuing the same course as do the visitors to the Trossachs; they learn something of the actual history of the country (then swamp the truth under poetry), in this case what you learn you may retain. Sam knows all that very well, though he has not learned it from books, for which he has no respect—"'they weaken your understandin' as water does brandy.'"

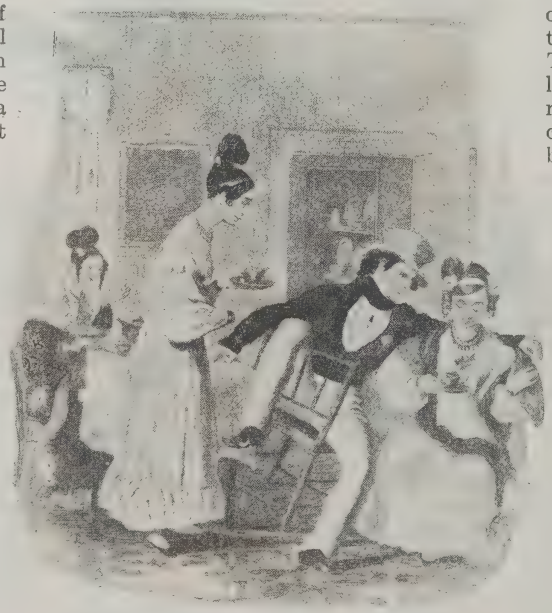
First, of course, the Indians held the country, the Micmacs, a branch of the great Algonquin family.

"Their names of music linger
On each bay and mount and stream."

They also gave the country its earliest name, Acadie, which it still retains in poetry; it means, simply, *place*. In 1497 John Cabot landed at Prima Vista and announced the fact to the English under whose flag he sailed.

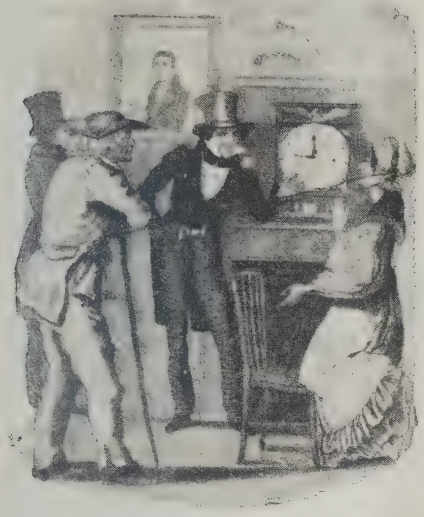
In 1604 the French king, Henry the Fourth, became of the opinion that he owned the land, and gave a colonization charter for it to Sieur de Monts, who at once took French peasants out to it and began the settling of the land. With no help whatever from the French Government, during the course of a century, a very beautiful civilization was built up on the west coast of what was then known as Acadie. You can read a truthful account of it in Judge Thomas Haliburton's *History of Nova Scotia*, the same Judge Haliburton who is also the creator of our future guide, Sam Slick. You need have no fear of prejudice or propaganda, for although the judge belonged to the usurping race and was a beneficiary of the ruin of the people whose story he tells, the truth is related about the people who were most disgracefully dispossessed in favor of his grandfather.

If you prefer the story told, just as truthfully, in poetry, you can have it so in the *Evangeline* of Longfellow.



Both will tell of French peasants going briskly and happily to work to create a new and better Normandy in the primeval forests. They fell trees, till land for flax and wheat and vegetables, build great successful dykes against the tide at the Basin of Minas which rises to sixty feet in height; they build them so that at stated seasons the floodgates can be opened and the land drenched in the revivifying water, they erect staunch houses.

" . . . . of oak and hemlock
Such as the peasants of Normandie
built in the reign of the Henries.
Thatched were the roofs, with dormer
windows, and gables projecting."



Men and women work unitedly, there is contentment and simplicity and unfretting labor, friendship with the Indians, an absence of artificial prosperity, boosterdom and supersalesmanship,

"There the richest were poor and the
poorest lived in abundance."

While this fraternity of laborers is constructively busy on the shores of the Basin of Minas an ominous thing is transpiring in England. There, an ambitious and more or less four-flushing sort of courtier, named Sir William Alexander, becomes enamored of the notion of being styled "Lord Paramount" of something or other and hits upon this land of Acadie. It is understood to belong, by right of colonization, to the French friends and supporters of Sir William's liege lord, James the First, King of England. However, whatever gratitude there should have existed in the mind or heart of King James toward the French did not deter him from making out a charter to the land and handing it over to Sir William. Sir William thereupon suggested that the name of the country had best be changed to Nova Scotia; it will be necessary to induce people to go out to populate it and make it profitable territory for the

All in the interest of future business.

Sam sells a seven-dollar clock for forty dollars to folks who don't need one.

king and also for himself its "Lord Paramount," and that name should appeal to Scotsmen, so that whatever idea some of them may have of emigrating to Virginia or Massachusetts will be changed in favor of going out to Nova Scotia. The obliging king changed the name. Sir William sent his son and a group of colonists over to his new domain, they landed, perceived that Sir William had painted conditions too glowingly and returned.

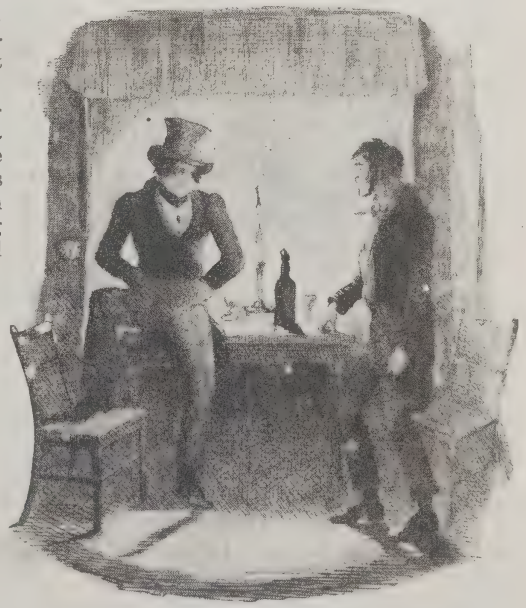
The charter, however, remained valid, and the English kings and their representatives maintained that King James having said that the land of Acadie was English, English it was. Finally in 1713 the French agreed with them and left the French colonists to whatever fate might be in store for them at English hands.

In 1740 England began serious colonization of Nova Scotia by sending between two and three thousand persons out to build up a town at the harbor of Halifax. They were retired military and naval officers, soldiers, sailors, gentlemen, some mechanics, a few farmers and some useful and industrious Swiss. These people came, most of them, with a strong sense of their importance to England and an absence of any desire to work. For three years England supplied all their wants. She had at the outset given them huge grants of land. Then she summarily ceased the pampering and left the Halifaxians to manage for themselves. They did it with no enthusiasm and spent a generous amount of time concocting schemes for securing government bounties and casting covetous eyes at the prosperity of the French colonists.

In 1753 Lunenburg was settled by Germans whom England brought over. They proved excellent colonists.

In 1755 occurred the expulsion of our friends the French Acadians. The credit for the deed belongs to Governor Shirley, of Massachusetts, and the Massachusetts colonists. England's part in it was only that of finally yielding to their representations of the disloyalty of the French. And so these good French peasants who had made that country a garden spot were torn from all that they had labored for, ruthlessly thrust into ships, manned chiefly by Massachusetts colonists, and scattered on the earth's surface to make shift as they might.

The lands, the houses, the barns, everything, was given shortly afterward to immigrants from Massachusetts and to some of the covetous Halifaxians.



In another few years, Massachusetts had started a war on this good-natured Mother Country of hers and the thirteen colonies had set up a government of their own. Thousands of the colonists had fought on the side of the English Government; they now found their possessions confiscated and themselves in no favor. England came to their aid. She established them in her other colonial possessions. Twenty thousand of them came to Nova Scotia; they were given large grants of land, annuities, offices, half-pay allowances to officers, and there was a general disbursement of sixteen million dollars, of which they received a share. Supplies and the necessaries of life were granted for three years. The Loyalists came principally to two sections of Nova Scotia, to the old Acadian valley where the land was in a fine state of cultivation, and where they expected a warm welcome from the former Massachusetts colonists and a ready ear and sympathy for the tales of their own heroism. The record, however, states that for the most part all that they encountered was jealousy and coldness and a very minimum of interest in their prowess in behalf of the Mother Country. So, bickering and bitterness prevailed in the erstwhile quiet vale of the French peasants.

The second division of Loyalists who came to Nova Scotia did as inexplicable a thing as the ancient builders on Shinar's plain. They built a city, which they named Shelburne, as big as the combined Montreal and Quebec of the time in the midst of a totally unproductive country, without making an effort toward creating its productivity, far even from supplies of fish for the catching. They built it rapidly, lived gay, social lives, until the three years had expired and all supplies from England ceased. There was consternation and wrath, and a dispersal of the population. Some remained to die of want. When Sam Slick made his tour of the peninsula with the squire the town stood there with no inhabitants, proof that fortune can't forever favor fools.

In the meantime good Scotch and Irish workers settled on the east coast where the soil is fertile, where there is lumber to cut and to sell and fish to catch and, likewise, to sell in great abundance.

That is the history of the country of Nova Scotia. As you think it over you find that you have a fertile country. "A splendid country, squire, that's a fact; the Lord never made the best of it. I wouldn't ax no better location in the farmin' line than any of these allotments; grand grazin' grounds and superfine tillagelands. A man that knowed what he was about might live like a fightin' cock here, and no great scratchin' for it, neither." It has been settled in the course of a century by a government that desired it settled for the purposes of empire. It had placed there groups of Germans and Swiss, had encouraged Scotch and Irish, had expelled, at the insistence of the colonists of Massachusetts, the French group which had been there longest and had property that was worth coveting, but later permitted a remnant of these expatriated people to return to the country, but not to their original district. They made a settlement in the township of Clare, which "still gives illustration of the thrift, industry, sobriety and piety of the descendants of the old proprieters of Acadie." These five groups looked after themselves as men are wont to do, became prosperous and influential. Four other groups were treated with staggering generosity, the English at Halifax, the English colonists from Massachusetts and the two divisions of Loyalists, those who settled on the west coast and builders of Shelburne.

Judge Haliburton is a descendant,

Sam and a specimen of shiftless, self-excusing idleness.

as you know, of one of the Massachusetts men to whom the Acadian possessions were given. He had been graduated at King's College Windsor, had practiced as a successful lawyer, had been a member of the national assembly, and, in 1835, was a judge. We like him as we look at him in his comfortable house among the trees in Windsor. He is no truckler, is able, shrewd, and at the same time a well-wisher to men. One evening, as he sat by his fire and over his wine, his mind ran upon the Yankee peddler who had appeared before him in court on that day. The man had interested him and he found himself wondering what that peddler of wooden clocks would say about the Nova Scotians, on a morning's ride, to such a person as himself. A conversation grew in his mind. Presently he lighted a candle and began to write it down. As he wrote his interest in it grew. The next day he sent what he had written, anonymously, to the local weekly newspaper, *The Nova Scotian*. It was published, read, talked about everywhere in blacksmith's shop and court room. After that, on leisurely evenings, the judge continued his account of the conversations and the journey on which they were conducted.

***Something About the Birth of a Classic***

In this way a classic came into existence, which, like most classics in these latter days, is not frequently read. Yet it is full of life and fun and its hero is one of the best-known figures in the world.

The journey starts in the north of the peninsula at Colchester near Fort Lawrence in the midst of rich scenery, and the theme of the book is at once broached:

> "What a pity it is, Mr. Slick," said the squire, "that you, who are so successful in teaching these people the value of clocks, could not also teach them the value of time."
>
> "I guess," said he, "they have got that ring to grow on their horns yet which every four-year-old has in our country."

In the guise of a humorous book the book is a diatribe on laziness, on wanting bounties from the government, on not valuing time, on expecting prosperity through anything but work and thrift.

***Judge and Peddler Talk About Ploughs and People***

The journey is made in Sam's wagon, behind Old Clay,

> "the prettiest piece of flesh and bone ever bound up in horsehide. What an eye he has, you might hang your hat on it! And then his nostrils, Lord they open up like the mouth of a speakin' trumpet. He can pick up miles and throw 'em behind him faster than a steam doctor a-racin' off with another man's wife."

You will drive over good roads and bad, through beautiful country, badly tilled, stop under sheds while it rains and Sam talks.

> "Now the Bluenoses are all stirrin' in winter. The young folks drive out the gals and talk love and all sorts of things as sweet as doughnuts. The old folks find it near about as well to leave the old woman at home for fear they shouldn't keep tune together; so they drive out alone to chat about House of Assembly with their neighbors while the boys and hired help do the chores. When the spring comes and the fields are dry enough to be sowed they all have to be ploughed, 'cause fall rains wash the land too much for fall ploughin'."

Well the ploughs have to be mended and sharpened 'cause " 'what's the use of doin' that afore it's wanted.' " Well the wheat gets in too late and then comes rust; but whose fault is that? Why the climate, to be sure, for " 'Nova Scotia ain't a bread country.' "

Now how the Bluenoses can complain of their country when it's only one-third work and two-thirds " 'blowin' time' " no soul can tell.

> "Father used to say, when I lived on the farm along with him, 'Sam,' sais he, 'I vow I wish there was just four hundred days in the year, for its a plaguy sight too short for me. I can find as much work as all hands on us can do for 365 days and just thirty-five days more if we had'em. We ha'nt got a minit to spare; you must shell the corn and winner the grain at night and clean up all slick, or I guess we'll fall astern as sure as the Lord made Moses.' If he didn't keep us all at it, a-drivin' away full chisel the whole blessed time it's a pity. There was no 'blowin' time' there you may depend. We ploughed all fall for dear life. In winter we thrashed, made and mended tools, went to market and mill, and cut our fire wood and rails. As soon as the frost was gone came sowin' and plantin' and weedin' and hoin', then harvest and spreadin' compost, then gatherin' manure, fencin' and ditchin' and then turn to and fall plowin' agin. It all went around like a wheel without spokes. Instead of racin' over the country like a young doctor to show how busy a man is that has nothing to do as Bluenose does, and take a 'blowin' time' we kept a rail travelin' gate, an eight-mile-an-hour pace the whole year round."

***What the Pioneers Had to Contend With***

Sam doesn't omit to sell his clocks as we travel and we have an opportunity to be an eyewitness of the cleverest salesmanship that was ever depicted in any book, certainly as interesting and important a proceeding as watching the characters in the *Lady of the Lake* carry on a duelling match. Everywhere incidents occur or sights are seen which teach a moral or adorn a tale for Sam:

> "Agriculture is not only neglected but degraded here. Old Drivvle, down her to Maccan, said to me one day, 'for gracious sake,' sais he, 'Mr. Slick, do tell me what I shall do with Johnny. His mother sets great store by him and thinks he's the makin' of a considerable smart man.'
>
> " 'Well,' sais I, 'I'll tell you if you won't bee miffy with me.'
>
> " 'Miffy with you indeed,' said he, 'I guess I'll be very much obliged to you, such an understandin' man as you be.'
>
> " 'Well,' sais I, 'I'd take a stick and give him a rael good quiltin'. Jist tantune him like blazes and set him to work. What does the critter want? You have a good farm for him; let him go and airn his bread and when he can raise that, let him get a wife to make butter for it. And when he has more of both than he wants let him sell 'em and lay up his money; and he will soon have his bread buttered on both sides. Make a farmer of him and you will have the satisfaction of seein' him an honest, an independent, and a respectable member of society . . . more honest than traders, more independent than professional men and more respectable than either.' "

***Mr. Slick Tells What to Do With Johnny***

Very forthright language, you see.

And as we ride along through that country, the surge of the ocean in our ears, behind Old Clay going fourteen miles an hour, Sam will tell us many a good story of clock selling, and horse trading, and the ways of politicians and pious, hypocritical deacons, but never does he stray far from his theme.

***A Profitable Journey Comes to an End***

In this fashion, profitably and sensibly and amusingly the journey goes from Colchester to River Philip, Amherst, Windsor, Horton, Kentville, Yarmouth, Parrsboro, Shelburne, Liverpool, Lunenberg, Bridgetown, Annapolis Royal, Halifax and Bedford Basin.

After the journey has been made you may come home with your mind and body freshened from the contact with Sam Slick's ideas, and far better qualified than when you journeyed forth, to understand the causes for the present political and economic problems which Nova Scotia furnishes to Great Britain.

Ford

To accept Ford performance unquestioningly is a privilege that all Ford owners have long enjoyed.

But now, in addition to its known reliability, the Ford car offers new beauty of body design with increased comfort, convenience and utility.

People who could readily afford to pay more, are welcoming today's Ford with hearty enthusiasm. Its popularity is greater now than ever in the past among all classes.

When you see the smart looking cars now offered by all Authorized Ford Dealers, inspect the many new features which add the final touch to the enjoyment of Ford ownership.

# Puzzledom

## A Brief History of Word Jugglery From the Time of Solomon

By JOSEPH DANA MILLER

ONE of the fads of the younger generation, which is having extraordinary popularity, is the solving of "cross words." It provides a highly instructive pastime, and is adding enormously to the vocabulary of the student. It is not too much to say that it is widening the acquaintance of the younger generation, and indeed some of the older folk, with every department of knowledge, history, geography, biology, natural history, and so on.

How this diversion has grown in an amazingly short time is shown by the fact that a large volume has just been issued which aims to simplify and aid the work of solving these puzzles, giving many examples of the more intricate forms. More than fifty thousand copies of this book have been sold.

Many of the Sunday newspapers have introduced cross-word departments which recalls the times when many of them had puzzle columns. For this is but a phase, and in some sense a revival of what was once an extraordinarily popular amusement, known and perpetuated to the present day under the name of Puzzledom.

For the institution still flourishes. It will surprise readers of THE DEARBORN INDEPENDENT to learn that there are several thousand persons in this country who find their principal diversion in puzzle making. They call themselves "puzzlers," though they protest at times against the name because of the triviality which in popular apprehension the word connotes.

The things they fashion—to use some of the names familiar to the cult—are square words, enigmas, acrostics, rhomboids, anagrams, cryptograms, diamonds, charades, and more rarely, rebusses, as well as many variations of these forms. Rebusses, usually pictures of objects which conceal a proverb or the name of something, are not so much in fashion as they once were. Votaries of what they term "the mystic art" write enigmas in verse forms, and no less a poet than Byron has set the example. The acrostic forms are many and varied and were once very popular. Perhaps the most amazingly ingenious creation of this kind is the well-known acrostic tribute to Frances Sargeant Osgood, by Edgar Allan Poe, in which poem the first letter of the first line is the first letter of her name, the second letter of the second line the second letter of the name, and so on in this order until the whole name is complete. The disciples of Puzzledom will have to travel far to catch up with a feat of this kind.

The puzzlers of the country are represented by an organization calling itself the National Puzzlers' League which was organized in 1883, with Correl Kendall, of Boston, its first president, and which has met semiannually in convention at some central city every year since that time, almost without interruption. They come from every section of the country. The members are better known to one another by their pen names than by their real names.

Many of these pen names are fantastic enough, and are adopted often because they involve some degree of word jugglery, like L. M. N. Terry, Arty Fishel, or Sir Loin, or some anagram of the name, like Phil Down, whose real name is Windolph. And all of them will contend, with some degree of heat if necessary, that the work in which they are engaged offers unequaled opportunities for a liberal education. Efforts have even been made by them to introduce some of its features into the curriculum of the classroom. They point to the many successful men who have graduated from the puzzle fraternity as testimony to the value of this really intensive training.

We may take the Square Word as an example of the mental labor required for the making of all but the simplest forms. In the work of their solution reference must be had to dictionaries, gazetteers, and encyclopedias. In this way an enormous mass of information is acquired. So general, almost universal, are the sources that must be hunted out, so great are the additions to one's vocabulary, that Puzzledom has been called, with pardonable exaggeration, "a training school for literary work."

We are to remember that the men of the most highly cultured period in the world's history—the ancient Athenians—were not above this kind of intellectual diversion. Plutarch tells us that they were fond of propounding and solving enigmas. Many of the examples that have come down to us are of extraordinary ingenuity.

But their origin is of even greater antiquity. The ancient Egyptians were fond of riddles. Solomon was given to propounding them, as in the famous, "Out of the eater came forth meat and out of the strong came forth sweetness." —*Judges 14.* Riddles were sometimes inscribed on tombstones and monuments. Even some of the parables of Jesus were cast in the form of enigmas. A *Book of Riddles* was published in 1575 and Shakespeare mentions it in the *Merry Wives of Windsor.*

The acrostic and the anagram were a favorite diversion of ancient and medieval scholars. The *Encyclopedia Britannica* speaks contemptuously of the achievements in this line, saying, "despite the amount of labor that has been spent (or misspent), the anagrams that display a felicitous perfection of 'applyable sence' are remarkably few." On the other hand, Voltaire speaks in high terms of some of the examples in anagrammatic composition. Many of them show remarkable cleverness, as Johnny the Bear for the famous physician, John Abernethy, and the more famous anagrams which make *Honor est a nilo* out of Horatio Nelson, *Homo*

*amor est* from Thomas More, and that which makes from the United States *In te Deus Stat.* The antigram, which is the reverse of the anagram, gives an opposite meaning from the word selected, as "real fun" from funeral and "untie" from unite.

Then there are rebusses, of which mention has been made, and which are referred to by Jonson and Shakespeare; and the Palindrome, of which we have many examples in Latin but few in English. The best of the latter is the answer put in the mouth of Napoleon to the question whether he could have conquered the allied armies, "Able was I ere I saw Elba."

The charade, which for a period provided a popular form of entertainment at young people's parties, is of much more recent origin. It was acted, not written. Later the forms of puzzle making gave opportunities for verse writing and the examples we have from American puzzlers evince rather clever workmanship. An ancient form of puzzle making is the cryptogram. Then there are infinite variations of the forms cited at which the devotees of the "art," for so they persist in calling it, work assiduously, developing each particular form to greater and greater perfection.

This pastime began early in America. *Poor Richard's Almanac* contained puzzles. *The Farmers' Almanac* printed a puzzle column. *Peter Parley's Magazine* and *Merry's Museum*, periodicals of wide circulation in their day, had puzzle departments. But it was not until 1867, when Oliver Optic (William T. Adams) published his *Boys and Girls*, afterward *Oliver Optic's Magazine*, that American puzzledom received its first real impetus. *Harpers' Round Table*, *Wide Awake*, *St. Nicholas* and *Youth's Companion* included puzzle departments as permanent features. Some of the daily papers followed suit, among them being the Newark *Advertiser*, the Philadelphia *Evening Telegraph* and the New York *Staats Zeitung*.

Then, for some unexplained reason, the general interest declined and puzzle departments, at least in publications of a general character, almost entirely disappeared. To take their place there arose a number of small puzzle papers. Some of these were even devoted to special forms of the puzzle art, one a monthly, which lasted for twelve numbers, being devoted solely to cryptograms. Mostly they appear to have been issued by boys or young men whom the duties of maturer years, and later attractions, seduced from this zealous pastime. The first distinctively puzzle paper was issued from Auburn, Maine, and edited by W. L. Small.

But interest was not allowed to die out. The National Puzzlers' League published an official organ monthly; it is a small but well-edited paper of sixteen pages. *The Enigma* is its name, and it has had an uninterrupted existence since 1883. It encourages correspondence between the members; it discusses notable productions in various puzzle forms, and keeps its readers acquainted with the development which it sees in the "mystic art."

It is of interest to know that the National Puzzlers' League owes its origin to James M. Beck, now Solicitor General of the United States, who, in 1876 (he being a boy of fifteen at the time and writing puzzles under the name of "Goggles"), called the first convention of puzzlers together in Philadelphia in July of that year. Young Beck was editing a little puzzle paper at the time known as the *Sphinx*. It is not of record that any second convention was held by this group, but in 1883 the Eastern Puzzlers' League, which later became the National Puzzlers' League, was convened, and so we can trace the first suggestion of its origin to the little gathering of seven years before.

At all events, some of those who were present at the convention called by young Beck were present in 1883, so the line of descent to the present is clear enough. The Mystic Sisterhood, an association of female disciples of puzzledom, was organized in 1890, and I believe still exists. The claim is made by *(Concluded on page 25)*

"The charade is acted, not written."

# Ralph Waldo Emerson—His Supreme Service

(*Continued from page 2*)

dox his sermons seemed unsanctified, but the young delighted in them. There are more, or were a while ago, than 171 manuscript sermons still extant. To the discerning he seemed an angel which had paused in its flight to fill an empty pulpit.

But an angel in any pulpit must either have his wings clipped so as not to brush about too much with them, or else fold them quite away and see them atrophy, or else use them to fly away. It was only a question of time till the angel would fly out again, the real question being when would he go, by the door or the window, and what would occasion his departure?

***Sometime the Angel Would Fly Away***

In Emerson's case it was the Lord's Supper and public pastoral prayer. He was quite willing to celebrate the Sacrament without the elements as a rite of commemoration, and provided he did not have to do it. This was asking too much, even of a free-minded church. When he proposed in addition to make a pastoral prayer only when he felt like it, his congregation reluctantly bade him farewell and the angel flew away.

I have put in a paragraph or two what covered five years in time and cost Emerson himself a searching of heart, part of which he probably told no one but a deal of which he did write at length to his friends and in his journals. It was no light thing to end seven generations of ministers and a harder thing still to carry the faith and passion in which any man begins to be a preacher into a vaster and freer region without losing the force of them or doubting the truth of them.

Meanwhile his wife died, being as yet hardly twenty years old. The mental and spiritual strain of leaving the ministry and the death of his wife joined to break down, for the time, his health and he had never been too strong. His wife left him an income of perhaps $1,200 a year, more then than now, and he used it for his first long visit to Europe. I do not find in the official biography any statement that his inheritance financed his European trip, but, curiously enough, I did find that statement the other day in Wilson's *New Life of Carlyle*. He left Boston on Christmas Day, 1832, in a 236-ton brig, and the rough, uncomfortable voyage, with a steady diet of pork and beans, seems to have been just what he needed to put him back upon his feet physically.

***What Carlyle Thought of Emerson***

He came up through Sicily and South Italy to Rome and across to Paris and up to London. He was more inclined to moralize than to describe; he could no more have been a conventional traveler than a conventional parson. We remember his stay in England chiefly for his visit to Carlyle. Thomas and Jane were at that time living in fine solitude at Craigenputtock and their meeting is an epoch in early nineteenth-century literature. What Emerson says of the Carlyles should be taken to correct Froude and also perhaps, a bit, to correct Jane. "I found the youth I sought in Scotland [the said youth being eight years older than Emerson himself] and good and wise and pleasant he seems to me, and his wife a most accomplished, agreeable woman. Truth and peace and faith dwell with them and beautify them. I never saw more amiableness than in his countenance."

According to Carlyle, Emerson drifted in as a wandering and beatific presence, and disappeared after the fashion of such presences. "We kept him one night and then he left us; I saw him go up the hill; I didn't go with him to see him descend; I preferred to watch him mount and vanish like an angel." Thereafter the two were lifelong friends and tireless correspondents, the better friends perhaps since the Atlantic separated them. Emerson says he was not much influenced by Carlyle, and he should know, though if his style in an earlier period does not reflect Carlyle then either higher criticism is a delusion or I am no higher critic. I suspect also that Emerson owed his interest in German to Carlyle, and I suspect Thomas did a good deal to touch him off, though he went off in another direction.

***The Honorable Office of Hog Reeve***

The last of 1833 he was back home, refused a call to a church in New Bedford, suffered the death of his brother Edward, the most brilliant of the Emerson group, was confirmed in the receipt of a modest income from his wife's estate, had begun to lecture and was engaged to be married again. He was drawn to Concord, the ancient seat of the Emersons, bought a house there in 1835, married a little later and was in full state to set up as a sage. The town voted him the honorable office of hog reeve, said office going by immemorial right to newly married men. I should qualify an earlier statement that Emerson had altogether stopped preaching. He supplied the pulpit of East Lexington pretty constantly for three years. He liked to preach if you would let him preach his own way, without prayer or sacrament —and doubtless needed the money.

It was also a time when a man might do something in lecturing and so Emerson lectured through the years on pretty much every conceivable thing from the oversoul to circles. His lectures were from time to time published; he wrote *Nature* and his fame began to spread abroad. The modest white house in Concord grew to be a kind of shrine toward which some early pilgrims found their way, the vanguard of a very great company.

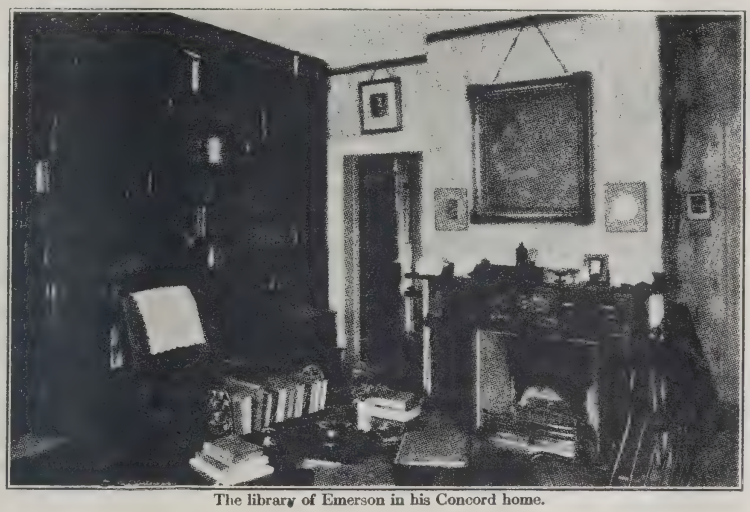
His period of greatest productivity was from 1835 to 1845. Angels might then be had for a modest honorarium. At his best he received $50 a lecture, in the country lyceums $10 and expenses, and meanwhile there were the butcher, the baker, the candlestickmaker, and the tax collector. If a literary gentleman does not complain about his finances, posterity may reasonably doubt his literary ability, and Emerson was no exception. But there was a shrewd strain in the man for all his transcendentalism, though he complained sadly at one time that his apple trees had brought him in more than his books; which might easily be so. The shrewdness kept him out of such experiments as Brook Farm and, in general, kept his feet rather close to the ground at a time when many other persons, being by no means so native to the higher regions as Emerson himself, made disastrous experiments in social and spiritual aviation. He visited England and Paris for the second time in 1847 and 1848. He found Thomas and Jane little changed for all the fourteen years which had passed, and living, according to his observation, on beautiful terms.

***Was Received as an Equal by the Great***

Emerson was, by this time, so much of a personage as to be received as an equal among equals by the great in literature and art both in England and in France, upon which experiences he meditates in true Emersonian fashion. He came back to an America across which the shadow of the anti-slavery conflict was beginning deeply to fall. He took the position of the more morally courageous of his time. He stood up for John Brown, which cost him much popularity as a lecturer, and wanted neither peace nor superficial union with the slave-holding powers. Something of the spirit of militant William I flamed up in him as the war came on, and going through the Charlestown navy yard he found the smell of gunpowder good. John Brown being now dead and more or less of a saint, the lyceum doors opened to him again and he did what he could during the Civil War to sustain and inspire the North.

***Harvard College Made Him an Overseer***

From 1864 to 1872 he lived in a kind of early Indian summer, much honored by his contemporaries and considered among many our most distinctive contribution to philosophy. He was one of the famous Saturday Club which gathered together at Young's Hotel



whatever was most brilliant in Boston, a club beloved of Holmes and Lowell and Motley. Harvard College made him an overseer and he should have had many happy years before him. But his house was burned in 1872, although his papers, doubtless including the 171 sermons, were saved. His friends joined in contributions of money which more than met his financial loss, but the shock disturbed a physical equilibrium not any too secure at its best, and those near to him detected a want of concentration and difficulty in a continuous effort of attention. They urged a European tour which was extended to include Egypt. He came home through London and there and in Oxford was the guest of many distinguished men.

Back in Concord once more he gathered his essays together for another volume, and was as much in demand for lectures and addresses as he had power to give. But there was a gradual failing of not so much the inner light as his connection with the things of earth. About this time Lowell heard him read a lecture of which he made sad business. He lost his place and turned his manuscript uncertainly, but kept his serene way for all that. "It was," says Lowell, "as if a visitor from some celestial region had lost his way in our earthly fogs and the blame for his wanderings was ours, not his." About this time, also, Reed Stuart, of Detroit, visited him and wandered with him through the woods about Walden Pond. At one point Emerson touched Stuart on the shoulder, stopped, pointed ahead, and said, "Hush!" "What did you see?" I once asked Stuart. "Nothing," he answered. But celestial visitants much lost in the mists of earth have their own vision.

His memory very greatly failed; he died in the spring of 1882 and was buried in Sleepy Hollow, a burial place which Emerson himself had consecrated in 1855 by delivering the address. He was buried under a tall pine tree not far from Hawthorne and Thoreau and the early Emersons. He has for a headstone a quartz boulder of irregular pyramidal shape which is rose-colored at the base and changes toward white at the top, as if to symbolize his own soul or else the flame of a genius which, though it was established in warm, human affection, was nevertheless in the high ascent of it pure and white and apparently untouched by the grosser conditions of the clay.

Emerson owed a great deal to the seven generations of Congregational and Unitarian ministers who fathered him body, mind and soul. They gave him a nervous organization, sensitive to beauty, easily played upon and particularly responsive to nature. They gave him a thoughtful, brooding mind, much given to introspection. He was what the psychologists nowadays would call an introvert. Whether they gave him logic or not depends on what you make of him. I don't think they did. They did give him great sense of ballance and proportion and great gifts of insight into the meanings and forces of life. They gave him elements of skepticism which they balanced with the great need for religion and faith.

Was he a popularizer of current sciences and philosophies? Literally, no, though he wrote and lectured a very great deal about science and was greatly influenced by its general contemporaneous currents. Does he write as a man in critical touch with any of the great philosophical systems? Hardly.

The library of Emerson in his Concord home.

Plato is always moving through his pages, but except for such references as any man might remember out of a classical course at college you could never tell what Platonism was from Emerson's writings. He was more influenced by Immanuel Kant and the transcendental German philosophers than any other single source, and yet there is next to no exposition of Kant in his passages—only a paragraph here and there.

Emerson was the first great American Idealist. But he was also a practical idealist. If the soul of a man because it is a manifestation of the universal spirit be the master force in a world whose firmament is starred with all the virtues, shall not a man do what he pleases with the world and make it clean and beautiful and bright and, above all, shall he not make himself gracious and fine and good? There was a shrewd strain in the man and he would help other men toward the art of living.

But he knew how to feather his arrows and could say a great thing in so plain a way that you can quote it as a proverb: "No change of circumstance can repair a defect of character"; "a friend is the hope of the heart"; "every ship is a romantic object except that we sail in"; "Of all debts men are least willing to pay taxes"; "The eyes of prudence will never shut"; "What you are speaks so loud I cannot hear what you say."

He did much in a practical way to give his countrymen a new spirit. The America of the first half of the nineteenth century was crude, conceited, bustling, grasping, ill-mannered, dreaming, materialistic, idealistic, intensely religious, narrow-minded religiously, on fire with a passion for education, and mostly half-educated or less. Such a spirit as Emerson's was an enormous corrective. I do not know what figure to use; it was not exactly as if a northwest wind blew into a fog—Emerson's influence was not clear-cut enough for that—nor was it as if a clear light shone into a murky region—his light had its own shadows.

I have said nothing at all of his literary style. The style is always the man and in Emerson the whole style is the whole man. He just missed being a great poet. He has a marvelous gift of poetic phrase, but not the gift of sustained song in rhyme or meter. But when you come to his prose, it is sustained music. He had a marvelous sense of the right word and the unusual adjective. His style is neither rhythmic nor balancedly metrical, as was Ruskin's at his best or the style of many lesser writers, for this is a trick anyone may manage if he tries. But there is almost always in an Emersonian passage one or two lines which sing themselves, and there is within all his prose a certain flowing quality.

We shall always be grateful for a man who writes like this:

This, he says, is the reward of the poet: "That the ideals shall be real to thee and the impressions of the actual world shall fall like summer rain, copious but not troublesome, to thine invulnerable essence. Thou shalt have the whole land for thy park and manor, the sea for thy bath and navigation, without tax and without envy; the woods and the rivers thou shalt own, and thou shalt possess that wherein others are only tenants and boarders. Thou true Land-lord! Sea-lord! Air-lord! Wherever snow falls or water flows or birds fly, wherever day and night meet in twilight, wherever the blue heaven is hung by cloud or sown with star, wherever are forms with transparent boundaries, wherever are

outlets into celestial space, wherever is danger and awe and love—there is beauty, plenteous as rain, shed for thee. And though thou shouldst walk the world over, thou shalt not be able to find a condition inopportune or ignoble."

If I should hear a passage like that spoken by a man with a musical voice and a gracious and shining presence, who bore himself as being a citizen of the land of which he spoke, though I should not clearly understand what he meant, I would know myself to have heard a noble and moving music sung by a singer whose own life revealed the harmonies out of which he sung, and having heard him I would go on my way, sensible of a region of truth and beauty of which I also should like to be a citizen, and more minded than ever to find some path of my own into that region. This, I repeat, to have been the supreme service of Emerson to his time and to his readers since, and by such a test as this President Eliot is right and he belongs to the first ten great influences of the last two thousand years.

## King of the Wild Rice Beds

(*Concluded from page 13*)

his boat. When once he drops a duck into the rice, he must never take his eyes from the spot where it hit the water, for a rice bed resembles a cornfield in that each part looks like another.

It's cold work, sometimes, this business of duck hunting. Ducks fly best when the wind is northerly, and the sleet or rain drifts with it. Water that is little less than ice covers the pole and manages to get splashed around over everything. Sleet that turns to snow drives into the faces of the hunters, and clings to the rice stalks, bending them low to the water and giving the boatman a chance to show his strength in pushing the sharp-nosed craft.

First of the ducks to take wing when the restless time of year comes around, the mallard is also the last to leave, finally, for the south. Many stay all winter in the clime of their birth, and there are few warm spring creeks that defy the cold that do not shield a company of mallards all winter.

Early to get excited about leaving for the south, flying in circles all autumn in blissful indecision, finally remaining far from balmy breezes all winter, the mallard and his tantalizing ways touch a responsive chord in the hearts of the hunters.

At any rate when ten million men take to the field in the autumn, in the hearts of most is etched a picture of ultimate hope—a picture of the mallard, His Majesty of the marshes.

# Is Coal Passing Out as a Fuel?

(*Concluded from page 4*)

water and, more important, of fuel oil, and also apparently a reduction of the rate of increase in the country's requirements for fuel and power."

In the later report it is shown that the call for more fuel and power is not being reduced. Even Federal experts could not believe that coal was on the decline without a parallel decline in demand for energy, until further studies convinced them. Today there is no longer any doubt about it. Beehive coking, wasting 33 per cent of the heat in the coal, is steadily being replaced by the by-product system, which recovers all but 10 per cent. In 1913, according to the same Federal experts, it took 2,433 pounds of coke to make a ton of pig iron. In 1922 the work was done with 2,176 pounds. Electric power concerns needed 3.2 pounds of coal for every kilowatt hour of energy in 1919, but by 1923 they could get the same energy out of 2.4 pounds—a reduction of 25 per cent. Since then improvements have been made even in these remarkable economies.

It is evident, however, that the real decrease in the consumption of coal comes by direct change from coal to oil-burning equipment. This is manifest in the railroads and in virtually every great industry. The visible evidence is available for anybody in every large city. Every skyscraper built today is equipped to burn oil as well as coal. Many are without coal equipment. A few years ago the sight of an oil tank wagon pouring its black, liquid fuel into a hole in the sidewalk before a large office building was enough to draw a curious crowd. Today it is no longer of interest. It has become too common.

The total anthracite tonnage thus displaced is not so large as that of soft coal. Anthracite has been the great home fuel. When oil burners were introduced a few years ago the mine operators and coal dealers made quick computations, and came to the conclusion that the cost of installation would be prohibitive. Five years ago leaders of the hard coal industry asserted that oil could never take the place of clean, hard coal.

Since then they have changed their minds. The last year has been marked by an intensive advertising campaign designed to offset the growth of oil for home heating purposes. It is estimated by one of the largest distributors of oil-burning equipment for the home that a quarter of a million installations have been made in this country, most of them designed to displace anthracite. In Philadelphia alone twenty-five dealers have orders totaling five thousand installations—enough to keep them busy for the next year.

At least fifty burners are now on the market. One of the latest is the output of the world's largest oil producer in combination with one of the country's largest engineering firms. According to experts in this field, any consumer using fifteen tons or more of coal in his home a year can make a definite saving by changing over to oil, even after including the cost of the new equipment. If the consumption of coal is only seven tons a year, many of the oil-burner equipment companies offer to show the consumer how he can at least break even by changing to oil. These figures take no account of the cost and discomfort of ash removal, and the labor of furnace tending, both of which are eliminated by oil.

If the figure admitted by anthracite operators of a five-million-ton loss caused by domestic oil burners alone for last year be correct, it is quite probable that the loss this year will double that figure. The trend away from hard coal in dwellings today is limited only by the capacity of the oil installation firms, and is encouraged by the very efforts of the operators to offset it. They could, of course, cut prices, but they have chosen instead to push buckwheat coal as the competitor of oil. A large percentage of the buckwheat is "washery coal," taken from culm banks which have been standing as long as fifty years. In the beginning this was good coal. The longer it stands, however, the less heating value it has. It is not in any way comparable with fresh-mined coal.

In all the Federal and industrial analyses of the situation the experts have carefully refrained from making the obvious price prediction. But if one thing is indicated it is that sharp and nation-wide reductions in coal prices must be made if the industry is to live.

## A World of Islands

PAGO PAGO, American Samoa, is on the island of Tutuila. Two islands of Western Samoa, under New Zealand administration, are greater in extent than Tutuila, but the native of Tutuila won't believe it. His island is 35 miles around the coast and is the biggest island of all! Of what use would it be to have it any larger, he inquires. New Zealanders who come up to Western Samoa admit that they come from islands, says the Samoan. Occasional Australians brag that their place is larger than New Zealand, but admit it is an island. The British, whether they be English, Scotch or Irish, admit they come from islands. They bar out the Japanese, whom they say live in islands far to the north. Of all people, only the American lays claim to coming from a place that is so big it isn't an island at all, but a continent. "Let him brag," says the Samoan to himself. "He can't fool me."

## "I Read *in the* Papers"—

***I read in the papers*** that the enormous increase in the consumption of milk and cream in the North Atlantic cities and in Florida has caused a new orientation of the dairy industry of Wisconsin. Vast plants have been established there to concentrate and condition milk and cream for shipment to New York, Philadelphia, Washington and Jacksonville in carload lots that are sent forward upon fast passenger train schedules. It is said that milk can be produced in Wisconsin in quantity much cheaper than in the traditional dairy regions of the East. Incidentally, Danish scientists, who have attacked milk problems because of that little nation's devotion to the dairy industry, are said to believe that it is not too much to expect that synthetic or artificial milk may be produced. It would seem as if the limit in the long-distance handling of milk was in sight. Synthethic milk would doubtless fit into the situation much as artificial silk has been joined to the old natural silk industry.

***I read in the papers*** that Admiral Shoemaker has urged upon the aircraft investigating committee that enlisted men be trained as flyers. This is common sense. It is hard to understand why we have persisted in restricting pilot training to men who are commissioned officers. France leads the world in aviation with two enlisted or "private" pilots for every officer pilot and Japan maintains the same ratio. England, in order to use enlisted men, is paying off many of her officer pilots, giving them bonuses of $10,000 and upward to quit. There is nothing about flying that should restrict the piloting of an airplane to a commissioned officer. Flying requires a certain coördination of physical and mental powers that can best be compared to a fine baseball or tennis player, and so-called "education" has nothing to do with primary qualification. Annapolis and West Point would have to be doubled in size to train officer pilots sufficient to go through the sifting process and leave enough to man our proposed aircraft defense establishment. Whenever any vocation or profession is restricted to a certain class or breed, stagnation ensues. We opine that less shoulder straps and social swank and more encouragement of fit candidates for flying would give us plenty of aviators at a reasonable cost.

***I read in the papers*** that President Coolidge went to the convention of the American Legion and made a speech about various things, among which was a statement that army and navy officers should keep their fingers out of public discussion of defense policies. The Legion cheered, and the next day indorsed the plan of Colonel Mitchell who came under the description of the kind of officer the President disapproved of, if ever a man did. Thus Mr. Coolidge learned that enthusiastic reception of a President does not mean indorsement of all he says.

Why should not army and navy officers discuss such matters? In the first place, they are citizens of the United States as vitally interested as any of us in the security of the country. In the second place, they know what they are talking about more than anyone else; national defense is their study and their business, they know the technical elements involved, they know the comparative situation in the world. Of course, if they are to be judged as mere saber-rattlers who for their personal glory would militarize the nation and for their own enjoyment make wars, the view would be somewhat different. I know a good many military men and some navy men, but I have yet to meet one who has any liking for war.

***I read in the papers*** none of the traditional uproar about the approval by the Secretary of Agriculture of the merger of a couple of big packing concerns. Formerly such an approval would have stirred national indignation and been very unfavorably interpreted. Part of the indifference is probably due to the public belief that a heavy meat diet is unnecessary.

# Puzzledom

(*Concluded from page 21*)

puzzlers that the number of persons interested grows from year to year, but this I am unable to verify.

On Labor Day of this year the League held its eighty-second semi-annual convention in Scranton, Pennsylvania. Here they gathered with the old enthusiasm; here they discussed matters of interest to the "mystics" whom the organization represents with all the solemnity that characterizes the more pretentious and graver conclaves. They would resent the criticism that there are so many more important questions calling for solution on which perhaps the happiness of the race depends that to pursue avocations of this kind is a waste of time. They would retort that as the chief object of puzzledom is education there can be no more important preparatory work for the solution of serious world problems than the training of the mind to think correctly, to combine, to analyze, while at the same time gaining a great variety of knowledge, much of which would otherwise remain permanently unrevealed. And as testimony to the esteem in which their pastime was once held they would point to many ancient and medieval, as well as modern, instances. I do not know how you would answer.

And if they added that their mystic fraternity led to a spiritual companionship with the illustrious of the earth, and challenged comparison with the many fraternal orders on the score of usefulness, real enjoyment, and an influence for intellectual betterment, I for one should remain silent.

"Riddles were sometimes inscribed on tombstones and monuments."

# A New Great Lake to Save Lakes

(*Continued from page 15*)

exists between the heights of land. The damming of the two principal outlets will cause the waters to rise and flood the land, and the lake will be formed. There will be some embankments to be built up along certain stretches, but Mr. Campbell is certain that there is little low land, and that drag-line operations will provide for any "fills" that may be required.

The flooding of the area is one of the questions that arises when the plan is discussed in Ontario, but as this article proceeds the apparent disadvantages will be seen to be overbalanced by the immeasurable benefits that would accrue to the Great Lakes section, and more particularly to Ontario, in the event that the plan could be brought to the climax of organization and execution.

Today the city of Chicago is diverting through its drainage canal at the southerly tip of Lake Michigan an amount of water estimated to be the equivalent of a river one-third the size of the Mississippi River where it passes St. Louis. The recent War Department decision, which "saved the bacon" of Chicago after the Supreme Court had disallowed the diversion, permits the western metropolis to take from Lake Michigan 8,500 cubic feet of water a second, with a special provision that "at times" as much as 10,000 cubic feet a second may be taken. This water flows into the Mississippi.

This year the effect of this diversion of water has become manifest in a great many ways. It has been stated by reliable authorities that the Chicago diversion is now affecting transportation clear to the mouth of the St. Lawrence River, and the stranding of two ocean liners on their way to Montreal bears witness to the claim.

***Ocean Carriers Could Come to Lake Ports***

Lake navigation today is only 75 per cent efficient, because of the fact that vessels loaded to full capacity scrape bottom in almost every lake harbor and channel. Plans for the expenditure of millions are now being forced upon various communities and an enormous amount is being spent to keep the avenues of these great inland seas open for safe navigation.

The Campbell plan for the restoration of lake levels contemplates the bringing into the lakes of a volume of water sufficient to make unnecessary further harbor expenditure, and the canceling of large annual grants now devoted by the federal governments to keeping open the way for navigation.

The developments of hydroelectric power at Niagara Falls and other present and projected sites each would receive from the additional water supplied from the "Sixth Great Lake" at least 500,000 horsepower, and this benefit in itself, it is contended, would well reward the province of Ontario for the area required for flooding.

The hastening of the day of deep waterways is another obvious boon that would follow the raising of lake levels. Many harbors now unable to accommodate ocean ships would be well able to bid welcome these Atlantic carriers could the cities of the lakes put a foot or two more water in their portways.

In these advantages all would share, and the province of Ontario at the same time would be opening up an enormous new empire of timber and mineral lands which otherwise would be inaccessible for generations.

***Engineer Says Plan Is "Entirely Feasible"***

"Perhaps the project is too big to be grasped without considerable investigation," said Mr. Campbell, "but I am bold enough to state after careful research on the ground and over the streams concerned that it is entirely workable and feasible. First of all one should have a map of the area before him, to get an idea of the lay of the land and the waterways. Then the conviction will grip one, as it has me, that the connecting up of the waterways in question is entirely within the bounds of engineering achievement, and at relatively low cost.

"My journeys into the Patricia district commenced about five years ago, and have been continued at intervals ever since. It is a country with a closed door unless one knows the Indians and the factors of the few Hudson Bay posts. The only mode of travel is by canoe, with many portages and as many rapids. But with the maps available and by actual experience one gets the topography of the country and the volume and flow of the waters fixed in his mind.

"I found a great part of the country to be muskeg and rock, with large areas of timber. The timber is not now patrolled, and much of it will be burned unless some plan is devised to harvest it. None of the land is fit for agriculture, although there are large deposits of iron, which would stand high above any artificial lake.

"The country is threaded by an amazing number of streams and dotted with lake systems. The drainage is through the great Albany River to James Bay, and includes all of the water between these two heights of land, or an area of approximately 20,000 square miles.

"Long before the idea of coupling this water system with the Great Lakes came, it always struck me how purposeless and how useless was the flow of this great volume of fresh water into the salt waters of Hudson Bay. It could never affect the navigation of the Arctic, and it would be an immeasurable boon to both countries could it be turned to the use of the navigatory, power and drainage interests of the Great Lakes.

"My plan evolved gradually after I had given careful attention to the Patricia country as regards the possibility of a storage basin system. Then the conviction came home that it was entirely possible and wholly feasible to create a new great lake, a sixth member of the chain added to Lakes Superior, Michigan, Huron, Erie and Ontario. I am firmly convinced, though I reluctantly step into the limelight for the first time in my life, that the entire ineffective flow of the Albany Basin can be changed to an effective and beneficial flow into the Great Lakes.

"And Nature has done most of the work for us. She set down two great barriers running east and west and narrowed them down at both ends. At the eastern end of the basin the waters converge into the Albany as into the neck of a bottle. Plug the neck of the bottle with a dam and the waters are held back and spread over the area between the two heights of land. There you have the supply. The next step is to turn the water into the Great Lakes.

"It is remarkable to me that little more than a half-mile separates us from a portion of the Great Lakes system—Lake Nipigon and the Nipigon River—which drains into Lake Superior. On the map we can see how a cut or canal may be made through the lower height of land of the new lake and the water diverted into the Nipigon system down into Lake Superior.

***Flow Would Be Greater Than Chicago Takes***

The flow from this artificial lake would be far greater than the amount now diverted in an unnatural way by Chicago; there would be ample for Chicago, and in a few years the Great Lakes would be back to normal level.

"First you would have a new lake with an area of at least 15,000 square

---

Who has not read Hawthorne's *Scarlet Letter*? Very few, no doubt. But the great majority of people have never read how Hawthorne came to write it, and how he wrote it.

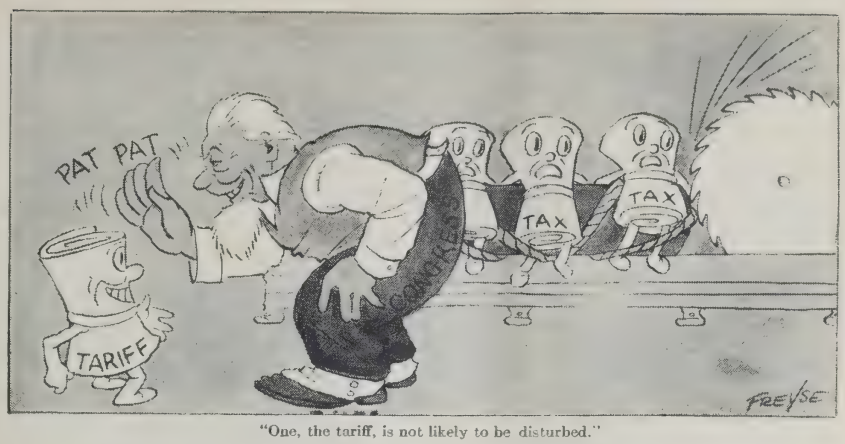
His son, Julian Hawthorne, who was a child then, knows the story of this great story well. He will tell it to the readers of THE DEARBORN INDEPENDENT in the next issue.

It is well worth the telling—and the reading.

miles, and a daily flow almost double the amount legally diverted by Chicago. Second, you would create a new carrying capacity for Great Lakes ships and automatically bring about a decrease in lake freight rates. Third, you would cut down or wipe out entirely the enormous annual outlay for the dredging of channels and harbors. The benefit to the entire fresh-water system would extend from Duluth clear to Quebec.

***Cost Less Than One-Third of Panama Canal***

"The fourth benefit is the enormous gain in water power. The available supply at Niagara Falls and other power sites would be increased by at least a half-million horsepower. The St. Lawrence power project would be made greater.



"The province of Ontario naturally and justly would receive the greatest benefit of all. In addition to the benefit to shipping in which she would share, she would have an immense amount of power added to her hydro-electric system. And the clearing of the timber from the area affected by the new lake would mean the employment of 20,000 men for from six to seven years. All the timber over the area would be cut and boomed before the water rose. Then it would be floated to pulp and paper mills, which would have to be built to accommodate it. There would be 8,000 square miles of timber to be cut, and in addition a large new area would be opened up along the shores of the new lake. This would mean the biggest industrial development in Ontario for many years, as the largest mills in the world would be required to handle the supply available after the land was cleared.

"I have made rough estimates showing that everything could be done for $150,000,000 to $200,000,000, or less than one-third the cost of the Panama Canal, even less, in fact, than some of the great irrigation schemes. This could be divided, as to annual charges, among the two federal governments and probably certain of the states and provinces."

***The Key to Restored Lake Levels***

And in conclusion Mr. Campbell, at whom the critics are sure to level their guns, and whom some politicians are almost certain to charge with representing some hidden, selfish interest, and at whom others are likely to send their supposedly all-damning denunciation of "Dreamer!" had this to say of the plan:

"My hope is that sufficient interest may be aroused in my proposal to bring about an investigation by an international commission appointed for the purpose by the two governments. My conviction is firm after a survey of many hundreds of miles that Northern Ontario holds the key to restored lake levels, the lifting of a great financial burden and a richer prosperity for the people of the two countries involved."

"One, the tariff, is not likely to be disturbed."

# Overflowing Streams of Taxes

(*Concluded from page 7*)

in demanding more than the things taxed are worth.

But the biggest controversy of all will be no doubt over the income taxes, but for which only a comparatively few people would know, except when buying a ticket at a more or less first-class theater, that Uncle Sam is a tax-gatherer.

The corporation income tax, being uniformly 12½ per cent, and thereby in essence an excise tax, isn't likely to be disturbed; for a lot of people still think that the corporations themselves bear the burden of it.

Then come the taxes on individual incomes. Something like 7,000,000 persons contribute to the revenues thus derived. But of the $704,000,000 thus collected on incomes for the year 1923—the last for which details are available—56,862 persons paid $424,-500,000, or 60 per cent. Moreover, more than half of all the revenues taken from both personal and corporate incomes came ostensibly from only four of the forty-eight states. The two illustrations give verity to the crux of the big issues as to tax reduction and revision. Shall the four states and the 56,862 individuals be "soaked" or the forty-four states and the millions of individuals who ostensibly pay little be "relieved"?

President Coolidge and his immediate advisers on questions of finance would give most relief to the apparent minority. They are for making the big slashes in the high surtaxes, now ranging to a maximum of 40 per cent of incomes of largest size. They would reduce the maximum surtax to 20 per cent, or less. A few leaders not of the Coolidge party complexion would go even further. Senator Oscar Underwood, of Alabama, for instance, would revert to the maximum, 13 per cent, set up in the first income tax law piloted through the House of Representatives by him in 1913. He, like President Coolidge and Secretary Mellon, believes that low rather than high surtaxes will achieve the maximum of "soaking." Among the manifold anomalies that may be drawn from data bearing on this intricate question is the following:

In 1916 when the highest rate of taxation on incomes was 15 per cent, the government collected $51,487,356 from persons with incomes of a million or over. In 1920, with a maximum rate of 75 per cent, the government collected from this same class of persons only $49,185,085. The answer?—Evasion! It should not be forgotten that while the big government pretends to "soak" them, it and all the lesser governments press upon the possessors of big incomes the tax-free security means of avoidance. And there are numerous other means, one of which is the passing on to the shoulders of others the burden of taxes ostensibly paid by a few.

The problem resolves itself into the age-old question of who pays the taxes — hose who get the receipts or those who buy or borrow of or sell tc those who get the receipts?

The old political economists, such as Adam Smith and Ricardo, were in agreement as to everybody paying the taxes no matter how imposed ostensibly. Modern ones disagree on the point. In a dingy office in the United States Treasury Building in Washington there sits daily a man who serves as the government's prophet as to taxes. He forecasts results and does it with surprising accuracy. He doesn't like to be quoted, but he says:

"Everybody pays the taxes. You pay them whenever you buy a loaf of bread or a house, or contract a loan or sell a product of your labor, and you thereby pay all kinds, no matter how they apparently may be imposed on others. You pay those the government gets and those other and often bigger ones which the government doesn't get.

"The only way to prevent taxes from being passed on to all, everybody, is to confiscate the thing taxed. And then you kill the goose that lays the golden eggs of taxation and, in the long run, only add to the common burden."

# Putting Muscle Shoals on the Map

## Some Say That the "Mussels" Found There Account for the Name

By LOUIS C. KARPINSKI

WHO put Muscle Shoals on the map? Why Muscle? And when was it named? And when did it appear upon the map? These are questions interesting to all the various parties who have a vital interest in this one of America's great natural resources.

Several learned articles have appeared recently in *Science*, organ of the American Association for the Advancement of Science, with reference to the name. Who put the Muscle in the Shoals? One answer would have it that the Indians found it took muscle to navigate the shoals with the canoe, and hence the name. Others would have it that there are so many varieties of mussels there that the Indians gave the name.

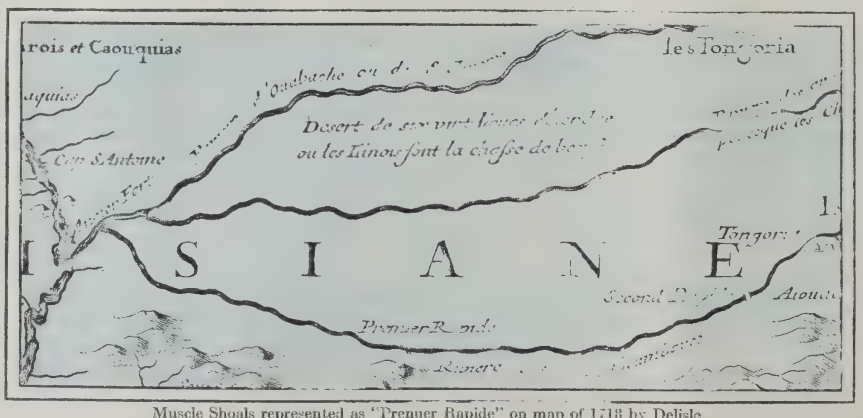
The earliest reference in these articles is to a work in 1832, with the name Muscle Shoals. The writer has found, however, that the name first appears upon an American map of 1789, as Muscle Shoals, and similarly upon several other American maps made before 1800. Muscle Shoals it was and so it should remain.

In 1784 Governor Alex Martin, of North Carolina, wrote to Governor Lyman Hall, of Georgia, about Spaniards settling on "Muscle Shoals on Tennessee . . . doubtful whether in North Carolina or Georgia." This is the earliest reference by name to the Shoals.

The first American geography appeared in 1789 at Elizabethtown, New Jersey, the work of Jedidiah Morse, father of Samuel B. Morse whose name is known in electrical circles. On the map of the southern portion of the United States made by Amos Doolittle in 1788 Muscle Shoals appears. The *American Gazeteer* by Morse appeared in 1797 at Boston. Jedidiah describes the Shoals as follows:

"Muscle Shoals, in Tennessee River, about 250 miles from its mouth, extend about 20 miles, and derive their name from the number of shell-fish found there. At this place the river spreads to the breadth of 3 miles, and forms a number of islands; and the passage is difficult, except when there is a swell in the river. From this place up to the Whirl, or Suck, where the river breaks through the Great Ridge, or Cumberland Mountain, is 250 miles, the navigation all the way excellent."

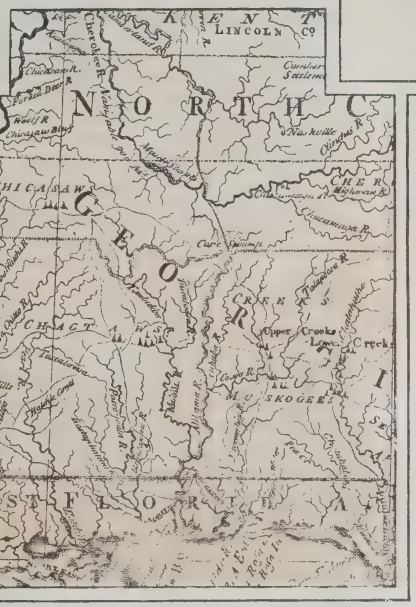
Map made in 1703, first to indicate Muscle Shoals (see arrow), by Delisle.



Joseph Scott in *The United States Gazeteer* of 1795, sometimes called the first American Atlas, as it has seventeen maps, mentions under the "Tennessee" River the islands of the Shoals and has the name Muscle-Shoals on the map of the S. W. Territory. John Reid's *Atlas*, published in New York in 1796, and Carey's *American Atlas* which appeared one year earlier at Philadelphia, both have "Muscle Shoals" so named on the maps of the region. These are the earliest American atlases.

The first edition of Worcester's *A Geographical Dictionary or Universal Gazeteer* (Andover, 1817) says that Muscle Shoals "receives its name from the number of soft shell turtles and fresh water clams found there."

Concerning the mussels in this region there can be no dispute. As early as 1834 Conrad in a work on Freshwater Shells of the United States mentions that the bivalves are especially common in Northern Alabama and Tennessee. Some eighty different varieties, belonging to 29 genera have been found in the region. In 1795 the spelling "muscle" was the common one, from the Latin "musculus." The great historical dictionaries do not give "mussel" as appearing before the nineteenth century, and even Browning refers to the muscle-shell in one of his poems.



The region attracted the attention of the French and English early in the eighteenth century. The shoals as a rapids appear upon a French map of 1718, by Delisle, as "Prenuer Rapide" and "Second Rapide" while the same author gave in 1703 a kind of little lake for this section of the river. A little later a kind of lake with numerous small islands is outlined. On an English map of 1720 by Henry Moll one of these islands bears the name Cusatees Island which name was also applied to the river.

In the year 1722 an Englishman, Daniel Coxe, wrote a description of this region, entitled *A Description of the English Province of Carolana, by the Spaniards call'd Florider and by the French La Louisiane.* In the text and on the map four islands appear, each being said to have been inhabited by "a Nation of Indians." The four islands were named Lahogale, Kakick, Cochaly and Taby. In 1775 the highly popular English atlas by Kitchin placed "A Fit Place for a Factory" at the "First Falls" on the Cherokee or Hogohegee River now called Hogehego or Kallamak River, and in 1794 included "Mialago or the Great Isle."

Muscle Shoals represented as "Prenuer Rapide" on map of 1718 by Delisle.

Left—Map of 1783 points out Muscle Shoals as "a fit place for a factory."

Center—Muscle Shoals shown on a map of 1789. Map by Sayer, in Morse's Geography.

Right—Muscle Shoals represented on map in John Reid's American Atlas of 1795.

The name of the Tennessee River in this region has been varied. The Indian name Tohogalegas or Thegalegos as well as Cusatees appears. The three names Hogohegee and Callamaco or Acanseasipi are all found on a map of 1733, and here one reads: "A fit place for an English Factory." At this time "factory" meant not a place of manufacturing, but a trading station. A "factor" was an agent who handled goods for sale. Another common name was the Cherakee River after the Indians of the region.

Muscle Shoals is so placed that the region has belonged at various times to Virginia, to Louisiana, to Florida, to North Carolina, to Georgia, and finally to Alabama. The region is covered by the original grant of Virginia to Raleigh; it lies in the Spanish region of Florida; it lies in the territory named Louisiana by La Salle and so appears upon many maps; after the English conquered the French in 1763 North Carolina was considered as extending west to the Mississippi River. In Colonial America Georgia included this part, and so it appears on early American maps after the Revolution. Indeed Muscle Shoals seems to fall within the state of Franklin or Frankland which enjoyed a hectic career from 1784 to 1787. Finally, however, Alabama became the proud possessor. Possibly no other region in the United States has enjoyed so many names and few regions have so greatly altered their topography.

In 1832 the nationalist Conrad wrote that "the lover of the grand and beautiful in natural scenery . . . will be delighted with a noble river whose beautiful and numerous islands are clothed with gigantic trees . . . whose high and undulating shore . . . is ornamented with thriving villages . . ." Gone are the islands, but the thriving villages bid fair to return and prove the shoals an ornament and a blessing to America.

# Uncovering Millstones of the Gods

(*Concluded from page 14*)

Interstate Park was founded a number of years ago through the joint actions of the Wisconsin and Minnesota legislatures. It contains 730 acres, of which 580 are owned by Wisconsin and 150 acres by Minnesota. On the Wisconsin side the city of St. Croix Falls is at the edge of the park lands, with the extensive Wisconsin State fish hatchery within the state park limits. The city of Taylor Falls is within the Minnesota park area.

Aside from the enormous potholes in the park, the dells of the St. Croix are the chief feature. The river here flows through a narrow gorge in the Keweenawan trap rock, which at one point rises to a height of more than 200 feet.

Recently the State of Wisconsin established a large trout fish hatchery at the edge of the park on one of the steep embankments overlooking the dalles area. Twoscore of fish-propagating basins are fed by the numerous natural artesian springs.

Picturesque rock formations mark the landscape. It seems as if the gods at work had shoved these mighty rock ledges into a heap and then deserted the place. Interesting names have been given to some of these rock formations. "The Old Man of the Dalles" is a remarkable profile face on the Wisconsin shore, and the "Devil's Chair" is a weird-looking column of rock on the Minnesota side. Down the river is a rocky escarpment called the "Savior's Cross."

Bold rock ledges mark the St. Croix dells area. The main street of the city of St. Croix Falls is on the next to the highest of these terraces. From that bridge crossing the St. Croix River, joining the two park areas and the two states, the river to the south flows turbulently through a narrow gorge. On the crests of some of these rocky escarpments, black oak trees are struggling, sending long roots down to the water side through crevices between the split-off rocks.

The wave-cut edges on these rocks show that in ages long ago, a river flowed mightier than now traverses the valley. Geologists claim that before the glacial period the St. Croix River probably lay to the west in the State of Minnesota and followed a different course all the way to the Mississippi.

In cutting a gorge through the rocks the high rock embankments stand out bold, like the "Navy Yards" in the dells of the Wisconsin at Kilbourn. Through narrow passageways the river becomes angry and troubled, flecking its surface with foam. Down a mile it again becomes calm and peaceful.

Within the park area is a large lake, formed by a bayou of the St. Croix River, one of the boundaries of the state. Down the sides of the steep cliffs pine, oak, elm, and silver maple trees abound with a heavy underbrush of blackberry.

From the lofty terraces on the Wisconsin side, looking into the amphitheater, with its river and dells, with two cities nestled on opposite banks of the stream, with wavy water-eaten lines in the rocky ledges, the work of the century seems infinitesimal compared with the time that nature has been fashioning in this wonderland of cliffs and rocky gorges.

The dalles of St. Croix Falls is the playground where the gods tested their feats of strength in rudely piling up the jagged ledges of rock for the wonder and awe of the ages of men to follow.

# Hitching Up to Alaska

(*Concluded from page 6*)

wireless station in the world that maintained regular communication over a distance of one hundred miles.

The difficult land lines were replaced by radio stations as soon as good apparatus was available, and the present telegraph lines are along good roads.

The population and commerce of Alaska center along the southeastern coast whose scenic grandeur and pleasant climate have made it a favorite objective of tourists from all over the world. It was at once seen that direct, cable communication between there and Seattle was essential.

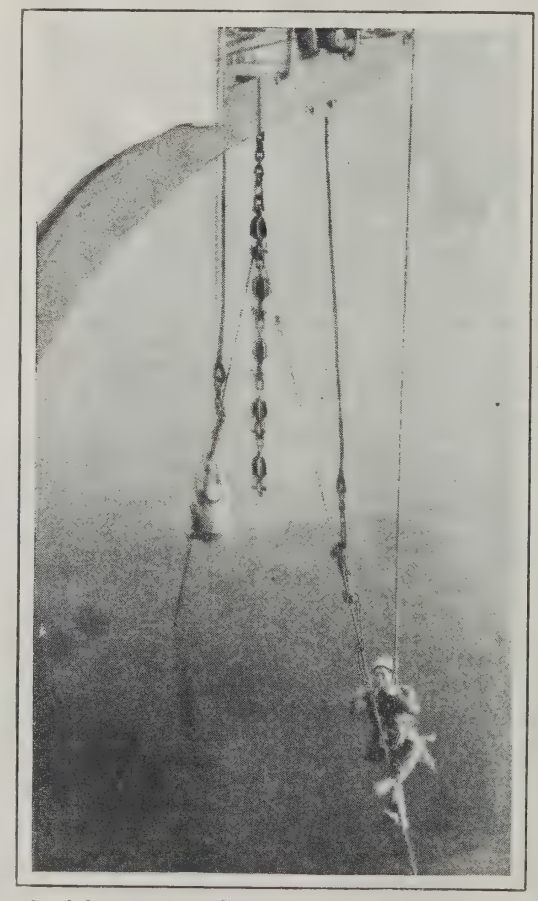
In 1905 the Signal Corps laid a cable between Seattle via Sitka and Juneau, where connection was made with the cable to Skagway and thence to line to Dawson. The following year the line was extended to Valdez, where direct connection was made with the Alaska land lines. Lack of money and time prevented the purchase of a regular gutta-percha insulated cable in London. As a substitute, the longest rubber-covered cable that had ever been made was manufactured in this country. Rubber is badly deficient as a submarine cable insulation because, unlike gutta-percha, rubber must be vulcanized. The sulphur used in vulcanization causes oxidization, hardening and cracking. Tackle, for laying the cable and also for picking it up from the depths, and transmitting instruments were obtained in England.

This surprised the cable world by lasting twenty years. In 1923 nineteen-twentieths of the current was leaking through the defective rubber insulation. Traffic in the busy summer season was delayed from twelve to twenty hours even when the cable was "open." Breaks in the covering as well as the cable proper were so frequent that it is said the cable ship crew obtained more opportunities to become proficient than any other crew in the world. Sometimes the act of hauling the cable up to the surface to repair one flaw created others in the same neighborhood. Finally in 1923 Congress appropriated funds sufficient to acquire a gutta-percha insulated cable.

No American bids for the construction of the new gutta-percha insulated cable were received and it was constructed in London. England has a near monopoly upon the submarine cable industry because the bulk of the raw gutta-percha is obtained in the oriental possessions of the Empire. Another reason for English domination of this manufacture is that the majority of the long-distance cables of the world either center in England or are owned by British companies.

Sir William Siemens, the founder of the firm that made the Alaska cable, discovered gutta-percha in the Far East and sent a sample of the odd substance to his brother, a famous German chemist, who announced its unusual waterproofing and insulating qualities to the world.

Gutta-percha is molded upon the copper wire of the cable when warm and plastic and "sets" without vulcanizing or any other aid. It has the peculiar and very helpful characteristic of not being affected by salt water, and finished cable cores have to be kept under water at all times to prevent hardening. Cable-ships carry cables that are to be laid in water-filled tanks. Or course the cable is "armored" with jute, wire and lead coverings.



Landing the new cable on Alaska shore.

The British Post Office Engineering staff assisted in the preparation of the elaborate specifications and also made technical tests of the samples that were submitted with the respective bids. The inspection and electrical tests of the cable during manufacture and upon completion and delivery were made by the Post Office for a nominal sum that merely covered the time of the men who were used, the preliminary work being done free. This courtesy of John Bull's saved Uncle Sam from having to pay a firm of London consulting engineers, who were qualified to do the same work, a handsome fee.

Cable laying in Alaskan waters can only be safely planned to be done between April 15 and September 15 and it was necessary to have the cable made in London and brought to Seattle between August, 1923, and that time in order to get it into service in 1923. Colonels Gibbs and Griffith, in charge of the purchase of the cable, found that the week-end holiday of London business executives was observed with jealous care. When the need of haste was made known, however, tradition was cast aside to furnish "service."

In preparation for the laying of the new cable, the Signal Corps had obtained the good ship *Dellwood* from the Shipping Board and remodeled her to meet the special requirements of cable work. It would have cost at least $188,000 to have the new cable shipped from London to Seattle, and when it was found that the *Dellwood* could make two trips for the cable for $160,000 that was done for the taxpayers' benefit.

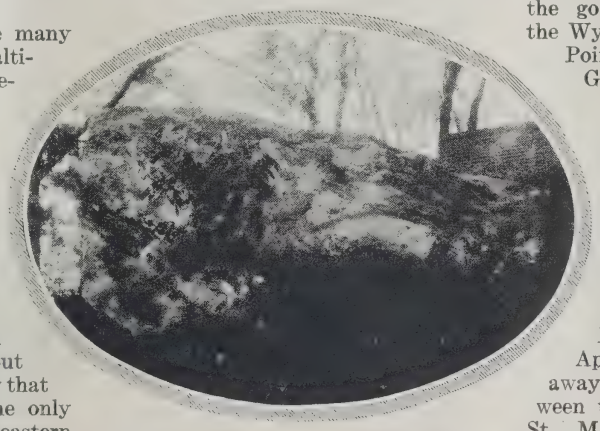
The first section of the new cable was laid between Seattle and Ketchikan, a distance of 868 miles, on May 30, 1924. The *Dellwood* returned to London, and, on October 3, 1924, the 738 miles of the Ketchikan-Seward line was completed. Seward is the terminus of the railroad to Fairbanks, 470 miles inland.

Crew in boatswain chairs placing a stopper on cable prior to cutting.

# Where American History Was Made

## Chesapeake Bay Country, the Birthplace of Seven Presidents

By W. C. POOLE



WHEN the easy-going hospitality and chivalry of the people and transportation companies going out of Baltimore give way to modern efficiency and commercialism, the Chesapeake Bay country in Maryland and Virginia will become a summer garden for American tourists. Baltimore will become the starting point from which thousands of Americans yet unborn will visit a thousand points of historic interest, from the birthplace of our National Anthem on the Patapsco to the first English settlement at Jamestown.

Scarcely does one of the many steamboats which leave Baltimore daily get under way before it passes over the spot where our National Anthem —the "Star Spangled Banner"—was born. Yet I have never seen on a single steamer anything by which the traveler might know when he reaches this sacred spot.

Thousands go to Tolchester Beach on the crowded steamers on summer days, but not one of them seems to know that only three miles away is the only battlefield monument on the eastern shore of Maryland, at Chaulk's Field, where Sir Peter Parker was killed in action by the enraged Kent County militia in the war of 1812-15. Nor do they seem to know that old St. Paul's Church, now more than 200 years old, beautifully located among ancient oaks much older, and graves almost as old, is close by. Thousands pass through the beautiful and quaint old town at the head of the Sassafras River, over the state road, without noting the old brick house on the south side of the river and knowing the story of Kitty Knight who lived there in 1812-15 and met the British with her gun ready to fire on the one who came near. The house still stands as a monument to her courage.

Even in Chestertown—the seat of Washington College—one of the oldest in the country, I found many who did not know that Charles Wilson Peale, one of America's most famous artists, was born there. These points are all reached by various steamboats running out of Baltimore. Over these Kent County roads traveled Colonel Tench Tilghman carrying the news of the surrender of Cornwallis from Yorktown to the Continental Congress in Philadelphia. Over them traveled Lafayette in his visit to America. At Massey Station he is said to have lifted his hat in humble reverence to the Creator for the sight of the most beautiful and fertile land his eyes had ever beheld.

If one takes the boat connecting with the M. D. & V. R. R. to Rehoboth, the end of the ferry is

Mary Washington's grave, Fredericksburg.

beautiful Kent Island where traders from Virginia settled several years before the officially recorded settlement at St. Mary's, in 1634. Here a fort was built. Here Claibourne ruled in his own way. Here is largely the scene of Churchill's novel, *Richard Carvel*, and William H. Babcock's story *The Tower of Wye*. Here was located the first house of worship in Maryland, according to reliable historians of the Episcopal church. The congregation still remains, though in a different building.

At Easton, as the B. C. & A. R. R. train pulls into the station, still stands on the right in a clump of ancient oaks what is probably the oldest frame meetinghouse in America. It was built by the Quakers in 1682 or 1684 and still stands as built. I saw seven of the old handmade benches which were made at the time of the building of the church. It is still owned by the Friends. In it William Penn and George Fox preached, a hundred years before Cornwallis surrendered at Yorktown.

Not far away from Easton is old Whitemarsh parish churchyard where lie interred the bones of Robert Morris, father of him who walked the streets of Philadelphia and secured enough money to keep the troops of Washington from starving and freezing during the winter at Valley Forge. Near Oxford on the Choptank is the Plimhimmon estate, the home of the Tilghmans. Up the Wye River is Wye Town, the home of the Lloyds —seven generations of whom had a son named Edward so that they were distinguished by Edward Lloyd the governor, et cetera. Across the Wye River is historic Bennett's Point where I saw the grave of Governor Bennett, buried in 1674.

By the Pocomoke River line of steamers, after touching at historic points on the eastern shore of Virginia, one sails up the river past Rehoboth where yet stands the first Presbyterian church built in America in 1682 by Francis Makemie, "The Presbyterian Apostle to America." Not far away was fought a naval battle beween the Maryland authorities of St. Mary's and those of Kent Island in early colonial days. On each side of the Pocomoke River are historic landings between cypress and pine trees which sometimes almost brush the boats. At the head of navigation is Snow Hill, one of Maryland's oldest towns. It disputes with the Rehoboth in Somerset the claim of having the first Presbyterian church in America. The old Episcopal church in this town is said to be more than two hundred years old.

Baltimore had the first steam passenger railroad in America built chiefly by Baltimoreans. For three decades prior to the Civil War, it led the way in progress. It was the center of the first telegraph line and the center of commerce and shipping.

It is only a little way down the bay from Baltimore to Annapolis, reached by steam and trolley line. In the old state house at Annapolis, Washington stood and surrendered his commission. The old buildings still standing make this city worth a day of sight-seeing even if it did not contain the Naval Academy where the admirals who have made the American Navy respected around

the world were trained. The Patuxent River line of steamers carries one up the historic Patuxent with its colonial homes on each bank.

The Potomac River line of steamers carries one from a full day and night from Baltimore, to Washington, over the old sailing vessel route, while Washington can be reached in one hour on the B. & O. or Penna. R. R. or by auto.

Two hundred years ago the Potomac River was one of the most important waterways of colonial days. Washington was born near its banks. He traced its stream to its source in his march to Fort Du Quesne, now Pittsburgh. In 1907 on my first trip over it, just after a trip up the Hudson, I said: "In one hundred more years it will be the greatest river in America for homes of millionaires." Already this prediction is coming true.

Near its mouth on the right is St. Mary's city where Maryland was officially settled. Westmoreland County on the left gave America two of its early presidents—George Washington and James Monroe, while a third, James Madison, was born close by at Port Conway across the line in King George's County. Charles County had a larger population at the first census of 1790 than it had in 1920. Old Fort Washington on the Maryland shore looks not unlike an old English castle. Mount Vernon—the home of Washington—is on its Virginia bank a few miles below Washington. The ancient city of Alexandria is only a few miles by trolley from the heart of Washington city; and Arlington, the shrine of American soldiers, where lie thousands of dead, known and unknown, was the home of Robert E. Lee.

***The Heart of Our Greatest Battlefields***

If one will here take the train to Fredericksburg, he enters the heart of our greatest battlefields.

This quaint old city—the home of Washington's boyhood, where he is said to have been the only boy able to throw a shell across the Rappahannock River—was supposed to have been visited by John Smith about 1608 in his efforts to find a waterway to the Pacific Ocean. Around it, the soldiers of the North and South surged and fought for four years of Civil War. Within a circle of 100 miles of it, more lives were lost than in all the other territory of Civil War strife. A few of the old soldiers yet remain.

Fredericksburg battlefield, Chancellorsville, where Stonewall Jackson was shot, Spottsylvania, and many other battlefields are close by, while the bloody fighting around Richmond is not far away—less than a hundred miles to the South. Fredericksburg was the halfway place in the direct line between Washington and Richmond. As the Confederates pressed northward the Federals withdrew, the highwater mark of the Confederate armies being Gettysburg for a few days. As the Federal forces pressed forward, the Confederates fought harder till Lee surrendered at Appomattox. The Rappahannock River steamboats plying from Baltimore traverse the river at regular dates of sailing.

***Where General Cornwallis Dodged the Shot***

The York River in Virginia carries one past historic Yorktown where the steamer stops. The little village, so famous in history, does not have 200 inhabitants according to the last census. The Nelson house, the Cornwallis cave where General Cornwallis is said to have sought safety from American cannon balls during the siege, the old hotel, more than 200 years old, the old custom house, still standing and used as a bank, the monument where Cornwallis surrendered his sword—almost every inch of ground seems sacred.

The James River line of steamers carries one down the James River from Richmond over the most historic river in America. The entire country is preserved almost as when the first English colonists settled. What is left of the original Jamestown Island is almost as when the colonists first landed except for the works to preserve the land from the wash of the tide, and historic buildings which have been restored. The old Jamestown church which was burned during Bacon's Rebellion, more than two hundred years ago, was not restored till the Jamestown exposition when I stood within its walls on the very spot where John Rolfe stood when he married Pocahontas.

I was told that the church register showed that over six thousand bodies had been interred in the churchyard, but less than a score could be located. On the river shore I picked up what seemed to be pebbles, but found them bits of ancient bricks of former houses which stood where the waves were then washing. A few miles over on the mainland stands Williamsburg—the greatest center of history makers in colonial days. Old Bruton Church still stands. The sexton is kept busy guiding visitors through the church and churchyard. Almost every pew has been occupied by some notable in American history. In its churchyard sleep many makers of America. Down the street is old William and Mary college nearly two hundred and fifty years old and next to Harvard the oldest college in America. The old powder horn—built to store powder in more than 200 years ago—still stands, well preserved. A guide and guide book will show you this old historic town in about three hours.

On the south bank of the river, not far down it, in Isle of Wight County stands the old Smithfield Church—built in 1632—and restored since the Civil War on its original foundations. The cluster cities at the mouth of the James reminds one of the cluster which stood at the mouth of the Hudson River.

Norfolk, Portsmouth, and Newport News are destined to be the nuclei of leading cities on the finest harbor in the world within a few years.

Two centuries, and even one century, may find them surpassing New York City. They contain more people than New York did in 1800 and are the gateway of the South where trains will meet the ferry across the Atlantic. Here will come people from the North, East, South and West for climatic and economic reasons. Baltimore at the northern end of the Chesapeake and Norfolk at the other will be the terminals of the greatest water transportation in the world. Nor is the water used only for traffic. Probably a half-million persons, directly and indirectly, are dependent upon this bay and its tributaries for whole or partial livelihood.

This section which is less than two hundred miles long by one hundred and fifty miles broad, contains the birthplace of nearly a dozen signers of the Declaration of Independence, also seven Presidents: Washington, Jefferson, Madison, Monroe, W. H. Harrison, Tyler, and Taylor. Washington and Monroe were born in Westmoreland County on the Potomac River, while Madison was born at Port Conway, in King George's County on the same river. Harrison and Tyler were born in Charles City County on the James River and when Harrison was elected President, Tyler was elected Vice-President and finished the unexpired term of President Harrison when the latter died after less than a month in office.

***The Birthplace of Some Illustrious Men***

Some day when its stone roads are completed, its steamboat lines are connected for the convenience of the tourist who must travel with speed, and its railroads are scheduled to connect with each other, it will become the tourist garden of America, through which Americans will travel by water, rail, auto and airship, glimpsing the deeds of their fathers.

YOU cannot hide any secret. We are all physiognomists and penetrators of character, and things themselves are detective. There is no privacy that cannot be penetrated. No secret can be kept in the civilized world. Society is a masked ball, where every one hides his real character, and reveals it by hiding. If a man wishes to conceal anything he carries, those whom he meets know that he conceals somewhat, and usually know what he conceals. 'Tis as hard to hide as fire. He is a strong man who can hold down his opinion. A man cannot utter two or three sentences, without disclosing to intelligent ears precisely where he stands. The universe protects itself by pitiless publicity.—*Ralph Waldo Emerson.*

CHRONICLER OF THE NEGLECTED TRUTH

# It's in the Steel, too!

THE one bearing company fully making its own steel is the Timken Roller Bearing Company.

In its own electric furnaces Timken produces the special Timken Bearing steel, compounded in its own metallurgic laboratories, from knowledge gained in successfully applying over 150,000,000 Timken Bearings to machinery of all kinds, including motor cars.

So the very steel itself assures an overlong period of attentionless operation from Timken Bearings, even though Timken adjustability is available to offset wear if it ever becomes noticeable.

From raw material to operating principle, therefore, Timken Bearings offer advantages which make them a potent economic element in the life of our time.

# Presented in This Issue:

Mr. Ford's Page this week discusses some aspects of service.

None but old American families live in New York—so one would judge by the income tax reports. The crime reports tell another tale. Crimes of violence committed for the sake of robbery rarely involve Americans. This article digs into a neglected part of the crime problem. (p. 3)

Houdini, better known as a handcuff king, is a bookman and a notable collector. This is natural in the son of a rabbi (Houdini's family name was Weiss); also it is natural that he should be interested in subjects which border religion, as reflected in his unequaled collections of books and manuscripts on magic and spiritualism. (p. 2)

A living link with Hawthorne is his son, Julian. *The Scarlet Letter* is an immortal American work, but the manner of its writing is known to few. In this sketch, a real contribution to American literary history, Julian Hawthorne tells of the inception of the masterpiece. (p. 4)

The overemphasis of sex by psychoanalysts, their browbeating of intelligent inquiring American readers with their theories and assertions, is receiving competent attention by our own scientists. Dr. Laird this week discusses Psychology and Sex in a very worth-while article. (p. 7)

Here are three distinctly important items concerning taxes. One deals with the head tax. It seems that the law directs how that tax shall be used, and it has not been used that way. This deserves official as well as general attention. (p. 22) A statement by Senator Smoot which contains the essence of his long experience in handling the financial problems of the government. (p. 6) A comparative table showing the tax burdens of five nations. Our own taxes are second highest in the world, but lowest in percentage of the national income. (p. 6)

Tom Masson says the best reading is biography. It's true. That explains the fiction appeal—it is biography, the lives of people. Today biography is better than it ever has been since Plutarch. Mr. Masson doesn't say that, but it is. (p. 8)

The Bible is biography, poetry, philosophy, history, apocalypse, law and letters. Scholarship has corrected the vagaries of rationalistic speculation so that the Bible is no longer at the mercy of Modernists nor beholden to the Fundamentalists for defense. It stands on its own feet, and the scholarship of the first century (there was a scholarship then!) is shown to be sound. Dr. Sanders, a recognized authority, writes about it. (p. 26)

The Patent Office holds the secret of America's greatness. Most of the ideas which have been patented are useless, but the rest have changed the world. Even the useless ones prove us to be a nation of thinkers and inventors. Some of the humors of patents are given. (p. 16)

In one of the last articles written for us before her sudden death in China, Mrs. Cramer told in her friendly way of birds that sing and girls that "yawl" in Shanghai. "The Hundred Spirits Lark" and the "Spectacle Thrush" are species we are glad to be acquainted with. (p. 12)

Where was the last battle of the Civil War? Here is the story told by a North Carolinian to a North Carolinian about this interesting item in North Carolina's long and varied history. (p. 25)

Wander through the woods with Jim Smiley. (p. 13)

# HOUDINI
## The Book Man

GHOSTS and goblins and all affrighting apparitions must shudder when they hover about the contents of No. 278 West 113th street, New York City, the residence of Houdini, the magician.

This famous exponent of stage magic has assembled the largest library of witchcraft, spiritualism and psychic phenomena to be found anywhere in the world.

Two hundred years ago Houdini, with his knowledge of what was then known as black art, would have been in danger of the stake. Today, he earns enough in five months to spend the other seven in ransacking the world for additions to his library, in cataloging them and in serene living among his treasures.

Houdini always does his own buying of books and manuscripts; he is not merely a dealers' client. Whether in European capitals or in remote American towns the secondhand bookstore has its lure, for the most unlikely place may yield an unexpected find. Into this quest Houdini puts the time and energy that other successful men usually devote to golf.

A fortunate incident in the accumulation of this library was the relation with it as librarian of Alfred Becks, a fine actor and student of the literature of the stage, who became the Boswell of the magician for ten years. Becks was himself an inveterate collector of old books and sharpened the already keen appetite of his employer.

In his youth Becks had been an intimate of Charles Walter Couldock, who had been a chum of Edmund Kean. Kean in turn had contact with a group of famous actors of the preceding generation who had brought down, in the spirit of the ancient guilds, the "business" of Burbage who was actor-manager of William Shakespeare and those who succeeded the immortal pair. As private secretary of Dion Boucicault, who gave the heroic type of play its great vogue in America, and later as a worker, in the library of the theater at Harvard, Becks was still further qualified to assist Houdini.

Becks' recent death requires Houdini to devote still more of his own time to library affairs.

The Houdini library contains many important collections of letters, among them a large number of those of Richard Mansfield, the brilliant actor. There are about one hundred letters of Clyde Fitch, the playwright of the last generation, whose fame, in vivid contrast with that of Mansfield, rests largely upon his winsome disposition. Then there are packets of letters written by Edmund Kean, Jenny Lind, and Mrs. Siddons, as well as more than a hundred letters of Edwin Booth.

The manuscript record of David Garrick, autographed in his own hand: *David Garrick's Original Diary*, is the most prized volume in the theatrical section of the Houdini library. No more intimate and significant souvenir of the life of the

HARRY HOUDINI.

# Note the Names of Our Criminals

## Are They Foreign or American? What Do the Police Records Say?

By ALLAN L. BENSON

EVERYBODY is wondering why there is so much more crime in America than there ever was before. A National Crime Commission has been organized for the purpose of trying to answer the question. Foreigners are somewhat astounded that a people who used to be ordinarily decent have suddenly shown such strong tendencies toward crimes of violence that have robbery as their purpose. Many Americans believe that Americans are going bad.

A very interesting situation—but not one that can be solved with a sentence. Still, some light can be thrown upon it if the beams be projected from the right angle. This will be an attempt to get the right angle.

***Liberty, the Magnet That Drew the Pioneers***

Let us go back a little. Why are we here? What caused us to come to America? Let us first find the answer for the "Old Americans," as those families that have lived here for seven or eight generations have been called since the war. What was in the minds of their ancestors as they set sail from Europe? Riches? No, no, no! There were no riches for anybody in America. There was a wilderness to clear, Indians to fight, and all the hardships of a new country with which to contend, but these pioneers who pushed off from Europe when from six weeks to three months were required to make the crossing had no hopes of wealth. If they could escape death and make a comfortable living they would be content.

But America had one thing that they wanted and wanted so intensely that they were eager to go far from home and stay away for life to get it. And that thing was liberty. The desire for religious liberty chiefly actuated those who came first. Political liberty most moved those who came later. But liberty, in some form and all the while was the great magnet that for more than 200 years drew Europeans to America to become the founders of families that exist to the present day.

Within the last 25 years there has come a great change. We have become far and away the richest country in the world. Europeans talk of nothing else when they talk of us except how rich we are. The more ignorant the Europeans are, the richer they think we are. They have heard so much about the colossal wealth of America, and the suddenness with which fortunes have been accumulated that they think this is a land literally overflowing with money—a land in which any active person can get a lot of money in a short time.

Liberty? They never think of it. Money? They think of nothing else. They come to America for money.

Do they get it?

*Read the names printed in the income tax reports. You have been told that New York is to all intents and purposes a foreign city. If you were to read the income tax reports you would think that New York City was composed almost exclusively of old American families.* The list contains a sprinkling of obviously foreign names, but the great preponderance are American—that is to say, of British origin.

At this point, consider another factor. Nobody but a foreigner can know fully, and nobody who has not gone to Europe and returned home can know at all, what it means to move into the atmosphere of America. You feel the thrill before you are off your ship. You feel that you are moving into a place where something is doing. No brooding silence hovers over the bay of New York. The comparative quiet of Cherbourg and Southampton are missing. The water is alive with flitting craft, tremendous buildings look down upon you; the very air seems charged with abounding energy.

Please don't underestimate the effect of these great forces as they play upon immigrants who have come to America, not for liberty but to get rich overnight. They think they are in the right place. They have not scanned the names on the income tax reports for previous years. They do not yet even dream of the disappointment that awaits them.

These immigrants get off the ship and begin looking for their fortunes. They see and feel wealth all around them, but they have difficulty in getting hold of more than enough to pay their living expenses.

***Very Few American Names Are Among These***

Those who have a heritage of law and order in their natures make the best of it. Some who lack this heritage, yet have in its place a thirst for money that cannot be quenched, go out with guns to get the money that they cannot earn.

*Observe the names of those who are arrested in connection with crimes of violence committed for the sake of robbery. You will find very few American names among them.* You will find very few British, German, French, Norwegian or Swiss names. But you will find a great many names of Russian Jews and Italians.

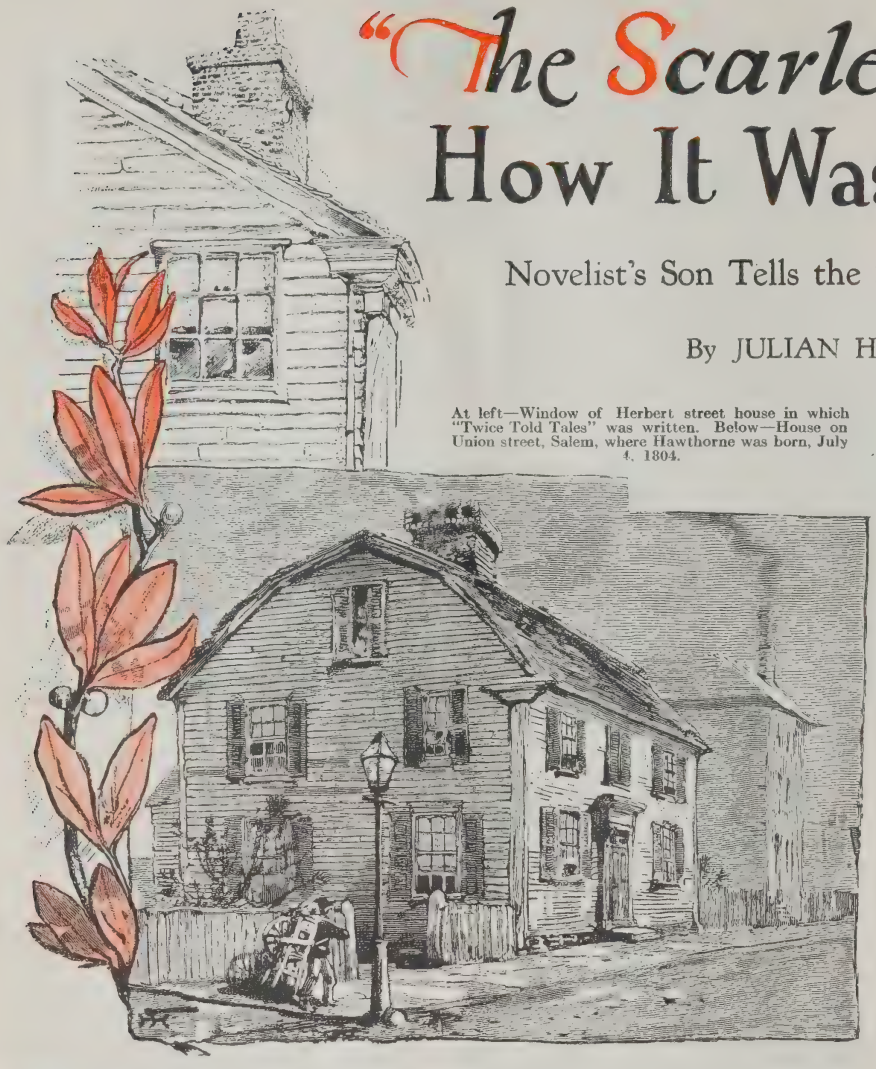
Edmund Burke said he would not know how to draw an indictment against a people. What Burke couldn't do, no sensible person will try to do—or will want to do. Most Russian Jews and most Italians are as law-abiding as anyone else. But there appears to be a minority of each that is capable of the most terrible crimes. There appears to be a minority of each that having come to America for nothing except money is determined to get it even at the cost of bloodshed. It is certainly not without significance that the great majority of those who commit crimes of violence for money in the United States are either Italians or Russian Jews.

***They Did Not Want Sicilians and Calabrians***

The writer happens to know that decent Italians are very much ashamed of their indecent countrymen. A former Italian ambassador to the United States was visiting Italian colonies in various parts of the country. In California where Italians have long been and are much respected, the ambassador asked what he could do for them. "Keep criminal Italians out of America," he was told. "We need no help. We can take care of ourselves. But keep the murderous Sicilians and Calabrians at home. You know we don't recognize them as Italians, but Americans do, and they are disgracing us."

Whoever knows Russian Jews knows that most of them are law-abiding and many of them are very excellent persons. I have known many such. But, like the Italians, each group contains a minority that seems capable of any crime to get money. Most of the crimes they commit have "property" elements.

America's tremendous vitality appears to amplify the determination of certain types of immigrants to get money at any cost. They came here for nothing else; they will have nothing else. If they cannot get it legitimately, they will get it illegitimately. That is what they are doing, at any rate.



Some say the way they plan and execute their daylight crimes, committed perhaps in a crowded street, shows both unusual intelligence and a high degree of daring. This writer does not see it that way. They show cunning, of course. And, as for courage, they have a palsied imagination that cannot visualize even the immediate future and therefore are not alarmed by it. Courageous men do not shoot down those who are unarmed and have no chance to defend themselves.

There is also reason to believe that those good people who persistently violate the prohibition law have a far greater responsibility for certain crimes than they perhaps realize. Every person who drinks liquor *(Concluded on page 18)*

# "The Scarlet Letter" How It Was Written

## Novelist's Son Tells the Story of a Famous Book

By JULIAN HAWTHORNE

At left—Window of Herbert street house in which "Twice Told Tales" was written. Below—House on Union street, Salem, where Hawthorne was born, July 4, 1804.

AMONG truths not generally recognized I am inclined to include this—that *The Scarlet Letter* was published seventy-five years ago this year. My father was then forty-six years old: he had been writing short stories and essays for twenty-five years past, and two or three volumes of these had been printed; nevertheless he was, if not (as he declared) the obscurest man of letters in America, one of the farthest from the spotlight.

And when he had written the last page of *The Scarlet Letter* and had put the manuscript away in his little mahogany desk, he was far from foreseeing its renown; in his judgment it lacked, as had his previous writings, the qualities that bring popularity. It was too gloomy a tale, and the fact that it was longer than anything else he had done made its success still more unlikely. He must have known that it had merit; but the public which appreciated such merit appeared to be a very small one in 1850. So he didn't even offer it for publication; and it was mere chance that brought James T. Fields to his house in Mall street, Salem, asking if he hadn't anything to submit to the firm which Fields represented.—Nothing worth while, Hawthorne thought; and it was only because his wife rose in revolt against this statement, that he was induced to open the old desk and hand out the two or three hundred closely written sheets of paper.

Fields was in his thirties then, a clever, diplomatic, agreeable young fellow, with literary aptitudes of his own, and a temperament at once optimistic and judicious. He began reading the romance then and there, and was not long in perceiving that the thing would "do," though he was doubtless not aware how much! It would pay to publish a limited edition of it, and he took the manuscript away with him with cheerful assurances to the surprised and still doubtful author. In due time the limited edition appeared, perhaps fifteen hundred copies. And then came the real surprise for author and publisher both. The "very small public" which had hitherto taken notice of his work grew to thousands and to more thousands overnight; even the voice of England became audible; and active translators in France, Germany, and Italy spread the news over Europe. The obscurest man of letters in America had become a worldwide celebrity; like Byron, a few decades before, he awoke to find himself famous.

Where, I wonder, is that publishers' presentation copy of the first edition that stood so long on our bookshelf? I don't think my mother would have let my father give it away; in the various removals of the family it must have been mislaid. Did it perish, like other mortal things, or did somebody find it and preserve it? Several copies of that rare first edition are extant but that unique copy has never been heard from. It bore on the flyleaf the signature of Fields and of Nathaniel Hawthorne. There were few collectors of rare volumes in those days, and the prices they command now were inconceivable to our innocent forefathers. I won't venture to guess what that copy would bring at auction, but I am sure the sum would exceed that of all the royalties paid to the author during his lifetime.—Look over that heap of old plunder in your attic; it may be there, and you could buy several good automobiles on what it would bring in the market.

Persons like Longfellow, Lowell and Oliver Wendell Holmes recognized the star Down East promptly. Longfellow wrote a good academic review of it in the best Cambridge style; Lowell was cordial and scholarly, and Holmes, in one of his "occasional poems" hit upon a good phrase:

"I snatch the book along whose burning leaves
His scarlet web our great Romancer weaves!"

That "snatch" was characteristic of the impulsive and ardent author of *The Professor at the Breakfast-Table*, and the snatchers have been numberless during all the three-quarters of a century since then.

Indeed, after the copyright on the book ran out, many other publishers all over the country began bringing out new editions, cheap or de luxe, illustrated or plain; so that many readers, coming across it for the first time, supposed it to be a new book. Not long since I received a letter from a lady in the Middle West, in which she said: "In my opinion it is the best thing you have ever written"; and in my reply, thanking her for her praise, I added

that it might interest her to learn that the story was composed when I was only four years of age.

The significance of this anecdote, as Captain Cuttle might say, lies in the application on't. How could the lady have supposed that a story written seventy-five years ago was just hot off the press? Styles change in writing, almost as fast as they do in ladies' dresses. You can distinguish a book of even 1900 from one of last year, especially a novel with dialog. Of course, the scene in *The Scarlet Letter* is set in the seventeenth century, but in the direct narrative the writer would still betray his own date. We hear—or we used to, before the birth of the contemporary critic—of "the well of English undefiled," but an author who should attempt to fill his pitcher from that source today would risk getting something fatally colorless. The Mencken school wouldn't stomach it; have they not declared poor old Milton's efforts to be "piffle"—or—was it Dante?

Moreover, to go back to my correspondent, my father's style is not colorless, however grammatically correct it may be, and free from slang. It is not addicted to "purple patches," but it gives out rays, at times, of gold, crimson or azure, which we accept without complaint because they harmonize so well with the thing said. In *The Scarlet Letter*, too, a grave organ-tone is audible, a music that comes near being rhythmical occasionally. But this is also something that we feel rather than remark, on account of its sympathetic quality; the sense of the passage demanded it. It isn't an antiquated style, nor deliberate nor self-conscious; it is personal. And it is personal without being humoristic, as is the style of Swift, Sterne, or even of our own Washington Irving; it is nothing but my father expressing himself as simply as he can, with no intention of calling his reader's attention to his language, but solely to the matter which he is expressing. And plain speaking is of no date, any more than is a reflection in a plate-glass mirror. The glass may be tinted, but it is straight and true; and the writer cannot escape his temperament, but he can tell the truth so far as human limitation allows. *The Scarlet Letter* is truth; anybody can tell the truth that he sees and feels; but nobody had before or has since written a Scarlet Letter as Hawthorne wrote it. It isn't Elizabethan, or Queen Anne, or Victorian, or Georgian—not either antique or modern in a word: it is just Hawthorne. And, therefore, it had no predecessor and has had no imitator, and the lady who wrote me that letter, not finding in the book any earmarks to fix its date, had a perfect right to think I did it; I am a "Hawthorne," and she, probably, may not be a profound student of literature.

Stencil plate, now in the custom house.

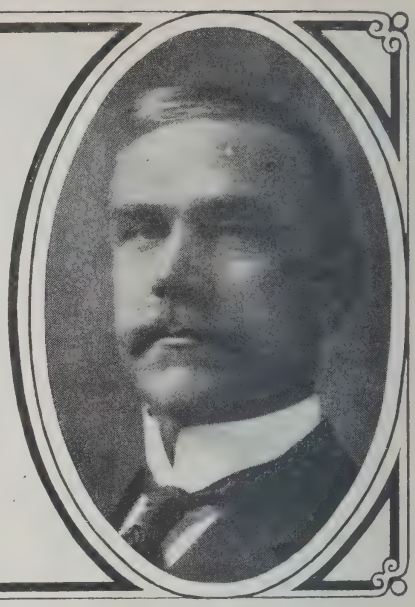
Desk used by Hawthorne in Salem custom house.

Had she been a profound student of literature, or even of Hawthorne in particular, she might have noted that *The Scarlet Letter* is written in a style not quite like that of any of his other novels, or of the short pieces. This is due in part to the theme no doubt, but also to the personal circumstances in which the story was composed, which were exceptional.

For some time previous to 1850 my father had not written at all; the profession of writing had brought him no money, and, having married, it was necessary that money should be forthcoming. With the help of friends he got appointed surveyor of customs in Salem; the pay wasn't much, but with an economical wife it was possible to exist on it. His mother, a woman approaching seventy, and in ill health, came to live with them; my sister Una, six years old, and myself, made up the family. The house was an old and unbeautiful one on Mall street. The children presently caught the scarlet fever; and the illness of Mrs. Hawthorne, the elder, became serious.

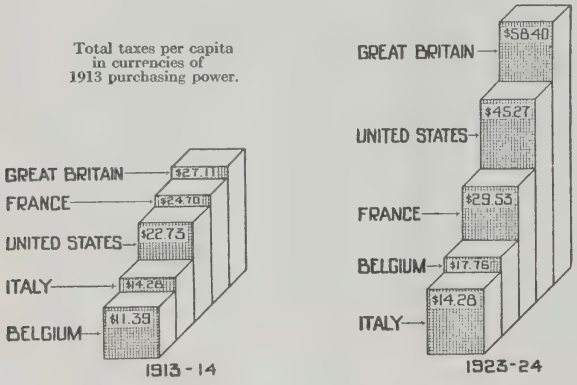
The surveyorship was not congenial to my father, glad though he was to have it; but, as often happens with uncongenial things, it was good for him. His life had been singularly solitary up to that time: his childhood and boyhood homekeeping, with a mother and sisters almost as companionless as himself; my uncle, Horace Mann, had not yet been born, much less got his public school system going, and Salem was not a community promiscuously sociable. As he grew older he was taken to a wilderness up in Maine, to which the Hawthorne family had a claim; he used to tell me how he skated on Sebago Lake, and followed the tracks of a bear through the snow.

A benevolent Uncle Robert, somewhat against the boy's inclination, caused him to be prepared for Bowdoin College, and thither he went in his seventeenth year. This was his first experience of the society of youths of his age, and he made a good record, not as a scholar, for he was not captivated by the college curriculum, but as a manly and robust character among his fellows. But after those four years were over, he retired to the old house on Union street, Salem, shut himself into his room, hardly saw even his mother and sisters (though they were all very fond of one another) and took his walks abroad chiefly toward sunset, when most people were at home, and those who happened to pass the tall figure striding swiftly along didn't know it was Nathaniel Hawthorne. Except for a few excursions into the wild Berkshires and Northern New York State, and an acquaintance intermittently kept up with a very few chosen companions, nobody saw him, knew him, or was aware that there was such a person.



This went on *(Continued on page 19)*

SENATOR REED SMOOT'S STATEMENT ON TAXES.



"In my opinion the Government of the United States should impose no inheritance taxes whatever. This should be left entirely to the states. The Government of the United States has nothing whatever to do with the transfer of title of property left by deceased persons to their heirs or beneficiaries.

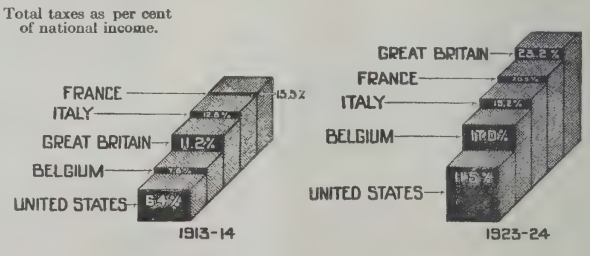
An inheritance tax is a tax upon capital and not upon income. If I had my way, the states would never impose an income tax and the government never impose an inhe itance tax. I am in hopes that some time or other there will be an agreement between the government and the states covering these points.

The income tax and the inheritance tax imposed by a few of the states of the nation are such that no running business could liquidate within a couple of years and much more than pay the taxes. In fact, one business in the United States in one of the states was unable to meet the taxes of both the state and nation.

# Comparing Tax Burdens in Leading Countries

TAXATION in the United States nominally has more than trebled since pre-war days. The total amount of local, state and Federal taxes levied in the fiscal year 1923-24 amounted to $7,716,000,000, as compared with $2,194,000,000 in 1913-14. Taking into account the decrease of purchasing power of the dollar during the war decade, this represents an actual increase in the tax burden of two and a quarter times that of the last pre-war year, according to the National Industrial Conference Board analysis.

Per capita taxation more than doubled in both the United States and Great Britain. But Great Britain in 1924, six years after the signing of the Armistice, led all allied countries both in amount of taxes levied per head of population and in the proportion of total national income diverted into channels of governmental expenditures. France, Italy, Belgium and the United States follow in order according to the burdensomeness which their respective tax system imposed upon their people as measured by the relation of taxes to national income.



British per capita taxes, amounting to $27.11 in the fiscal year 1913-14, had risen to $58.40 in 1923-24, in terms of 1913 purchasing power. Per capita taxes in the United States, figured on the same basis, increased from $22.73 in 1913-14 to $45.27 in 1923-24. In France, the increase was from $24.70 to $29.53; in Belgium from $11.39 to $17.76; in Italy the per capita tax remained the same, $14.28, taking into account the lower purchasing power of the 1924 currency. Comparative figures for Germany are not available.

In both the United States and Great Britain taxation in proportion to national income approximately doubled; in Belgium it more than doubled since pre-war days. The total tax burdens of the principal nations associated in the World War against the Central Powers, as related to national income at the beginning of the war and ten years later, are computed by the National Industrial Conference Board as follows:

| | 1913-14 Per Cent | 1923-24 Per Cent |
|---|---|---|
| United States | 6.4 | 11.5 |
| Great Britain | 11.2 | 23.2 |
| France | 13 3 | 20.9 |
| Italy | 12.8 | 19.2 |
| Belgium | 7.8 | 17.0 |

While taxation in the United States and Great Britain increased in about the same proportion, and these two countries levy the highest per capita taxes among the allied nations, the greater material wealth and productivity of the American nation make its tax burden comparatively lighter than that borne by any of the European allied countries. Net revenues in the United States, moreover, are spent largely for universal education, good roads, public buildings, parks, and other reinvestment of the taxpayers' money, the Conference Board analysis indicates, while the proceeds of taxation in Europe are to a great extent absorbed in paying the cost of past wars.

In the case of Great Britain the payment of unemployment insurance, otherwise the "dole," absorbs many millions of pounds sterling.

# Psychology and Sex

## How Far Does the Mind Affect the Body?

By DONALD A. LAIRD, Ph. D.

ILLUSTRATED BY W. W. CLARK

A REFINED young woman went to her family physician after being treated by some of the foremost neurologists in Europe for a slight but bothersome paralysis.

"If you would only let me talk to you and if I could only tell you how my difficulties started," she said, "I think we could do something."

So to Dr. Breuer she told about her paralysis and rambled on after the fashion of the gentler sex only to discover soon that as she told of her paralysis and its origin she was revealing also many of the very intimate things of her life. With much feeling she continued her narrative, only to be interrupted by the physician who had another appointment.

She asked him for another appointment, and another. Each time she told him of many things of which she had not thought for years. Each time after she had poured forth the accumulated troubles of her life her paralyzed condition seemed to improve. Gradually one symptom after another began to disappear. So effective did this treatment seem to be that she called it very appropriately "the talking cure." She talked out of her system, as it were, the poisons that were the cause of her paralysis. They were mental poisons and not the sort which come in drug bottles with a skull and crossbones on the label.

A few days later Dr. Breuer received a call from a young physician who had just come from special study with Charcot, the renowned French physician who specialized in hypnosis. This young physician was trying to solve the riddle of the patient who *seems* to be paralyzed but in whom the neurologist can find no nerve disturbance. He had journeyed to Dr. Charcot's clinic in Paris and there saw these functional, as distinguished from organic, paralyses removed by hypnotism.

The young physician told Dr. Breuer how a normal person could be hypnotized and instructed while in this condition so that on the following noon he should complain about the food. And on the following noon, as directed, he *would* complain of the food, giving some flimsy reason to justify his actions. The real reason, of course, was that he had been so instructed while hypnotized on the previous day, but of that instruction he had no memories. This phenomenon of post-hypnotic suggestion, the younger physician related, was used by Charcot in treating cases of functional paralyses in which no disturbance of nervous tissue could be found.

Not only could these paralyses be relieved in this way but they could be produced by post-hypnotic suggestion! When hypnotized, for instance, you could be told that for the following day you would be unable to move your right index finger, and move it you could not. Or you could be told that you would not be able to feel pin pricks and a sensory paralysis would be started.

Then Dr. Breuer recalled the young woman who had joked about her talking cure which did her so much good. He told his visitor about this interesting case. With the memories of his experiences in Paris fresh in his mind we may imagine the younger physician slapping his knee as he was struck with the similarities of this case and some of Charcot's.

When a post-hypnotic suggestion had been given, for instance, to a young man to send a box of bonbons to a man-hating old maid, he would give some easy excuses for it afterward. But he would not be able to recall the suggestion that had been given him while hypnotized. All his alleged reasons for this conduct were *rationalizations*. But if pressed further and further to probe the depths of his memories he might gradually revive a dim memory of the instructions which had been given him by Dr. Charcot. In this the younger physician saw a parallel to the young woman who originated her own talking cure.

This happened in Vienna. The younger physician was Sigmund Freud. Vienna is now considered the cradle and the capital of dynamic psychology and Dr. Freud is undeniably the founder and principal contributor to this newer psychology.

On other patients the talking cure was tried and found successful. Since it appeared to be efficacious by relieving pent-up emotions within the individual it was later called the cathartic method since the patients purged, as it were, their mental life of some disturbing memories.

In almost every case they studied it was found that some long since forgotten event which had been painful was at the bottom of the (*Concluded on page 24*)

The writing cure for "nerves."

# The Best Reading in the World

By THOMAS L. MASSON

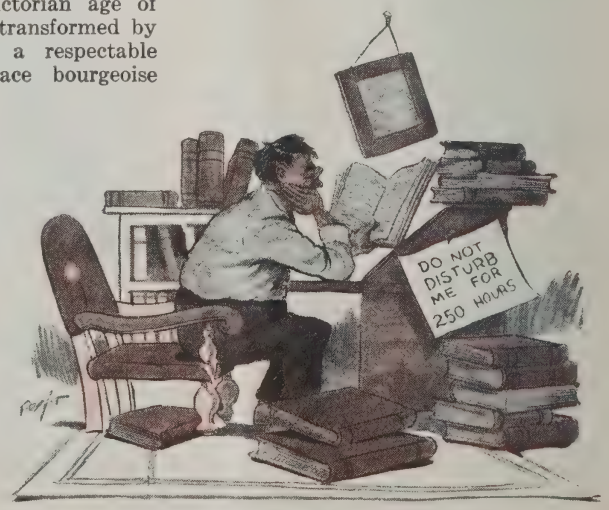
"Almost anybody who has done anything . . . has been writing his memoirs."

GOOD biography is not only the best reading, but the most useful. We are likely to overlook the fact that the world, as it is today and as it has been in the past, has been made by men and women. If we wish to get at the bottom of what is going on or has gone on, we will save ourselves much time and trouble by going to headquarters. That is, to the men and women who have made the world.

Almost anybody who has done anything, and apparently a great many who have never done anything at all, have been writing their memoirs. We have been deluged with biographies, diaries, autobiographies, reminiscences and particularly with what has come to be known an "uncensored" recollections. Shocking the public would seem to be the chief occupation of those who write. A few years ago an anonymous author in London startled the world by publishing *The Mirrors of Downing Street*, by "A Gentleman With a Duster." This was a more or less revelatory account of certain British notables, and in this country was followed by *The Mirrors of Washington*, by a man who has since been disclosed as a well-known Washington correspondent. Long before this, in America, Thomas Lawson, that meteoric financier, in 1905, wrote his *Frenzied Finance* and became known as the original muckraker (a term used by Bunyan in *Pilgrim's Progress* and applied, apparently to Lawson, by Theodore Roosevelt in 1906). Lawson spared nobody. His description of the eyes of H. H. Rogers, of the Standard Oil Company, still lingers. His books have long since faded from the public mind and he himself, along with those he pilloried, has passed away. But the fashion was set.

A perusal of many autobiographies seems to bear out the often-expressed statement that no man ever really tells the truth about himself. What seems to be true, even when it is more or less shocking, may be an evasion or a perverted piece of egoism. What the world thinks of a man, what his associates think of him, what he thinks of himself and what he really is, are four angles from which he can be viewed separately. *But the last one will always be a mystery.* Nothing in recent times could better illustrate this biographical uncertainty than the life of Woodrow Wilson, as recorded by himself and his contemporaries. His style of writing has been denounced as atrocious, a whole scheme of evasions, while side by side with this he has been hailed as our greatest master of English. I have read practically all the books about him from Tumulty to White, and each one paints a different portrait. We may well ask ourselves: If, going on right under our eyes, and about one who is perhaps the most important figure of our own time, a man who has recently lived among us and is known personally to many of us—if about him there has grown up already a considerable literature so confusing and contradictory, how is it possible for us to be sure that we know anything trustworthy about any great man who has ever lived? About Caesar, Napoleon, Washington, Lincoln, Shakespeare?

That a personality which has, over a period of several generations, become fixed and venerable can suddenly be turned into quite another personality is shown by the publication of Lytton Strachey's *Queen Victoria*. This eminent woman, the noblest and most royal figure of that age, which, perhaps largely through the idea of her own personality, has become known in life and letters as the Victorian age of culture, was suddenly transformed by Strachey's book into a respectable and wholly commonplace bourgeoise old woman, delightfully dull and deplorably respectable. This was done with the apparent approval of the most conservative public in the world, by a series of delicate and benignantly satirical touches—all, however, the result of painstaking research.



We have to train ourselves in reading these biographies to look between the lines and constantly readjust the writer's own estimate of himself in accordance with our knowledge of our own lives. Thus you may read Benjamin Franklin's book about himself over and over, and each time get something new out of it. Read for example what he says about beer in London. Read how he confesses to certain irregularities, especially about money. There is a whole lot more you get about him by inference.

Benvenuto Cellini's life is such a revelation in human nature that to read it is like having a supreme adventure—one can never be quite the same again.

As for Plutarch, frankly, he is hard reading for a modern, in spite of the fact that Dr. Johnson sat up all night over him. But certainly he furnished by far the most necessary background. There are several translations. The one I have and like is by Clough. Do not miss Alcibiades and Pericles.

I recall quite vividly the day I received Senator Beveridge's *Life of John Marshall*. It was originally published in four volumes, and it never occurred to me to read it through. However, once I got started I dropped everything superfluous for two weeks until I had finished every line of it. It seems to me necessary reading for every American who wishes to understand our Constitution. What a human person was Marshall! How wonderful to his pathetic wife!

If you are at all interested in music or have heard any or all of Wagner's operas, do not read books about Wagner, as good as they are (Newman's is one) but read Wagner's book about himself. The fun comes in reconstructing him as you go along.

"We have to train ourselves in reading . . . etc."

# MR. FORD'S PAGE

CHURCH, school, factory, store, no institution can survive that is not based on service. And it must be more than lip-service; it must be the thing itself. It must be more than the modern preachery imitation that repeats by rote, service, service, service; it must be something done, something measureable, something known and felt.

Service is the one element that never fails, because it is the one element that people always want. Service cannot be bought or sold, it can only be given and received. It is the bloom, the flavor, the spirit which gives value over and above the intrinsic elements involved. But bloom and flavor and spirit are the very elements which men value most and cannot live without.

It may be put down as truth that any activity that is languishing is in that condition because it has run short on service. If the church complains of the indifference of men, the church needs only to be reminded that men are never indifferent to service—they need it and are looking for it everywhere. The church has a good deal to say about service; it gives its meetings that name. But men have shrewdly felt that a good deal of the service urged is service to the church.

If any other institution in the world thought to survive on the plea that men should be faithful to it and support it, our estimate of its soundness of judgment would be unfavorable. Our great stores and railways do not ask the public to be faithful to them and support them. They know that they have only to give service and they will have all they can do. When they fail, they have simply stepped out of their place in the scheme of life. Therefore, the plea of the church for faithful support, as if it were the ordained recipient instead of the source and distributing center of service, indicates that it has failed somehow to connect with the needs of men. Supply never requires pleas for its support. Supply is always besieged by need.

The whole secret of success is to fit oneself into the fulfilling of some need. Such a one's life is justified. The legitimate satisfaction of legitimate needs keeps the social and moral balance of the world; all else is illegitimate and destructive of social harmony.

*WHEN Service evaporates into a preachment, men lose sense of its reality and begin to scorn its name. The truth is not thereby altered that the measure of usefulness and success is service, as a super-quality, an overtone in all exchanges. Giving is primary, getting is secondary. The priming act which eventuates in reward is service. Getting is necessary, of course, and here short-sighted minds stop short: the deeper truth is that giving is necessary to getting. Wherever business, education, politics or religion languishes today, the cause is found in holding up on service.*

Need always exists everywhere for keen self-examination of life and activity from this point of view. There is a great deal of talk about it. Practically every noonday lunch club has something in its constitution about service, but it is not often that anyone descends to particulars. And possibly one cannot very well do this for another. In that case we should do it for ourselves. There should be something resembling an inventory of the amount of service we render the world for the amount of service we receive. No individual can ever square the debt. In this great experience of life we are all greater gainers than we are givers; but the fact remains that we should all be greater gainers still if we were only greater givers.

One by-product of genuine service has escaped us. The world is so constituted that we cannot give anything wholly away. Even "he that loses his life shall save it." In service the served man is not the greatest beneficiary, but the servant, for he learns by what he does, and his capacity for doing increases. This servant may be a factory; take the factory that gives the greatest service, and you will find it able to do the greatest number of things. Its whole attitude has been a willingness to learn how to do more, instead of studying how to do less, and as a consequence its ability has increased. The more it gave, the more it had. The more it studied to increase its patrons' return, the more it increased its own mastery of its method and its market.

This still remains only a theory to too many people, a nice sentimental and airy nothing that works in speech but fails in work. To such people the uncertainty of business will always be a fact, and their lives will be spent in the dark delusion that the highest skill is getting instead of giving. They think they are wise because they see that getting is essential. So it is, but getting is the result of giving. Even for the little they get they must give a service, however meager, grudging and unintelligent it may be. They have hold of the truth by the wrong end. Their formula is reversed. Giving is the first, the priming action; it starts the exchange; increased, it increases the exchange; made the rule of life, it makes life beautiful and rewarding, its plainest tasks an illustration of its deepest laws.

## *Results—Nil, So Far*

MERRILY the din of accusation and advice rises in Washington. Most of the accusation is true, most of the advice punk. The whole is illustrative of the illusion that government represents the cream of the people's efficiency and progress. It doesn't. Governments go when they are pushed, not otherwise. Doubtless the defense of the United States could be undertaken by private contract at less than half the cost of the present method, but it never will be. Efficiency, a definite scientific and moral relation between expenditure and value received, is not one of the ideals of present-day life; we approach it in private life only because necessity compels. This compulsion has not begun for government. Certainly the War Department and the Navy Department are behind the times; but so are the Treasury Department, the Department of Justice and the Weather Bureau. They are all behind the times. It is not their business to lead. That is the people's business. And as the people have been very busy about their private affairs the past quarter-century, the government has just naturally deteriorated. Every business does when its boss neglects it.

About all that has come out of the present defense controversy thus far has been a pronouncement by the President, which is probably the weakest of all his utterances, and a proposal to combine air, naval and army matters under one cabinet member. This latter proposal would dispose of the Secretary of War and the Secretary of the Navy and at the same time would permit the establishment of Colonel Mitchell's department of the air. But they would all be under one Secretary of the National Defense. The difficulty having been to get competent secretaries for these separate departments, who can guarantee a man big enough to combine three departments and manage them efficiently? The man who could do that is not in politics. The presence of a man in politics today is almost positive proof of his incapacity for such a job. And, besides, Mr. Coolidge will probably have nothing to do with it. In which he will, of course, be wise. He has struck his note, Economy, the only one of his that ever sang across the country, and he will do well to play all possible variations of that.

## *Citizens! Retake Your City!*

THE city of Detroit chose a site for a school, but found it surrounded by what the newspapers call vice. Then it chose another site, and found more vice. Whereupon an argument arose as to which locality had the more vice, which was duly superseded by another argument as to whether it made any real difference even if school children were sent to school through a corridor of vice districts. In the meantime plain citizens must have been doing some thinking, but of this no public sign appeared. The incident is illustrative of our decreasing capacity, as communities, for moral indignation. Fifteen years ago the public sentiment of Detroit would have made short work of such a condition; today, the condition is not even realized, it is merely a matter of "something read in the paper." The sense of responsibility which citizens everywhere used to have toward their cities is disappearing. The "city" is regarded by citizens as a detached entity which they may regard as from a distance if they are interested, which they seldom are. The war between the law enforcement agencies and the crime groups is observed distantly, as a tribal war in Morocco might be—it doesn't mean anything; both police and criminals appear as alien interests. The citizen has been so long shut out from his city by politicians and their groups, that he reads of downtown affairs as of occurrences in a foreign land. One of the sensations of the future will be the overturning which will occur when Citizens retake the City.

## *Will the Church See It?*

IN A letter addressed to members of the Protestant Episcopal Triennial General Convention and signed by a long array of distinguished communicants, these statements appeared:

"We wish to call attention to the rapid spread of socialistic ideas in our church. We believe that many clergymen and laymen, animated by a sincere desire 'to make justice and love the controlling motives in all social changes' have adopted too eagerly and without due scrutiny, principles that, in reality, are unsound economically, hostile to Christian ethics and subversive of morality and religion. . . . .

"We believe that they are unwittingly lending themselves to forces whose ultimate

purposes they abhor. . . . If the men and women who would lead the State toward Socialism looked more deeply beneath the surface they would find powerful forces at work which are making for the undermining of the foundation of American principles on which our Nation was founded."

The warning might have been clearer, the enemy more sharply defined, the method of "boring from within" more completely set forth. Anti-Christian, anti-American forces have many dupes in the pulpits of this country, dupes deceived by their own ready inclination toward words that sound right, with no desire or ability to study their tendencies. The church has been almost manhandled in the freedom with which its apparent influence has been put behind this scheme and that, and its publicity agencies have been almost wholly annexed by propagandists. Some day, when the church has opened its eyes sufficiently to be able to understand what it is all about, it may be useful to set before it the full extent to which it has been "used" under the guise of social progress.

## *Hamlet—1925*

A MAN standing on his head sees another world than appears to those who keep their feet, but the fact has led to no serious movement for a general adoption of the inverted posture. Dressing Hamlet in modern clothing, however, has led to much splattering of ink, although it is not misdone in a generation that has tried to see how everything looks when topsy-turvy. The Hamlet experiment will not inaugurate a new theatrical habit, any more than St. Peter's will be turned into a sky-scraper. Not that the stage has escaped those moments of progress which involve drastic change. It was revolutionary when characters on the stage were made to speak the language of the street, and positively upsetting when women were cast for women's parts. These, however, were movements toward truth. Dressing Hamlet after the manner of Hart, Schaffner and Marx is not a move toward truth, any more than repainting the "Night Watch" to show billies and Colt pistols and Metropolitan Police helmets would be. Hamlet is Hamlet of his times, his physical environment as much as his mental, and cannot be torn from his setting any more than the scenes of a "Midsummer Night's Dream" can be laid at the North Pole.

But beneath the attempt to re-tailor the rather unfledged philosophy of the young prince is an idea. And that idea has nothing to do with clothes, but the endless problem of life's challenges and vicissitudes. What is struggling under the clothes is this: the feeling that it is necessary to restate the Hamlet problem in terms of today's life. It is not a new customer we need but a new Shakespeare. Not that he would insist on a Shakespeare; we could be satisfied with a playwright who wrought in soul-stuff sufficiently to show the struggle which goes on in a man under circumstances of maze and darkness. That, we take it, is the meaning of the effort to give Hamlet creased trousers and a cigaret. It may be the infantile strivings of a new appreciation of the quality which made Hamlet, and that certainly was not his costume.

## *Americans in Canada*

AMERICAN tourist travel in Canada this year is estimated by the Canadian Pacific Railroad to have been worth $136,000,000 to our northern neighbor. The Canadian Automobile Association predicts that within a few years American visitors will spend half a billion dollars every season in Canada. Two million American tourist automobiles entered Canada in 1923 as compared with less than one-third as many in 1921. Canada offers tourist attractions that are complementary rather than competitive to those of the United States and the tide of travel is facilitated by the constant decrease of border regulations, which is an excellent thing for both countries. If ever there were two nations competent to understand each other, and bound by common interest to know each other, they are the United States and Canada.

## *Wearing a Man's Name*

AS ILLUSTRATING their zeal for the further progress of the world in righteousness, certain dear ladies are fighting valiantly for the right of married women to keep their maiden names. They do not wish to sink themselves in the obscurity of any man's name. Annie Smith demands the right to be known as Annie Smith; she tramples under feet the necessity of being known as Mrs. Frank Jones, merely because of the incident of her marriage with Frank. Annie Smith she will be to the end of time, by all the gods of feminism!

Very well. No one will object.

There is only one difficulty. In shedding the burden of husbands' names, there is still the burden of fathers'. Smith was Annie's *father's* name, and the first Smith was indeed a smith, as Johnson was John's son, and Benson was Benjamin's son, and so on down the list of patronymics (*father* names).

If Annie elects to take her mother's name instead of her father's, lo, her mother's name is but her mother's *father's* name repeated!

The proposed reform seems to run itself into the ditch when pursued too far.

Ghost in Temple of Hell. If you can borrow his umbrella you will be protected from all punishment. But he always keeps his umbrella.

# The Birds Sing, But Girls "Yawl"

## At Least, This Is How It Is in Shanghai, Where They Have Also Hades on View

By MRS. L. M. CRAMER

ONE of the most interesting and amusing sights in Shanghai is to go past the race course, out Bubbling Well Road on a bright sunny morning when the horses are out for exercise, and see the dozens of bird coolies with the pet birds of their masters, holding them shoulder high in their gilded and ivory-trimmed cages, that the feathered pets may have a "look see" at the racers out for their morning's work.

There was just one thing that struck me as more amusing, and that was a pompous, silk-gowned, wealthy old banker whom I used to see all last winter about eight o'clock in the morning, with his pet bird, taking a brisk walk past my boarding house. On a rainy day he held his oiled paper umbrella over the bird's head with all the attention to its protection and comfort that a youthful American Romeo would show to the daintiest flapper, over whose head he was privileged to hold an umbrella in a rainstorm. The walk over—and it usually took about three-quarters of an hour—the banker would get into his luxuriously appointed limousine—a silver-trimmed motor car, enameled a deep purple—and be whisked away to his bank duties. But the bird never missed its outing, no matter what the weather, and no hand but its master's was allowed to take it out.

The duty of the bird coolie is to "makee catch" the grasshopper in the summer for the bird to feed upon. It is his duty to see that the bird has its bath, its house cleaned daily, and its morning walk.

In the coldest of winter weather the bird cages are covered with a close-fitting padded cover, open at the top only. Sometimes these covers are of flannel; generally, however, they are of rich silk, sometimes of a plain dark color, and sometimes of lighter shades, or of white. If white, it is usually almost covered by embroidery, the beautiful silk embroidery that Chinese women know how to make so well.

The cages themselves are hung with bits of carved ivory, the same ornaments that women back home use for pendants, strung on a cord and worn about their necks. Sometimes, too, the less expensive pieces of jade are carved and used for the embellishment of these cages.

On Tibet road, just at the end of the race course, there is a bird store. You are aware that there is a bird store in the vicinity when you are two blocks away, for the most wonderful of bird notes reach your ear. To this bird store many of the wealthy Chinese send their birds each day for singing lessons, the best singer in the store, or the singer which most appeals to the prospective subscriber, being taken into a room away from the other songsters and left with the pupil bird. At the end of the month the owner of the pupil bird is presented with a bill for music lessons, and pays it gladly. Until his bird has acquired a song which satisfies the owner, the bird lessons continue an hour each day.

Go down the winding multitudinous streets in the native city, which is the tourist's delight in Shanghai, till you come to the Willow Tea House, and there close by is a bird whose master makes a good living entirely by the songster's warbles. The bird is hung in a tree near the tea house, and other bird owners pay a stated sum each month for the privilege of hanging their own birds in the same tree.

There is a whole street in Shanghai where a specialty is made of birds. Birds of practically every shape, size and color are to be found, and their songs cover a wide range of musical notes, some also that are not so musical, as the magpie, for instance. On this street nothing is sold except birds or bird supplies. They come in every shape, color, and price. Here are to be found the best bird doctors in Shanghai, and there are a couple of up-to-date bird hospitals as well, where ailing birds of those who can afford it are sent till a cure is effected or the patient dies. Here are to be found expert bird dietitians.

Homeside birds are generally canaries, parrots and love birds. Here one sees comparatively few canaries in the homes of the Chinese though foreigners still favor them, together with the Red Lacquer Bill bird which has a song very like the canary, but which sings only at dusk in the evening or at dawn.

If there is one bird more than another that the Chinese favors it is the "Hundred Spirits Lark" from Northern China. It is this bird one generally sees out for an airing in the early morning hours, even in the coldest of Shanghai winter days. It is a large bird, about the size of a good fat robin. A native of Mongolia, it undoubtedly prefers the cold winter days to the hot ones of summer. Another favorite is the "Spectacle Thrush," so called because of the dark lines around its eyes which have the appearance of spectacles.

Beggar children—always to be found outside temples all over China.

But the bird stores, with their hundreds of warblers all in vocal motion at once, have nothing on the native schoolroom for noise. A native schoolroom is something quite different from a homeside schoolroom where Billie Jones stays twenty minutes after school because he whispers and gets

# Through the Woods

## Here Wander the Wild Life, Each in Its Own Trail; Things of Feather and Fur That Fly and Run

By JIM SMILEY

WHEN I was a boy, back in the mountains, the woods looked all alike. Just to have the dead leaves underfoot, with twigs snapping in them, and tree trunks standing all around me, and the thick canopy of leaved branches overhead satisfied my wildest dreams and hopes. I never lost my enthusiasm. The more fine points I learned the better I liked the standing timber. If I'd only known, in those early days, to find a working library of scientific books and government documents, they would have taught me to see quicker, better, and now I might be a lot more knowing. Mostly, I have had to see for myself—and a man needs so much help to see straight!

I guess the first time I really noticed the different kinds of woods was late one afternoon, when I was coming down off Ash Ridge, in Little Black Creek valley. The leaves had fallen, and the bare hardwood limbs cast hazy crisscrossing shadows on the loose rustling forest floor. Dry weather had kept the fallen foliage crisp and dry. Just before sunset, I walked into the thick evergreen swamp, mostly balsam, at the foot of the ridge. I stepped out of sunshine into dusky gloom of deep shade. I thought something had happened, it was so dark, and the air was so thick. I looked for the sun!

I turned and saw the open hardwoods were still bright, silvery and golden; the evergreens I had gone

"We simply couldn't find the deer! The ground was covered with tracks."

under were dark, shadowy, with pale balsam, rich purple spruce, and the rare green of the cone-tops. And when I began to hunt and trap, I found that it made all the difference between success and going hungry, when I knew the different kinds of forest canopy, the underbrush, and the taste of beechnuts, of roots, of twigs, of shrubs and plants. According to the kind of forest, the birds and furred animals range and live. The communities of wild life move with seasons, with ripening fruits and blossoming flowers. Rest, shelter, and food govern forest creatures.

"I want to see 'em jumping up and racing away on all sides!"

Lots of times, when I look back at the boy I was, how impudent I was in my ignorance, I laugh, or, anyhow, smile. I didn't know that in summer the deer and rabbits worked through the second growths, and around old burnings, and ran up in the hardwoods; I didn't know that during the autumn they went in beechnut years to the hardwoods, for the rich little nuts, and then in the months of driving gales and stinging cold, down into the swamps under the thick trees that do not shed their leaves in the autumn, but shelter the wild life when the blizzards whistle and roar.

If it was an off-year for beechnuts, the deer and snowshoe rabbits would not be in autumn on the open hardwoods, but along the dark sides of the hills, the north slopes, nibbling away among the lichens, or in the switch-birches, nibbling the browse, and perhaps in some little patch of a few acres of open swale, standing full of caribou-moss pawing down into the roots. I was puzzled for years by these variations.

One autumn I went in with a party of sports and woodsmen, on West Canada Indian River. We hunted up and down for four days, and saw just one deer—which seven of us missed in our great anxiety not to go longer without fresh meat! We simply couldn't find the deer! The ground was covered with tracks. We found where bucks were traveling through ridge gaps. We knew the land was just alive with them, as they say. But we didn't see any!

We hunted together, seven of us in a line, raking along ridges, sweeping sides of mountains, dragging the spruce knolls—and now and then we would see a flag away out in the forest aisles, just flickering goodby. We didn't call that seeing deer!

Naturally, I didn't think much of that kind of hunting! I want to see 'em jumping up and racing away on all sides! I reckoned they heard us and weren't so stupid as we thought. Accordingly, I went away by myself, the morning of the fifth day. I knew deer, well enough to believe they had put up a job on us—or something. I didn't still-hunt so much as I covered country, that day. I circled up to Carnahan's stillwater, climbed and traveled Spruce Lake Mountain from end to end, swung off the north side into the granite knobs and came down the other side of Belvin Flae, crossed the brook and dropping away down, crossed Indian, and cutting across the club land, hit into Metcalf valley, came up on the north side and then to avoid a high ridge circled toward Big Rock Lake, walked through some thick swamp ash, wild cranberry, and other tangled shrubs, with a scattering of gnarly water-rooted trees.

Then I heard them. Dusk had come, and no one can see much in the woods after sundown. Three rods to the right a buck jumped and rattled his horns.

"I didn't still-hunt so much as I covered country, that day."

I turned, hit my rifle barrel on three different bushes—he was gone! But two others were running—and I began to jump and twist my fool head around, rubbing my nose against the twigs and stems. I don't know how many deer I heard, but it was a lot. I had found the deer, not more than two miles from camp, all digging for roots in about five or six acres in one patch, and about thirty acres in another patch of swamp thicket. If I had science, I could tell what kind of roots they were

eating, a thick, pulpy, juicy root with a sharp, acid taste. None of the boys knew what it was, but we learned a lesson that trip!

In our country, the ground is covered with witch-hopples. I don't know who called them that. They grow about four or five feet high, with broad, fuzzy leaves. They grow in some hard-

" . . . and I began to jump and twist my fool head around . . . "

woods, and not in others. In the autumn, after all the broadleaves are down from maples, birches, beeches, those witch-hopple leaves, turned yellow, still hang on. I used to hate them for the deer and bear they saved from my rifle. I don't so much, now. They save the wild game. They are something like the scrub oak, down in Pennsylvania; and they don't grow on the north side of the Adirondacks, in the Saranac country.

A man never knows what he'll need to know in the woods about timber. Pine and spruce make the best shingles; balsam, burning slow, makes good backlogs, and balsam, stripped off the twigs for a bed of vegetable feathers full of fragrance, can't be beat; spruce poles, peeled, make the best logs for a cabin; yellow birch is our best green firewood, but the dead branches of a spruce tree start the quickest fire, and often the only fire that can be started in a soggy late autumn rain is one of birch curls and crackling spruce twigs; the best wood for a lasting fire in a camp stove on a cold February night is body beech and maple; ash makes the best snowshoe bows, and thick hemlock bark makes the hottest fire.

When one tramps along through the woods, he wonders about them. I know how I felt, the first time I ever went ashore in strange country, down the Mississippi. What I knew in the Adirondacks didn't help me a bit among the gums and cottonwoods, where the elbow tree crawled up and down like an awful snake, and the spread-butt cypress grew up in the water, and I found myself wallowing in the mud around the foot of a tupelo. No more could a swamp angel know my Adirondack woods!

I had an old chap tell me once that the only woods he could see was green timber. Course, he was a logger. They couldn't cut beech, and the other hardwoods and float them down to the sawmills. In the old days they cut just the green timber—spruce, pine, hemlock—big enough for saw logs. We have thousands, tens of thousands of acres of Adirondacks where the culled land has as good spruce as ever in the days of virgin stand. In some woods, the spruce dot the canopy, one spruce to five or six hardwoods. The stand of evergreens runs from none to an acre of clear hardwood, to ten, twenty, thirty, and on up to almost a hundred per cent dark foliage.

The spruce, hemlock and balsam—there are hardly any pines left—grow straight up. Their trunks show few knobs or forks. The branches of the spruce and balsam are slender, and often point down, right out of the parent bole. This shows where the snow, year after year, has pulled the stubborn branch down until at last it grows that way.

The scent of the woods changes as one traverses them, from mile to mile. On the hardwood ridges, the wind comes fresh from the sky, with the warmth of the sunshine, or the sting of the cold in it. Down in the heavy swamps, the levels of old lakes filled up with the wash from surrounding mountain sides,

" . . . and again to cut a green-ash shrub to brew me a drink of the bitter-yarb tea."

are dank and heavy with the oxidation of wood and the sweating of water mosses. The hunter's pitchers, full of dead insects trapped in the leaf pitfalls and drowned to feed the plants, have a breath all their own.

Sometimes I catch myself saying, "Now here's a good place for deer!" I laugh at myself, when I stop to think. On second thought, I wonder if I really know the woods as well as that? By and by I realize that I ought to know them ten times as well. This may be lying-down cover, along a ridge back, with fallen trees and thick shrubs to shelter the deer, and at noon on a sunny day, a deer would naturally be in such a place. In the mid-afternoon, they may be awakening, going down the ridges to drink in the brooks—and brooks do not flow through "good lying-down country" for deer. Generally, the deer does not feed by a brook, but out in the hardwood, or in the second growth, or in the mossy bogs.

Squirrels leave the open hardwood to eat spruce or hemlock cone meats. Come to think of it, all of us, the woods creatures, come and go according to the seasons; and in good nut years seek one kind of woods; in bad years, another kind of woods; and knowing the trees, the kind of shadows they cast, the smell of the leaves and earth—we know enough to run around some. But only just the beginning of things, after all. If we only had science!

I've lived in the woods, and outdoors, all my life, but the other day a youngster in his late twenties came along and sat down to talk to me. He told me more about trees in fifteen minutes than I'd ever known before; about the blood circulation of their sap, about the chlorine, sugar, and all kinds of things relating to how trees grow, and their flowering and the fruits of the forest.

I made some flapjacks for dinner, and when he ate some sirup on them, he exclaimed about how delicious regular homemade, March-run maple sugar was! I told him I'd just whittled a lot of shavings off hard maple sapwood, to flavor granulated sugar and water; he looked at me! For a minute he was puzzled, and then he told me the chemistry of it. At the same time, we shook hands across the bridge of science and experience. He hadn't known that way of extracting the maple flavor, any more than I knew the inside of the woods growing and expanding.

He taught me many things in the few days we were together. I, in turn, taught him the secrets of the trail and practical woodsmanship. He was an energetic young man, who had never before been in the mountains. We took many hikes on familiar trails through my forest country. Wonder added a luster to his eyes as the exercise quickened his pulse. We saw ranges of hills that he yearned to explore. Lakes splashing the landscape called to him. Frequently on our long hikes the lunch of our choice seemed woefully inadequate, though so huge when packed in the morning. A venison steak broiled on a stick, charred black to hide its rawness; a potato warmed through in the quick ashes of burning cedar. The incense of that burning cedar will remain with that youth long after the other incidents of his stay are forgotten.

" . . . he told me more about trees in fifteen minutes than I'd ever known before."

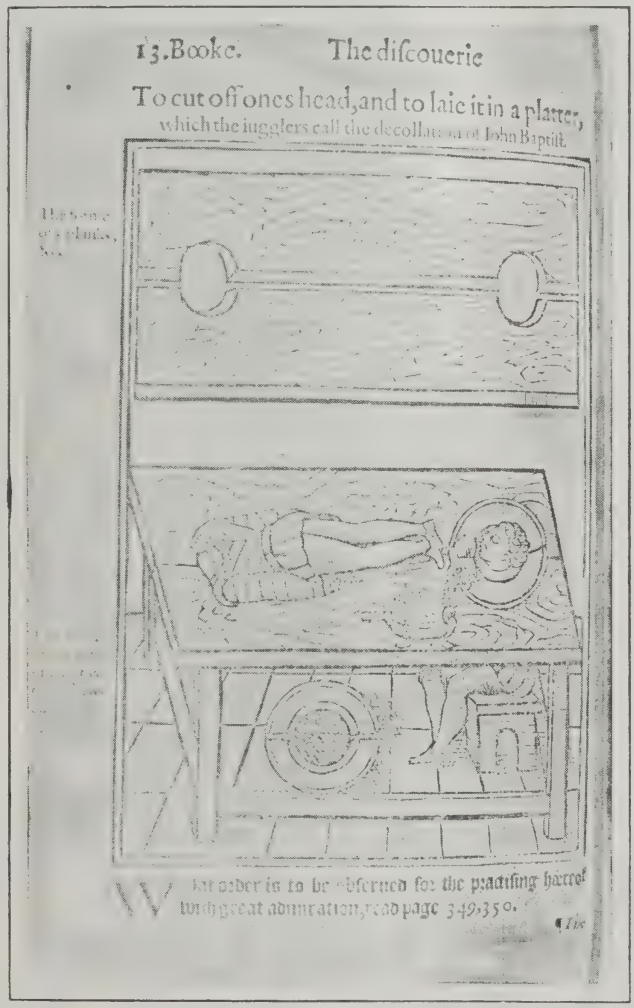
There is no other odor like it. Should he again smell its odor his thoughts will instantly revert to the days we spent together on Black Mountain. His pulse will quicken and he will in all probability seek the nearest forest sanctuary in an effort to reproduce the scenes and pleasures he experienced so long ago.

# Houdini the Book Man

(*Continued from page 2*)

famous London actor and manager is to be found even in the scene of his triumphs, London itself. The library also contains correspondence of Charles Macklin, an eccentric Irish tragedian and London theater manager, who supposedly lived to the patriarchal age of one hundred and seven years. The legend, which has reached the status of historical fact, is that Macklin's mother deserted him when he was two months old at the time of the Battle of the Boyne, 1690, when the great dispersal of the Irish race took place. Macklin was known to the theatrical profession as the first actor to represent Shylock as a human being. Until Edmund Kean appeared, Macklin bore the reputation of "here was the Jew that Shakespeare drew."

Houdini's library also contains much from the Everett Jansen Wendell collection and the collections of Augustin Daly, whose bookcase now stands in the Houdini house; the collections of Todeburg, Bement, Vail, Evans and many others. There are about two hundred and fifty thousand autographed papers in this section and more than three hundred thousand theater programs, many of historical interest, gathered from all over the world.



In the Houdini library is the portable writing desk (a mahogany boxlike affair that can be set upon a table) which was the property of Edgar Allan Poe and upon which his immortal works were written. Thomas Jefferson used a desk of this type upon which to prepare the Declaration of Independence.

But the Houdini library of magic, witchcraft and spiritualism is perhaps the greatest in the world, consisting as it does of eight complete libraries which he has bought from time to time. More than twenty thousand books and pamphlets were purchased from Symonds, the editor of the *Banner of Light*, a spiritualistic publication of Boston.

Houdini related, "I walked into Scheile's antiquarian shop in Stuttgart, Germany, and when I asked him where his magical books were, he pointed to the wall. After a glance I said, 'How much will you take for the whole stock?' and I bought four packing cases of these books."

Another typical transaction: "In Edinburgh I walked into a bookshop that was in a house built in 1700 and bought the entire stock on the fourth floor containing books and manuscripts upon spiritualism. I stayed there all day."

The greatest single addition to the magic and spiritualism section was obtained through the purchase of the library of Henry Evans Evanion, a world-famous English specialist in those fields of book collection. Other London purchases included the libraries of Hunter and of Will Goldston. The

Page from an ancient book on magic, in Houdini's library.

complete Kudarz library of Australia; the Wiljalra Frikell Library of Dresden; the Remigius Alburs library of Philadelphia, and the Hagan, Dunninger and Becker libraries of New York.

As magic and the allied arts are presumed to have been originated in the Orient, there is a special section of Chinese, Hindu and Egyptian records.

A volume bearing the quaint, but descriptive, title of *Hocus Pocus* was written in 1489 by a German monk. King James ordered that all copies of Scott's *The Discouverie of Witchcraft*, published in 1584, should be burned, but one of them is preserved in the Houdini library.

Italy has furnished the world two of its most notorious reprobates: Casanova, the international rake, and Guiseppe Balsamo, who styled himself "Count Cagliostro" and achieved a dubious reputation everywhere at endeavors that qualified him to be the patron saint of patent medicine men and beauty specialists. Houdini ranks as the most valuable single document in his possession what he believes to be the only autograph letter of this precious scoundrel who ruined a cardinal and prejudiced Marie Antoinette in the eyes of France.

The letter deals with that affair of Cagliostro's that Dumas made famous in his novel, *The Queen's Necklace*. Houdini had to purchase the entire collection of the letters of the Countess de la Motte who with her husband was implicated in the necklace bootlegging of the reckless consort of Louis XVI. Houdini often has had to purchase either whole volumes or collections to obtain a single desired document. In this manner he has acquired numerous specimens of bookbinding that in themselves are museum pieces, but his interest is in their contents, not their exteriors.

Although Houdini carries $350,000 insurance upon his library, to protect somewhat his personal investment, the real value cannot be expressed in terms of money because much of the material cannot be duplicated elsewhere. He has willed the spiritualistic and magicians' libraries, letters and documents to the National Museum in Washington. Thus the possibility of this rare material being lost to students through dispersal over the auction block has been avoided. The collection of such material is a hobby which is in a sense unique, and this adds to its value.

The recent tremendous increase in psychic phenomena and Houdini's relation thereto has given his library new interest. The devices employed by pseudo-psychologists and spiritualists either are those long since known to stage magicians or are adaptations of them. Houdini

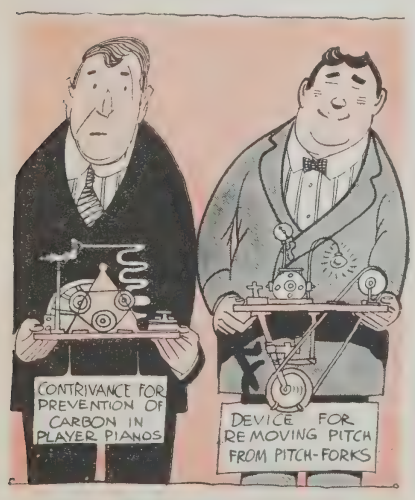
# PATENTS THAT WERE THAN USEF

By

## S. R. WINTERS

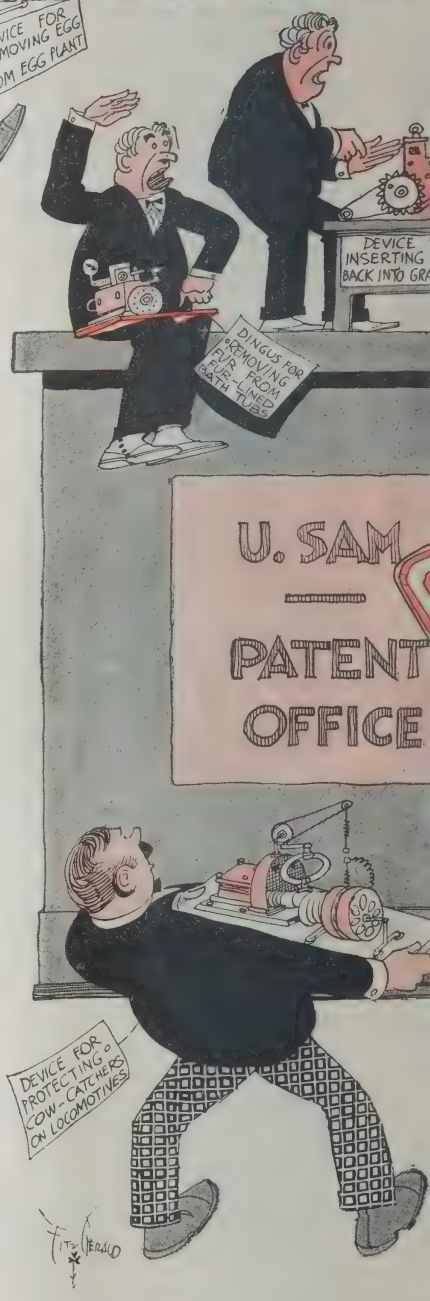


ILLUSTRATED BY W. O. FITZGERALD

SINCE the first patent was issued to the Earl of Worcester, in 1660, for the invention of a steam engine—described as "a stupendous or water-commanding engine"—the United States Patent Office has granted more than 1,500,000 patents. The inventions thus covered—including the internal combustion engine, telegraph, radio, telephone, automobile, and airplane—have completely revolutionized our mode of living. It may be said that they have changed the destinies of nations.

Against the background of these useful devices and mechanical improvements may be found thousands of utterly worthless patents. These are not only without value but they are ridiculous contraptions. Their intents and purposes, when seriously expressed, constitute monstrous jokes. When considered in the light of practical applications, these freak patents are such "screaming" comics that they place George McManus and Bud Fisher in the rôle of tragedians.

The proverbial lamb and lion lie down together, if this metaphor is permissible, when inventors combine a safety watch pocket and roach trap, hook up a rocking chair with a vacuum cleaner, or construct a plow and a gun on the same beam. Why the invention of a "bubble hat," so called, whereby soap bubbles are produced, unless the owner of such a headpiece desires, to reverse the conventionality of tipping his hat and spray soap suds instead? By a patent issued in 1891, there is a strange juxtaposition of a cuspidor and a toy. There has been invented an electric flytrap, whereby flies are lured by an enticing bait and their heads chopped off—a sort of formal electrocution. Turkeys and chickens are frequently represented as being placed on the chopping block, but a patent has been issued for protecting the eyes of poultry instead of their necks.



When two inventors in Waterloo, New York, combined a plow and gun, in 1862, they must have anticipated a repetition of the celebrated call to arms of the farmers by Paul Revere.

By means of this device the farmers could have carried their plows and guns with them instead of leaving the plows in the fields to answer the call to armed combat. This combination—gun and plow—when loaded with blank shells would probably have a present-day utility value in spurring the activities of a slothful or lazy mule. The joint inventors tell us that, "Its utility as an implement of this twofold capacity is unquestionable, especially when used in border localities, subject to savage feuds and guerrilla warfare. As a means of defense in repelling surprises and skirmishing attacks on those engaged in a peaceful avocation it is unrivaled, as it can be immediately brought into action by disengaging the team, and in times of danger may be used in the field, ready charged with its deadly missiles of ball or grape. The share (meaning plowshare) serves to anchor it firmly in the ground and enables it to resist the recoil, while the hand levers (the plow handles) furnish convenient means of giving it the proper direction."

Producing rain by artificial means, which is not practical according to the United States Weather Bureau, is not a recent proposal, as we are inclined to believe. As long ago as July 13, 1880, D. Ruggles, of Fredericksburg, Virginia, had a weird conception of prematurely robbing clouds of their moisture. He proposed to dispatch into the clouds one or more balloons, equipped with torpedoes and cartridges which would explode. The very explosions would, according to the inventor, cause a concussion (a brainstorm of the clouds, maybe) and the shock would produce rainfall. The inventor defined the objects of his scheme as that of refreshing the arid crops of farmers as well as that of purifying the atmosphere as a prevention of pestilence and epidemics.

One of the earliest patents issued bears the somber description, "life-preserving coffin in doubtful cases of death." In instances where persons were committed to coffins, this invention would make it possible for the slightest motion of either the head or hand, acting upon a system of levers, to cause the instantaneous opening of the lid of a coffin. The spring catch, which opens the coffin, is designed to be attached to the subject supposed to be dead by means of a rod and ring, the latter slipped on the finger of the person. Comedy and tragedy are subtly combined in the closing paragraph of the patent papers: "It is intended to place the above described coffin, with its

inmate, in a vault, with a key of the vault deposited inside of its entrance, until decomposition takes place, so that should the person not really be dead, life may be preserved."

If you own a Maltese cat or other member of the feline family and it is suffering with laziness, it may be well to take advantage of an invention described as an "Exerciser for Felines." The fondness of cats for catnip is capitalized in this freak invention, for which a patent was granted in 1907. It consists of a ball-like chamber in which is placed catnip, and with the odor of catnip coming from small openings in this device, it is presumed that a cat will work and play with this ball until it gets the "much-needed exercise."

The professional "corn doctor" would have long since become obsolete had the efficacy of a "Corn-Remover," invented by a soap-manufacturer of Germany, been proved. This device, cruel enough it would seem, simply grinds the corn away from your little toe by means of a sandstone. Similar to the grinding of an ax, this rotating grinding block is applied to the corn on your foot and the handle is turned until, by wearing-away or abrasive method, the corn is removed. The use of sandstone to the contrary, the inventor claims that "the object of my invention is to effect the removal of corns and other excrescences in a painless manner and free from danger."

The persistent setting hen which is frequently stoned and otherwise abused as a means of keeping her away from the nest egg, is the subject of a patent issued in 1917. This device consists of placing strips of sheet metal around the legs of a hen so that she cannot bend them when she attempts to be seated on a nest. The pieces of metal are locked around the limbs of the hen and until they are unlocked it qualifies under the patent name, "Device for Preventing Hens from Setting."

A "Device for Preventing Snoring" may sound like a travesty upon the victim and a blessing to persons who are annoyed by the snorings of others. Probably George A. Foster, of Chicago, Illinois, was a complainant, prompting him to obtain such a patent. The diagram illustrating this patent appears to indicate that it is necessary to smother a person to prevent snoring. The inventor admits that as a means of avoiding snoring it is necessary that the mouth and lips be closed tightly; therefore, he conceived the patentable idea of buckling a piece of cloth or bandage securely over the mouth and chin. Furthermore, a rubber lining covers the mouth as a means of securely fastening the lips. Straps across the top of the head and around the neck complete the smothering process, all of which might warrant interference with its use by the Society for the Prevention of Cruelty to Animals. Yet, the inventor claims that this device may be worn without discomfort.

Obviously designed as a labor-saving device whereby the housewife may repose comfortably in a rocking-chair and operate a vacuum cleaner at the same time, a patent, issued in 1911, is described as a "Rocking-Chair Attachment." By means of this arrangement, according to the inventor, all that is necessary to sweep or clean a home is to operate the rocking-chair. The latter, however, would represent a complicated mechanism when you attach a cylinder, a bowl, a diaphragm, rods, and other units required to operate the vacuum cleaner. Furthermore, the seat of the rocking-chair is made detachable so that the cylinder and operating parts of the vacuum cleaner are readily accessible.

The wildest flights of imagination of a Jules Verne would seem incapable of conceiving of the use of a bird in guiding a balloon aloft. And, yet, a patent was granted to Richard Wulff, of Paris, whereby he would attach a living eagle or buzzard to a balloon for the purpose of propelling and guiding the latter. This ridiculous contraption is labeled, in the patent papers, with the modest title, "Means and Apparatus for Propelling and Guiding Balloons." The patentee actually proposed the displacement of motors on aircraft "by a living motor or motors taken from the flying class of birds—such as, for example, one or more eagles, vultures, condors, and so on. By means of suitable arrangements

(clearly shown in the annexed diagrams) all the qualities and powers given by nature to these most perfect kinds of birds may be completely utilized." It was specified that the eagles or buzzards thus employed would be put in harness or corsets, leaving their wings unfettered.

Other freakish patents issued during the past 265 years include the following: A process for removing tapeworms by means of a baited trap; figure of a cat covered with illuminating paint and perfumed with oil of peppermint as a fright to rats; device for inducing sleep by applying pressure to the arteries and veins of the neck; composition for pacifying the waves of the sea; hat removable by mechanism on the inside without using the hands; device for shaving by abrasion; bait to lure and then automatic belling of rats; device for preventing holdups on trains by using jets of steam; device for prolonging sleep; mechanical arrangement for teaching natural theology; the combination of a scarecrow and advertising scheme; a probe and electric current for testing the nerve of an aching tooth; method of destroying aircraft by a light to lure and then exploding bombs; hat ventilated to avoid sunstroke; mechanical appliances for teaching facts of immortality; beauty mark in the form of a court plaster adorned with a sparkling stone; combination knife, fork, spoon, and toothpick; a helmet with a gun to be operated by the mouth; display apparatus for imitating a hen laying; pencil, penholder and like articles with a deterrent substance in a groove to prevent one from biting it; a corpse hermetically incased within a block of transparent glass; device for producing dimples; beheading clock and ax for theatrical purposes; device for lowering keys from a window cover for photograph of deceased; a potato bug catcher which includes a parachute and padded shoes; rat-proof building which consists of a stone foundation, excavation filled with gravel, and a tube in which to catch rats.

According to records, patent for a perpetual motion machine was issued to the Marquis of Worcester as early as 1665. Now, however, perpetual motion machines are not numerously classed among the freak patents because the United States Patent Office requires each claimant to such a discovery to produce a working model. This request is not complied with. Some criticism has been lodged against the Patent Office for granting patents covering ridiculous and worthless contraptions, many of which are of such vulgar aspects as to forbid mentioning in print. The defense of this branch of the Federal Government is to effect that its duties do not specify that patent examiners determine the intrinsic value of inventions—rather the point raised is the device novel or new and is it patentable. Meanwhile the list of freak patents is cumulative.

# Note the Names of Our Criminals

(*Concluded from page 3*)

in violation of law is morally responsible for every crime incidental to the making possible of it for him to drink.

If bootleggers commit perjury it is for the drinker that they perjure themselves.

If now and then they shoot an officer who is upon their heels, it is because the drinker is waiting for his drink that they shoot.

If Mrs. Cook, the temperance woman who was assassinated in her little home in Iowa was, as charged, shot down by a bootlegger, he shot only to maintain the continuity of alcoholic supply that his customers demanded.

Every drink is tainted with the crimes that were committed to deliver it, or that may be committed to continue the supply.

I am quite sure that the people who are doing the drinking these days have not thought this thing out. But their bootlegger servants are acting it out. The drink, the bullet, the dead policeman, the widow, the orphans—the first is the cause, all the others the effects of it. The bootlegger who becomes rich, turns gangster and heads a great gang—who gave him his start by becoming his customer? The responsibility of drinkers is very great. As they awaken to it, they cease to drink. It is not worth while. It is better to be able to sleep nights.

Foreigners who want money more than anything else note that some of the "best people" in America do not scruple to violate the prohibition law. Is it any wonder that these strangers have no respect for law? Is it any wonder that so many of them first become bootleggers? After night-driving and shooting all along and across the Canadian border, is it any wonder that they become hijackers and bank robbers? Is it any wonder that many decent American boys have come to believe that law does not amount to much? Drinkers are not only making criminals today, but they are preparing more crimes for the next generation.

***The War Was Not the Cause of Crime Wave***

*It is nonsense to say that soldiers became so accustomed to bloodshed during the war that life means little to them and that the war is the cause of the present outbreak of violent crime committed for plunder.* These crimes are, for the most part, committed by boys and men ranging in age from 17 to 23 years. Those who are 17 now were only 10 when the war ended and therefore saw no bloodshed. Those who are 23 now were only 16 when the war ended.

*Most of the great criminals of today either came here from abroad or were born here of foreign parents.* For years we let everybody in who had the money to get across. Some foreign nations shipped their criminals to us as the easiest way of getting rid of them. We took whatever the wind blew us and now the dust is getting into our eyes.

There are certainly a great number of other reasons for crime, but they are probably relatively unimportant. The practical thing to consider is, What are we going to do about it?

Well, the drinkers can stop drinking. That will help a little.

It also goes without saying that conviction of crime should be followed by the legally prescribed penalty. And it should be made possible to convict the guilty. Existing court practices protect the criminal better than they do the public. Conviction of the guilty should be as quick as we can make it, as certain as everything else except death and taxes, and the penalty, whatever it may be, should follow in short order.

***Every Criminal Thinks He Can Get Away***

The mere housing of the modern criminal is a very expensive thing. I was recently surprised to hear Governor Smith, of New York, say that if one wants to know how large a prison he can build for a million dollars, all he has to do is to divide a million by three thousand. Three thousand dollars is a good deal to pay for housing a criminal, to say nothing of keeping him. I do not know why they should not be put on a farm and made to work under cover of machine guns.

It is unpleasant even to think of lashing human beings. I have never until now been able to think of such a thing. Even now I should oppose the lashing of anybody except one who had wantonly gone out to rob and who, in order to rob, had killed. If it is unpleasant to think of lashing murderous robbers, it is also unpleasant to read of men shot down in their tracks merely because they happened to be carrying some money that the murderers wanted. What are we going to do? If the death penalty were sufficient there would not be so many murders in New York and Chicago. Of course, the laws are not enforced as they should be. Every criminal thinks he can get away. They might feel the same way toward the lash. Perhaps it would do no good.

Yet something has got to do good. A war is in progress between those who rob and murder and those who do not. One side or the other is going to win the war. Normal conditions are going to be restored. The murderers are not going to win. We shall do whatever we have to do to make this country a safer place in which to live.

But wise gentlemen in Europe, who are bemoaning the decadence of the American people, would do well to scan the names of those who are giving us a bad name.

# "The Scarlet Letter," How It Was Written

(*Continued from page 5*)

for twelve years. What was he doing? He was reading and writing, or learning how to write; and he was doing a great deal of independent thinking. The latter might almost be called a peculiarity; independent thinking has never been common. It was perhaps less uncommon in the early part of the last century than it is now, when "civilization" does our thinking for us: Emerson was a thinker, Channing, and a few more: dreamers and Utopians; but the practical man had hardly yet appeared, and the practical man thinks from hand to mouth, as it were, and the debt he may owe to the Utopians and dreamers is unconsidered. My father was neither a dreamer nor a Utopian, but he meditated upon human nature, the world, and the Creator; and some of his results may be found in his short pieces, seldom read nowadays, nor their significance apprehended; some of them would be found to be startlingly radical even by our contemporary industrious Free-Thoughters. But he seldom allowed these speculations to get into his novels.

***A Group of Hermits Under One Roof***

For a long time, little that he wrote was to his own satisfaction: most of his manuscripts he burned; those that he sent to periodicals appeared without his name—he had a variety of pseudonyms: he would imagine a character and write in it. Whether this be a wise practice, I will not decide; it is not an unwisdom to which many present-day authors are addicted.

After his twelve years, he met the woman whom he married—first essaying the Brook Farm community, with the idea that it might prove suitable for his married life, and making up his mind that it wouldn't. That experience, at all events, could hardly be termed a plunge into society; it was a group of hermits under one roof. Thoreau might have felt lonesome there.

He took his wife to Concord, which was Emerson and not much else, and though my father and Emerson liked each other, their minds didn't collaborate: Emerson would drop in to remark that "The Muses are in the woods today"; and my father would excuse himself to attend to the boiling of the beef and cabbages. At other times he would be upstairs writing *The Mosses From an Old Manse*. But there was really no money in it, and the custom house became imperative. And there, at last, being more than forty years old, he met and dealt with all sorts and conditions of men, took their measure and gave them his. By all accounts, he made a good job of it; the latent regions of his nature were aroused and went to work: the life of imagination in which he had hitherto dwelt was changed for a life of facts and acts; he realized himself and acquired confidence in what he discovered of that personage. He wasn't weaned from the desire to write, but he had no opportunity to do it, and that no doubt strengthened the desire.

***When Hawthorne Lost His Job at the Customs***

Accordingly, the man who sat down in the attic in Mall street to write *The Scarlet Letter* wasn't the same man who had written *Twice Told Tales* in Union street, or *Mosses From an Old Manse* in the Old Manse itself in Concord. He was mature, a man of the world. He had his imagination in its full strength, however, and an even finer spiritual insight, deepened by the experience which a true marriage bestows. The moment for a masterpiece couldn't have been more opportune. But other elements, apparently less favorable, were to enter into the situation.

In the first place, he had just been politically decapitated; and as he himself remarked, the beheading of a man is seldom the most agreeable episode of his existence. Nor is his plight improved if his pockets happen at that juncture to be empty. Empty my father's were, so far as he was aware, for his removal from office had been unexpected and he had made no provision against it. But here, his wife came to his succor; she was not only a good practical housekeeper, but a foreseeing one, and instead of breaking down when he made the announcement of his mishap, she opened her private drawer and produced a bundle of her economies to the amount of three hundred dollars, riches sufficient to keep the ménage going for six months at least.—"So now," she said, with a radiant smile, "you can write that romance!" For he had admitted, in their matrimonial confidences, that a story was rumbling in his mind to which business prevented his giving an airing.

***When the Great Book Was Being Written***

There were the chair and table in the attic seclusion, too, and the little mahogany desk, with quill pens and paper; and she had made for him an oriental dressing gown to write in and had even affixed inside the left-hand skirt of it a little flannel butterfly to serve as penwiper, at the precise spot where she had observed that it was his slovenly habit to wipe his pen during the throes of composition. So now all that the new romance needed for its realization was the mere writing of it.

So far, well; but now troubles began. While the father was having *The Scarlet Letter* fever upstairs, the children caught plain scarlet fever below. But fortunately my mother was a homeopathist of the true "high-dilutionist" type, and my sister Una and I came to the conflict with a clean bill of health in reserve. Our siege was light, inasmuch as on a day when some friend of the family was driving down street in his gig, and called out to the two small people who paraded in the sun in front of the Mall street house, "Ah, youngsters, how are you?" we replied proudly, "Oh, we've got the scarlet fever!" So that was that.

But that was not all. Not to mention minor matters, my father himself met with the unusual bad luck of a neuralgic affliction which settled in his right ear; few things could be less conducive to communion with the Muse. He endured it with sublime patience, and it passed: but the really serious trouble was the grave turn taken by his mother's illness, against which even homeopathic remedies strove in vain. She had attained what in those days was held to be old age, and the end was manifestly inevitable, and not far distant. The room in which she lay was directly underneath the one in which her son was writing, and the open doors made all that went on there audible to him.

***Creating the Soul of "The Scarlet Letter"***

Samuel Johnson wrote his romance *Rasselas* to get money to pay for his mother's funeral. The parallel was close: genius is not defeated by the blows of fate, but rises stronger under them. Assuredly *The Scarlet Letter* was not weakened by the brooding tragedy; on the other hand it may have enabled the writer to search profounder depths of the human heart, guided by his own sorrow. That organ-tone which I spoke of just now must have gained added solemnity under those gates of death; the meaning of life past would become clear, and the tender memories of things not fully understood and valued till nevermore was spoken. No great work can be done but the life of the doer must go into it: it is the price of greatness. And it is in the deepest chambers of the human heart that the surest fellowship is found—the roots of human brotherhood.

The emotion begotten of his mother's passing vibrated through the pages of my father's book, a sad but purifying and exalting influence. It unveiled the souls of the characters in his story, and they became not only individual but typical, so that every reader could see in them his or her own secret, actual or potential; and for years after the book was published, sad and anxious pilgrims came to his door and—for he never refused them—would be closeted with him for an hour, and go away comforted or enlightened; and what was said in those confessionals was never revealed, even to the author's wife.

He would emerge silent, grave and pale.

There was another element in this period of the writing of *The Scarlet Letter* that must not be omitted. My sister and I were of an age to know without comprehending what was going on in the death chamber, and we had the imitative and dramatic instinct common to our years—the minuteness of observation which misses no detail, and the impulse to depict and express which goes with it. We were occasionally allowed to make tiptoe visits to our grandmother's bedside; we knew she was undergoing some mysterious experience which called for tenderness and sympathy in the bystanders; but of death we had no conception, though the word might be spoken. The hush and dimness of the room impressed us; but it was all a sort of play to us, the end of which must somehow be happy.

Accordingly, we could not fail to rehearse the scene (often in our father's presence) and with a fidelity to fact so harrowing as at once to wring his heart and to tempt a smile. He noted some of these appalling though innocent parodies in his journal; how first one and then the other child would impersonate the invalid, the doctor entering with his medicines and directions, the ceremony of the pulse, the conference outside the room afterward. It was a page of life which has never found its way into literature; the comedy is interwoven too intimately with the tragedy; but we doubtless witness its effect on my father in his portrayal of the nature of the child, Pearl, in the story. She too harrows her mother's soul with her games, her questions, her moods and her prattle, which sometimes seem to suggest a poignant and dismaying intuition of the truth—whether that truth be death or sin.

Reviewing the circumstances attending the composition of the book, it is small wonder then that it has not been rivaled in its own field. But neither has any other writer attempted to echo the viewpoint of the story by other methods, although, of course, the sin of *The Scarlet Letter* is among the most familiar materials for fiction. But the writer was unique in omitting all details of the sin itself—upon which other novelists depend for the main interest of their narrative—and confining himself to its results upon the souls of the *dramatis personae*. What he wrote is a masterpiece, but perhaps even more masterly is his forbearance to write the rest.

It was obvious enough after the event, indeed, that to this forbearance is due the perennial fascination of the book; none of the innumerable tales of illicit passion written before or since has so well succeeded in holding the deeper attention of the world. After skill has done its best, there remains a certain vulgarity in their presentation, and vulgarity can never attain immortality in art, however indestructible it may be in real life. But the sufferings and vicissitudes of the spirit have dignity, and their importance is not transient. Being in a sphere above the actual, they achieve a sort of universal significance which everyone may appropriate to his own peculiar need.

The manifest ease with which a "First Part" of *The Scarlet Letter* might have been written, however, and the interest such a preamble would possess for the ordinary reader, were not long in stirring the sensibilities of writers of drama, and of actors; they thought that the success of *The Scarlet Letter* as a book assured an even greater triumph on the stage; and many were the suggestions to that effect made to Hawthorne.—Give us the scenes in England, the old ancestral mansion in which Hester was born, her growth to young womanhood, her beauty, her ambitious thoughts, the appearance of the elderly scholar, Chillingworth, wealthy and solitary; his love for her, and her consent to a marriage, not for love of him, but because it would bring her out into the world she had dreamed of. Many moving and picturesque scenes there! Then the journey to Holland, and her prolonged stay there while her husband went on to prepare in advance their home in the American Colonies.—Here is no slackening of interest; and now comes the eloquent and captivating young minister, Dimmesdale, her true mate, and their irresistible fascination for each other. Her charm overwhelms him, and she in her turn surrenders. They make the long voyage to Boston in the same ship; what passion! what dismay when her approaching motherhood is revealed! After that, we may take up the story as written and carry it swiftly to the end!

It was an attractive and promising outline; the trouble was that my father could not be induced to fill it in, and that nobody else was adventurous enough to match style of treatment and dialog against his. The First Part must then be given up; but might it not be possible to make a play out of the story as it stood? The judgment of the writer of *The Scarlet Letter* was in the negative; he was inclined to think, however, that the story might be done over as an opera. This seems probable; but there happened to be no Beethoven at hand to carry out the suggestion.

"Salem Harbor," as seen from window of Hawthorne's office in custom house.

Years after my father's death, Richard Mansfield appeared in New York in a stage version of the story, but it was not successful, in spite of the talents of the actor; and the part of Pearl will always be of almost insurmountable difficulty. I believe one or two other attempts were made with no better result.

When Irving and Ellen Terry came to America to offer their united genius to our public, I happened to be standing with them behind the lowered curtain between two acts of *As You Like It*. The lovely actress, glowing from her part, appealed to me to dramatize *The Scarlet Letter*.

"I've always so longed to try Hester, and I believe I could do it! It's one of the greatest parts in the world: and what a Dimmesdale Henry would make!"

Henry Irving agreed: "It would be one of the most powerful things on the stage."

It was a temptation: but I told them why it was impossible, and they finally assented—Henry did at least; but Ellen, as the bell sounded, sighed, "Oh, but that scene beside the brook, and her deep whisper (Concluded on page 21)

# Is New York No Longer American?

The following letter, written by a traveler, presents a view of New York which is worth considering.

—New York City.

Dear Sir:

"New York City is on the downgrade and if you ever liked it you had better prepare yourself to change your opinion, for no real American can like New York City as she is at the present time."

Thus spoke a fellow-passenger to me just before we landed (from Europe) last Sunday morning.

My four and a half days in New York confirms everything my companion said about present-day Gotham. Although my stay in Europe has not been so very long I am absolutely amazed at the changes which have been taking place here. In London, of course, it has been recognized for quite some time that New York City is no longer Anglo-Saxon. And both in Paris and in London American friends have emphasized New York's growing alienism. But still I expected to find here at least a strata of Americanism and the newspapers fighting to make "the melting-pot" just what its name implies.

But instead of that I find the newspapers here more alien and more anti-American than they were in 1920 and a very real diminution of the Anglo-Saxon population.

And the changed character of New York's citizenry is reflected in the physical appearance of the city. There isn't a city in Western Europe that would tolerate for one instant the filthy condition of New York's streets and public parks and there isn't another community in the world that would put up with such a filthy press as exists here. Verily, I believe more than ever in the truth of the old proverb, "Whom the gods would destroy they first make mad," for there doesn't seem to be a single organ of publicity here which concerns itself with remedying the frightful conditions now existing. Instead the newspapers publish trashy articles dealing with scandals of the underworld or spit their hate in editorials against the Nordic race and "one hundred per cent" Americans. Graft and greed and sordid publicity seem to be the order of the day here and there is no intelligent criticism on how to make New York City more fit for human habitation

What the ultimate result of this campaign of hate and salaciousness will be no one can tell, but I predict that unless New York City is very careful she will lose her population supremacy even as she has already lost the moral leadership of America. New York's geographical situation will not save her from decadence if she lets herself become an unfit place for the best type of Americans to live. If the aliens here, through their controlled newspapers, really succeed in driving the Anglo-Saxons elsewhere, then New York's decline is absolutely assured. There is very good evidence that the old-time New Yorker, the New Yorker of American antecedents, is drifting away. In fact, few of the sons and grandsons of the men who first built up New York's greatness are living in this state and with their going has come a steady diminution in the number of emigrants from other sections of the United States to New York.

My friend of the boat stated that in his opinion it would take only the departure of one hundred thousand more Anglo-Saxons from New York City to doom this city to complete foreign control and while I am not quite so pessimistic as that I still think New York's future is on the lap of the gods.

In closing I want to say that I have so much confidence in the AMERICANISM of the West and Pacific Coast, so deep a belief in the American people, that I am not discouraged over the future of this country because New York City has not fulfilled the expectations of her forefathers. New York City has failed America because she is no longer American. She may have a chance to come back yet but she will have to change her present tune and make her city fit to harbor American families. Otherwise her steady decline is absolutely assured.

Yours truly,

M———— A————

## "The Scarlet Letter," How It Was Written

(*Concluded from page 20*)

—'Thou shalt not go alone!'" And I have often thought of it since then, and Ellen will always be associated with Hester in my mind. But I remember, too, the little poem that Longfellow wrote on the occasion of my father's funeral:

"Ah, who shall lift that wand of magic power
Or the lost clue regain?
The unfinished window in Aladdin's Tower
Unfinished must remain!"

The mystery and complications of sex enter into none other of my father's writings; he dealt with it once and for all, and after his own fashion. The mention in the introductory essay on *The Custom House*, of finding in the attic of the building an embroidered letter "A," is a bit of fancy on his part; no such thing ever, so far as we know, existed. It was engendered in his imagination from his conception of the character of Hester, just as was the undefined horror on the breast of Dimmesdale. Hester's fine needlework as applied to that emblem was a concrete sign of the preoccupation of her mind with the penalty of human law upon her sin. That penalty failed of its office as purposed by her judges, though a higher end was accomplished by it. The lesson is spiritualized, and the whole story ascends with it into the spiritual realm.

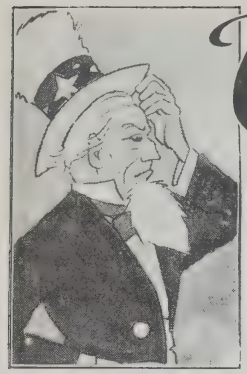
That was a flippant rejoinder that I made to the letter which the lady wrote me; perhaps this little essay may make some amends. But her ascription had struck me as so preposterous that my spontaneous reaction was a jest. Neither I nor anyone was capable of Nathaniel Hawthorne's work; he could not have paralleled it himself. It arose out of an unprecedented combination of circumstances rare intrinsically; the lines of Emerson come to my mind, when he speaks of the semi-miraculous works of Phidias and Michael Angelo—

"The passive master lent his hand
To the vast Soul that o'er him planned."

Works of art really great resist analysis; even their makers cannot account for them, or repeat them. They belong, in part at least, to a category other than ours; and they are still fresh and new after long periods, because they are concerned with permanent truths of our nature.

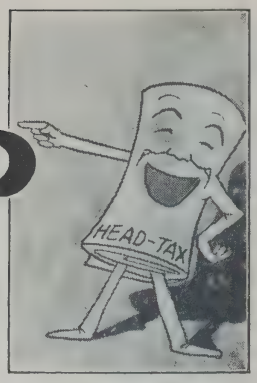
*For Tough Beards or Tender Skins*

YOU will find relief and comfort in a jar of Ingram's Therapeutic Shaving Cream. It rapidly softens the toughest beard and prevents shaving irritation. Its exclusive properties soothe and cool the skin and heal troublesome little cuts. It leaves your skin soft, cool, invigorated and refreshed.



Thousands of men have told us that it makes shaving a pleasure—no longer a job to be dreaded.

If your druggist cannot supply you, send 50c. for the blue jar that contains six months of shaving comfort. Or send 2c. stamp for sample.



Frederick F. Ingram Co.
*Established 1885*
17 Tenth St.,
Detroit, Mich.
Also Windsor, Canada

*Made particularly for tender skins*

# Where Does the Head-Tax Go?

## Why Does It Not Serve Its Legal Purpose?

By MARIAN K. CLARK

Formerly Chief Investigator, New York State Department of Labor, Bureau of Industries and Immigration.

NEW YORK STATE has had a valid claim against the Federal Government for the support of alien patients in the civil institutions of the state since the passage of the Act of 1882. The state hospitals prepared in all some 31,861 claims against the Federal Government amounting to $17,247,-616.71 and the attorney-general was authorized to present the matter to Congress. Then followed a change of administration and no further action was taken.

In October, 1923, the Interstate Conference on Immigration convened at New York City for the purpose of reviving the subject. This conference was attended by delegates from the states of California, Connecticut, Illinois, Maryland, Massachusetts, New Jersey, New York, Pennsylvania, Rhode Island, and Washington.

The great burden of the alien insane falls more heavily upon New York than any other state, and it is increasing rather than diminishing. The average period of hospital residence of the foreign-born insane is 9.85 years, practically ten years of care for each patient. It costs approximately $425 per capita per year for care, therefore the average alien patient in the state hospitals represents a loss of nearly $4,000 to the taxpayers of the state.

The law was violated in two points: first, through admitting mandatorily excludable aliens; second, by diverting the head tax, contrary to the supreme court decision upon which the constitutionality of the levy was based. This diversion continues irrespective of the fact that the indebtedness of the Federal Government has been clearly established.

The records will show that, during years of heavy immigration, immigrants were frequently passed through Ellis Island at the rate of twelve hundred a day. The medical examiners at the station, although competent, were utterly unable to give any mental or physical test of value in *a rush examination of ten, twelve or fourteen immigrants a minute.* The excuse of the Federal officials for the existence of these conditions has invariably been that "Congress has refused to grant a sufficient appropriation with which to increase the force of medical examiners."

Immigration officials will state that these conditions no longer exist, that all of this inefficiency has been changed, and the admissions at Ellis Island at the present time do not exceed an average of 300 a day. This is no doubt true as of today, and as the result of the new quota law, *but the problems of the state hospitals are not the product of today, but the residue of other years and the consequences of other conditions.*

The state hospitals in New York State, as a result of mistakes in previous years, are now caring for more than ten thousand alien insane at a cost of $4,500,000 a year, and the state administration asks for $50,000,-000 more for the extension of hospital accommodations.

*What has the Head Tax to do about it?* Much, as the reader will see.

On August 3, 1882, the original act regulating the national control of immigration was passed by Congress, of which Section 1 provides as follows:

AN ACT TO REGULATE IMMIGRATION.

"Be it enacted by the Senate and House of Representatives of the United States of American Congress assembled. That there shall be levied, collected and paid a duty of fifty cents for each and every passenger not a citizen of the United States who shall come by steam or sail vessel from any foreign port to any port within the United States. The said duty shall be paid to the Collector of Customs of the port to which the passenger shall come, or if there be no collector at such port, then to the collector of customs nearest thereto, by the master, owner, agent, or consignee of such vessel, within twenty-four hours after the entry thereof into such port.

**"The money thus collected shall be paid into the United States Treasury and shall constitute a fund to be called the 'Immigrant Fund' and shall be used under the direction of the Secretary of Labor to defray the expense of regulating immigration under this act and for the care of immigrants arriving in the United States, for the relief of such as are in distress, and for the general purposes and expenses of carrying this act into effect.**

"The duty imposed by this Section shall be a lien upon the vessel which shall bring such passengers into the United States, and shall be a debt in favor of the United States against the owner or owners of such vessels, and the payment of such duty may be enforced by any legal or equitable remedy; Provided, that no greater sum shall be expended for the purposes hereinbefore mentioned, at any port, than shall have been collected at that port."

The constitutionality of this Section was promptly assailed but in upholding the above provisions of the levy, the United States Supreme Court, in December, 1884, in its decision of the "Head-Money" cases (112 U. S. 580) pointed out:

"If it were necessary to prove that the imposition of this contribution on owners of ships is made for the general welfare of the United States, it would be difficult to show that it is so . . . . The money thus raised, though paid into the Treasury, **is appropriated in advance to the uses of the Statute and does not go to the general purposes of government. It constitutes a fund,** raised from those who are engaged in the transportation of these passengers and who make a profit out of it, for the temporary care of the passengers whom they bring among us and **for the protection of the citizens among whom they are landed.**

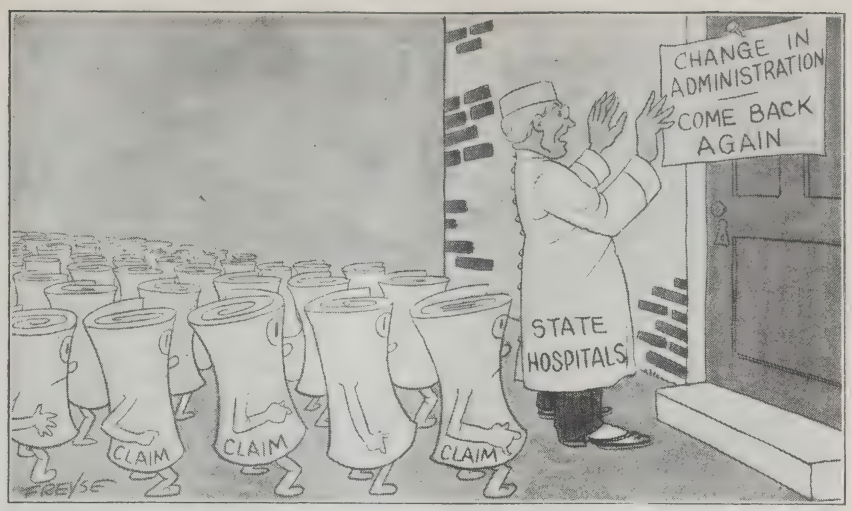
During the eight succeeding years after the passage of this act from 1882 until 1890, the actual regulation of immigration by the New York State authorities under the jurisdiction of the Federal Government, and, empowered by Section 1 of that act, *the Secretary of the Treasury contracted with New York State officials and authorized them to receive all aliens and to relieve and to*

*support those who might "fall into distress" or require public aid.*

By the Sundry Civil Appropriation Act of August 18, 1894 (28 Stat. 392), the Head Tax was increased to $1.

By the Immigration Act of March 3, 1903 (32 Stat. 1213), the Head Tax was increased to $2.

By the act of February 20, 1907, the Federal Government assumed jurisdiction over the admission of aliens, the determination of classes to be excluded and the regulation of all matters affecting aliens until they are released from immigration stations, after which they become solely a state charge and problem. By this act the Head Tax was increased to $4 (34 Stat. 898).



By the Immigration Act of February 5, 1917, the Head Tax was again increased to $8.

It is apparent, therefore, that a very considerable revenue was derived from this source during the years of heavy immigration. An inquiry addressed some years ago to the Commissioner General of Immigration elicited the information that the fund existed as a "*paper fund.*" The pertinent inquiry is then suggested: what disposition has been made of the "*actual fund*," the moneys of which were "*appropriated in advance*" by the statute?

Since the Head-Money Decision has never been reversed, any act purporting to abolish the Immigrant Fund or reappropriate the proceeds thereof must itself be unconstitutional.

The only clause in the Appropriation Act that in any manner refers to the Immigrant Fund, under caption "Public Health Service" (35 Stat. L 963) provides as follows:

> ". . . in all, one million two hundred and sixty-five thousand, seven hundred and fifty dollars, which shall include the amount necessary for the medical inspection of aliens, as required by the Act of Congress approved February 20, 1907 and the provision of said section of said Act requiring the reimbursement by the Immigrant Fund for said expenses is hereby repealed."

"The state hospitals prepared in all some 31,861 claims against the Federal Government . . . There followed a change of administration, and no further action was taken."

This ambiguous clause is the alleged authority for covering into the General Treasury, in violation of the Constitutional Provision, the accrued surplus of more than $17,000,000 of head moneys known and referred to as the Immigrant Fund, which has accumulated *because of the restrictions as to its disbursement* imposed by both the Decision and the Act.

The head money is trust money. Its collection was legalized specifically for the purpose of creating a trust fund, and restricted solely to the uses and purposes of that fund. This was the interpretation acknowledged and accepted by the Secretary of the Treasury, when in 1882 he contracted with the State of New York for the "care and maintenance" of aliens and when he contracted with the State of Massachusetts for the "care of aliens who were found to be subjects for deportation" and when these contracts were consummated by both parties thereto, they became valid evidence of the responsibility of the Federal Government under the terms of the Decision.

The section under which the Head Tax is authorized and the Immigrant Fund created has never been repealed.

Head-Tax collections, during the past thirty years, have amounted to approximately $65,000,000, of which a balance in excess of expenditures of upward of $17,000,000 has accrued as surplus to which must be added large amounts in administrative fines and collections.

The annual report of the Commissioner General of Immigration to his superior officer, the Secretary of Labor, has, year after year, accounted for the Head-Moneys as well as the additions from unexpended balances accruing to the surplus, and in many reports has made recommendations as to the possible use to which these funds might be applied for the benefit of the service, all of which were passed unnoticed by both incoming and outgoing Secretaries of Labor, administration after administration.

It is a commonly known fact that a *predatory immigration lobby* has been maintained in Washington for many years, chiefly recruited from New York State but with its long arm reaching to Massachusetts or any other port of entry. To quote the delegate from Massachusetts at the Interstate Immigration Conference:

> "We all feel political pressure. They do find ways of reaching Washington officials and often defeat the law of deportation. . . . . the matter of landing deportable aliens under bond has become increasingly frequent . . . in many cases people have given a bond without any intent of fulfilling their liability."

This same lobby is, it is alleged, now preparing to make another onslaught upon both the immigration and naturalization laws at the next session of Congress. It is, of (*Concluded on page 28*)

"If the law of 1917 fixing a head tax of $8 were enforced, there would be no necessity for the subterfuge of the literary test or a quota provision."

# Psychology and Sex

(*Concluded from page 7*)

trouble. These difficult to recall and emotional events of earlier life were found to be at the bottom of not only paralyses, but dreams, fears, dispositions, attitudes toward religion, and even the choice of a life career.

And at the bottom of these forgotten events there seemed to be in almost every case something traceable to the life of sex. So prominent and so apparently unvarying was this factor in the early cases that soon it came to be searched for regularly. And it was usually easy to find.

As an example take the case of a Boston woman thirty-six years of age, troubled with fainting spells, headaches and depressed periods in which she would weep copiously. She could not force herself to talk about her troubles to others, so the "writing cure" was used. Her writing revealed that in the conflict between the desire to keep the love of a certain man and the attitude of her parents and her moral conceptions a cause was found for her disturbed state of mind. We must check up the assumption of the Vienna psychologists about the source of human mental ailments in the light of the known facts about the animal impulses.

Freud and his followers in psychoanalytic interpretation assume that in human sex impulses there will be found a free floating energy of some sort. Dr. K. S. Lashley, of the University of Minnesota, has made extensive study of the physiological possibility of this existing and says, "There is no sex instinct or sex drive in the meaning with which the words are ordinarily used . . . There is no evidence here for the existence of free energy . . . There is no source of energy which could fulfill the requirements."

Even in a child less than a year old they allege that jealousy—which, of course, must be sexual to be consistent—appears full-blown when a new babe enters the family circle. On this allegation we have on record one experimental observation that is trustworthy. Read here how the experiment turned out when a new babe was brought home from the hospital with its mother to a waiting brother a few months over two years old. This brother had "a very strong attachment to his mother and to his own regular nurse. The mother had been absent in the hospital for two weeks. Billy was taken care of by his regular nurse during these two weeks. The day his mother returned, his own nurse kept Billy busy in his room playing until the conditions for the test were all set."

Dr. Watson describes the test which was made at noon in a well-lighted sitting room.

"The mother was sitting nursing the baby. Billy had not seen the mother during the two weeks. In addition to the mother with her infant, there were present a trained nurse new to Billy, a grandmother, and the father. Billy was allowed to walk down the steps alone and into the room.

"Everyone had been instructed to remain absolutely quiet and to make the situation as natural as possible. Billy walked into the room and up to his mother, leaned on her knee and said, 'How do, Mama.'

"Then he saw the baby nursing. Did he become furiously jealous as the Freudians would have him? Did he scratch the baby or leave the room in a jealous huff? Listen:

"He said, 'Little Baby.'

"Then he took the baby's hands and gently patted them, rubbed its head and its face and began to say, 'That baby. That baby.' Then he kissed it without any prompting.

"The trained nurse, who was unknown to him, took up the new baby. He reacted against this, saying, 'Mama, take baby.' Surely this was as typically an un-Freudian reaction as could be imagined.

"Then the new baby was taken by its nurse to its room and put to bed. Billy tagged along. When he came back the father said, 'How do you like Jimmie?' And he said, 'Like Jimmie—Jimmie sleeping.'"

But Freudianism has made many discoveries about human thoughts and actions and troubles which cannot be denied, although there is not even a common opinion among psychoanalysts about there being a motive for these in the sexual life and apparently no support for such a contention from other scientific sources.

Dispving a Freudian theory.

# The Birds Sing, But Girls "Yawl"

(*Concluded from page 12*)

caught at it. Chinese pupils recite with their backs to the teacher, and the tower of Babel has nothing on a Chinese schoolroom for noise, for the pupils sing their lessons while studying them, and each child seems to sing in a different key and a different air. The noise would be nerve-racking to any American school-teacher, but the Chinese seem to have no nerves. Perhaps it's necessary to study aloud because of the place where the Chinese pupil is supposed to store his knowledge. We foreigners think we store our knowledge in our heads, but the Chinese say they store their knowledge in their *du dz*, which is their stomach. In fact, in China, the seat of learning is considered to be the gall.

Here in Nanking there is a Temple of Hell—a Buddhist temple—which is most interesting to the foreign devil. In it, by means of clay and wooden images, one sees depicted all the temptations to which a human being is subjected. As one proceeds down the narrow passageway, and looks through the high palings which separate one from the temptations depicted, one sees the smaller temptations of life give way to the greater ones, and interspersed with these temptations are the different gods, placed there presumably to persuade the person who has not already succumbed to these temptations to repent, and get away before they become greater and more irresistible.

After a time one comes to the end of the depicted temptations, and enters into a sort of inner temple, where, if so minded, he may buy incense and silver paper money, to burn to the grinning god of that temple while he kotows before him, asking of him that favor which he most craves. There were a goodly number of natives in that place, the day I went through, all performing their obligations to their gods.

On the opposite side of that chapel-like room, in which hung a great bell, were depicted the punishments—the "hell" proper—for which the temple is named. Here are represented the intense sufferings of people who have fallen under the influence of different temptations. Crude as the images were, the intense suffering depicted on their faces was sufficiently real to make an impression; but though there were several natives in that part of the temple, they seemed no more, if as much, impressed as foreigners. They laughed, and evidently joked at the sufferings depicted, but then Chinese laugh when they see suffering in real life, and they say they laugh when they see death, provided it does not happen in their own family.

I began this article in telling something about the pampered birds in Shanghai who are taken to the horse races, that they may be entertained, and given singing lessons that they may entertain. This reminds me of the human songstresses in China, whose mission is also to entertain. Enter the Sing-Song girl!

No one knows how many thousands of Sing-Song girls live in China, but it is a safe bet that each of them, no

Corner in the Temple of Hell, Nanking. One devil is about to cast into hell a man whose arm he has cut off.

matter where found, if asked where she was born, would say "Soochow." Sing-Song girls of China correspond to the Geisha girls of Japan. Like the Geisha girls they are entertainers primarily. When a wealthy Chinese gives a bang-up dinner, he has Sing-Song girls; as soon think of a feast minus the hundred-year-old eggs as to think of a feast without Sing-Song girls. The one and only time I heard a Sing-Song girl I fear I disgraced myself. A foreigner was giving a Chinese feast in honor of the Cramers, and wanting to do it up to the "queen's" taste he had a Sing-Song girl who came into the scene rather late in the meal, which is their custom, and for which I was thankful. It would have been far more awful had she come in at the beginning of the feast, and stayed straight through.

It was about ten o'clock in the evening when she opened the door and sidled into the room, her tiny hot water bottle held stiffly at the pit of her stomach. I don't know why they always carry these diminutive hot water bottles, but they always do, and it is always hugged tightly in the vicinity of the "tummy." They say the Sing-Song girl usually begins her song at the shark-fin course. That again is something I do not understand. Why shark's fins and not old eggs? Why shark's fins and not the sea slug course? There is no tuning up of musical instruments to give the danger signal that she is about to open her mouth, and let a song emerge. To American ears as a sweet songster the Sing-Song girl is a good blacksmith. Anyway, all of a sudden that night when people were listening to the crunch of shark's fins between the teeth of their neighbors at the table, she suddenly broke forth into sound. Song, I could not call it. It all came so suddenly and so loud that I screamed out "Oh!" for she stood immediately behind my chair. She broke into a series of yawls that would have put the old tomcat back home to shame. Two of these much-prized songs she sang, and then as silently as she had come she left, her baby-sized hot water bottle still hugged to her "tummy."

I don't know why Soochow, that sleepy, conservative, old walled city in Kiangsu province, should be considered the home of the thousands of Sing-Song girls in China, unless it be because there is a tradition that Soochow gives more careful training in singing, and more correct training in the mannerisms of the profession, and that the Soochow dialect is more desirable for entertainers and more musical, than any other dialect in China.

But China is China, and the rest of the world is different. The Chinese would modify that statement by "China is China, and the rest of the world is unfortunate to be different."

## Uses of the Coconut

WITHOUT the coconut tree the beautiful islands of the South Sea would not be what they are and some would not even support human life that now are the happy abode of many people. There is absolutely nothing about the coconut tree that is not useful to man and most things about it are useful in many distinct ways. Its fruit is food and drink combined. The meat of its coconut is cut up and dried in the sun, becoming copra, the value of which is steadily rising the world over as more uses are found for its oil content. The shell of the coconut is made into drinking cups and utensils. One frond from its spreading branches makes two baskets, easily woven after the stem is split down the middle, and used for many purposes by South Sea Islanders. Its bark and the wood in its trunk have many uses, too, in building and in the making of wooden implements.

# Oldest Manuscript of the Bible

## The Strange Story of Writings Found in a Cairo Curio Shop

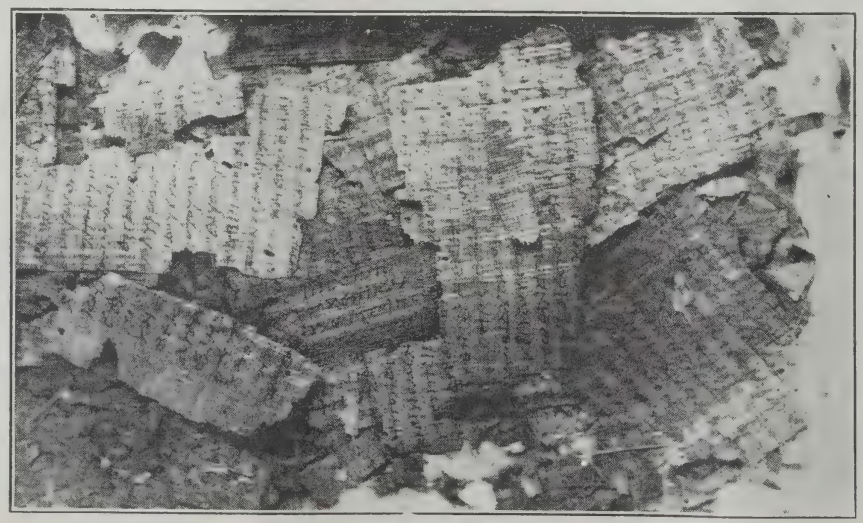
By HENRY A. SANDERS

COMPLETE manuscripts on papyrus are most rare and none of these give us the Bible in Greek. Fragments have, however, been found in the sands of Egypt and there is always the possibility of more and larger ones. In general, papyrus preceded parchment as a writing material, and, especially for the Bible, its use ceased soon after A. D. 300 except for works in Coptic, the native language of Egypt.

Interest at the University of Michigan was accordingly greatly aroused in 1916, when Professor Kelsey received word from an agent in Egypt, that he had found seven Coptic manuscripts from the Hamouli collection in the hands of a Cairo dealer named Nahman and that the price was $5,000, with a fragmentary Greek papyrus of the Bible thrown in. The Greek fragments had not been found with the Coptic but the dealer had secured them so cheaply that he was willing to put them in with the Coptic manuscripts in order to make a sale.

The price seemed reasonable for the Coptic manuscripts alone and they were offered to the J. Pierpont Morgan Library of New York, which had already bought most of the Hamouli collection, and the offer was accepted. Charles L. Freer, of Detroit, was persuaded to take the Greek papyrus of the Bible in case it should prove to be as represented, the price to be $1,000; otherwise it would go to the Morgan Library.

Because of the danger of submarines in 1916 all the manuscripts were placed in a vault of a Cairo bank for safekeeping. Not until 1920, when the work of the First Near East Expedition of the University of Michigan brought Professor Kelsey to Cairo, was there an opportunity to have the manuscripts examined and brought to America. At the first glance the pricelessness as well as the fragile condition of the papyrus was recognized and it was claimed for Freer Gallery at the price agreed. A cablegram was sent to the executors of the Freer estate and the $1,000 was the last indebtedness allowed before the estate was closed on the day following the receipt of the cablegram.



The papyrus fragments, packed in cotton, were sent through the American Embassy to the library of the University of Michigan, where they were received and opened by the writer and Librarian Bishop. The accompanying cuts show the appearance of the larger fragments, when the box was first opened, and of the smaller fragments, which lay under them, as well as another box which contained small fragments only.

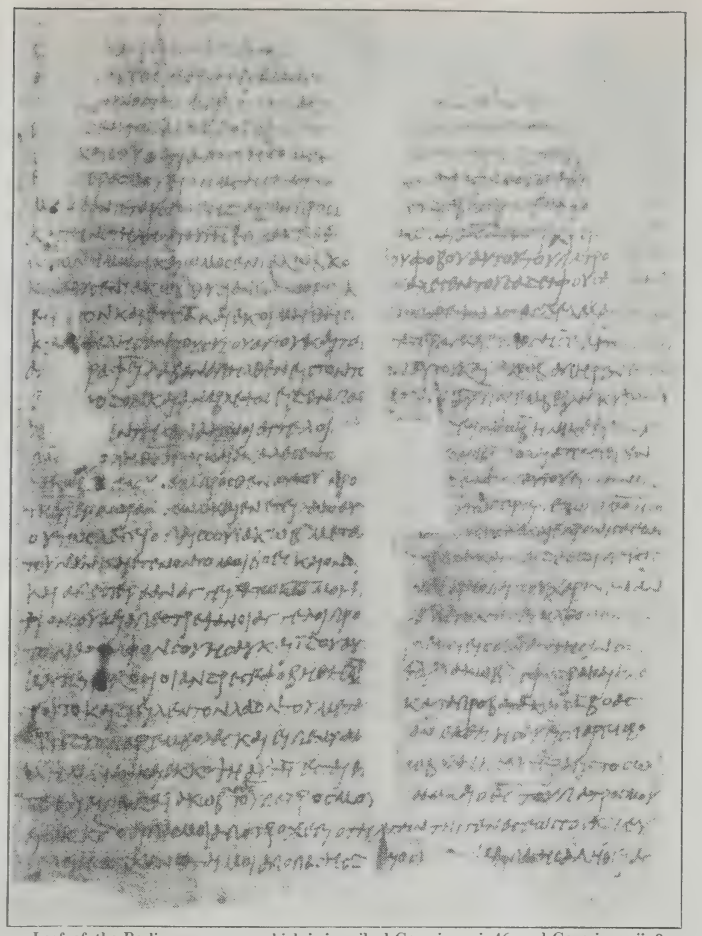
There were twenty-eight of the large fragments, each being about three-quarters of a complete leaf. In the second box were fragments from the missing tops of these leaves, showing that, when the papyrus was found buried a sharp instrument, probably a spade, had cut through the tender material and this first shovelful had been preserved separately. The finder surely knew something of the value of papyrus, for the rest of the manuscript was taken out carefully without further damage and even the surrounding dirt sifted for small fragments. I know of no other instance of a manuscript bought from a dealer, which was accompanied by such a multitude of small fragments. It took more than two years' work to identify and arrange all of them. There were, when arranged, thirty-three leaves of which all except two were fairly complete, as can be seen from the accompanying cut of page fifty-one. They contain the Septuagint text of eleven of the Minor Prophets, Amos to Malachi, and a small fragment of Hosea. The original content had been the twelve Minor Prophets.

At the end in a business hand some one had added a designation of the book, "The Preaching of the Prophets," and the price for copying, "five holocottinoi" that is, silver *denarii*, which were then worth twelve to fifteen cents apiece. The style of writing, the character of the text, and the fact that silver *denarii* went out of circulation before A. D. 300, all combine to date the manuscript around A. D. 250. It is thus approximately a *century older than any previously known manuscript* of the Bible.

The Old Testament was written in Hebrew and the Septuagint is only a translation into Greek, but it was made in the third and second centuries B. C. The Old Testaments in use today are all translated from the Hebrew, of which the oldest manuscripts date from the ninth century A. D. and give the Masoretic text presumably fixed in the second or third century of this era. It is evident that a Greek Old Testament translated from manuscripts four or five centuries older must have great interest for students of the Bible, but its use has been hindered by the uncertain condition of the Septuagint text.

The Christian church during the first two centuries used the Greek Old Testament, but disputes with the Jews were frequent, especially over the question of Christ's fulfillment of Old Testament prophecy. In the second century, three other translations of the Old Testament into Greek appeared; the first by Aquila, seemingly from a Jewish standpoint; another by Theodotion with Christian tendencies; and a third by Symmachus, which seemed to aim at a more literary form. Not until the middle of the third century was the contest settled by the Christians accepting the original Hebrew as authoritative. Origen, the greatest scholar of the early church, was the leader in this surrender and soon after A. D. 250 published his Hexapla, or sixfold edition, in which corrections were introduced or marked in the Septuagint text, so as to make it

Large number of parchment fragments.



agree with the Hebrew.

In Origen's great edition all these changes were accompanied by critical marks so that the scholar could use the Septuagint without confusion. But so great an edition, covering the whole Old Testament with the Hebrew text in the first column, the same written in Greek letters in the second, the translation by Aquila in the third, by Symmachus in the fourth, the Septuagint in the fifth, and the translation by Theodotion in the sixth, was too bulky to be copied. The Septuagint column alone seems to have been usually copied and that generally with the omission of the diacritical marks, though these are found fairly consistently in two manuscripts covering portions of the Old Testament, and infrequently in others.

In the great majority of the Greek Old Testament manuscripts these marks are entirely missing but adaptations to the Hebrew text are frequent. Accordingly scholars have generally assumed that the original Septuagint text is to be found in those manuscripts, or groups of manuscripts, which have a consistent, intelligible text differing from the Hebrew; and that all manuscripts which agree with the Hebrew in such passages have imitated the text of Origen through the medium of later editions based on him, especially those of Lucian, Hesychius, and Eusebius. In fact Lagarde, the best scholar of the Septuagint during the last generation, held that the first task was to reconstitute these ancient additions as far as was possible, and then to use them as an aid in eliminating the corruptions that had come through Origen's Hexapla. This implied condemnation as the corruptor of the text of the Septuagint has been general. In fact, "accommodation to the Hebrew" and "influence of Origen" have usually been considered equivalent terms.

We now have for the first time an opportunity to test that universally accepted opinion, for this papyrus manuscript of the Minor Prophets, though practically contemporary with Origen, is certainly not under his influence. Nevertheless, in a moderate number of cases the text shows adaptation to the Hebrew.

We can understand the conditions best by comparing the text in a pair of examples: For Zechariah, 14, 17, the King James Version gives: "And it shall be, that who so will not come up of all the families of the earth unto Jerusalem to worship the King; the Lord of Hosts, even upon them shall be no rain." A goodly number of Greek manuscripts substitute for the last expression, "even upon them shall be no rain," a phrase meaning "and they shall be delivered unto those (the enemies)." The two phrases are so different that they cannot be derived from the same original. The Hebrew manuscript, from which the Septuagint was translated, seems to have had an older form, differing from that adopted in the Masoretic text. Yet the present Hebrew text was adopted before the time of the translations by Aquila, Symmachus, and Theodotion, for St. Jerome quotes these for the phrase equivalent to the Hebrew. Turning now to our Old Papyrus manuscript we find the regular Septuagint form, but with the addition of the sentence, "and there shall be upon them no rain." Exactly the same sentence is found added in two later Greek manuscripts and, with the omission of the word for "and," also in three others. Practically the same addition, but with a change in the case of one of the Greek words, is found in many later Greek manuscripts. This addition has been correctly referred to the influence of Theodotion through Origen.

Leaf of the Berlin papyrus on which is inscribed Genesis xxxi, 46, and Genesis xxxii, 9. Written in third century, A. D.

Though Aquila was quoted by Jerome in Latin for the same phrase, he cannot be the source of either form of the addition just quoted, for it is known that he always used a different Greek word for "rain." Therefore, it seems that the addition in the Old Papyrus came into the text either from the translation by Symmachus or directly from the later Hebrew. In either case our main conclusion must be the same, namely, that the Septuagint text was being adapted to the Hebrew even before Origen.

There are also examples of accommodation in the Papyrus, where no change is known in other Greek manuscripts. A good example is the first part of Amos viii, 3, where the Septuagint gives, "and the panelled ceilings of the temple shall howl on that day." The form in the English version reads, "and the songs of the temple shall be howlings on that day." The Hebrew, however, may be more literally translated "and the songs of the temple shall howl on that day."

This has seemed strange to the editors and corrections have been suggested, as "the lady singers" for "the songs." The Hebrew word is unusual and perhaps an error, yet Symmachus translated it "songs," as we do today. Theodotion was like the Septuagint, for he translated "the upper parts of the temple." Aquila, who was older and knew Hebrew better, gives "and the hinges of the temple shall howl." This may be a picturesque way of saying "that the temple will be little used, so that the rusty hinges will creak when opened." Such a thought would fit into the connection very well, and it appealed to the scribe of our Old Papyrus, or to one of his predecessors, for here we find the form from Aquila combined with the regular Septuagint: "The hinges and the panelled ceilings of the temple shall howl on that day." Thus far I have found this combination in no other manuscript.

But it is needless to multiply examples. There are more than thirty cases, in which the Papyrus text shows accommodation to the Hebrew or to another translation, in none of which Origen or his source can be shown to agree. Not only was there adaptation to the Hebrew text before the time of Origen, but he seems to have avoided much of it in his text. This old papyrus manuscript likewise gives us a hint as to how these Hebrew adap-

tations may have come into the text, for later hands have made corrections in the papyrus with plain imitations of the Hebrew. There are more than a dozen of these cases and neither Origen nor Theodotion agrees in a single one. Some one, who knew Hebrew, compared and corrected the text of this manuscript in a few places.

As we have in this papyrus manuscript a text that is free from the influence of Origen and all later corruptions, it will be interesting to compare with it other Greek manuscripts, especially those which have been considered the best by modern scholars.

The Greek text of the Septuagint now in common use was edited early in this century by Henry Barclay Swete, D. D., for the University Press of Cambridge, England. He based the text entirely on the uncial manuscripts, written from the fourth to the sixth century. In the case of the Minor Prophets the manuscripts used were the Vaticanus (fourth century), Si naiticus (fourth century), Alexandrinus (fifth century), Marchallianus (sixth century), and Venetus (seventh cen tury). He has given the first rank to the Vaticanus and prints the text of that manuscript with few exceptions. Yet the Marchallianus stands nearer to the Papyrus text; especially when it is supported by the Alexandrinus.

More important is the discovery that many of the most interesting readings of the Old Papyrus are not found in any of these uncial manuscripts. A comparison of the later manuscripts, which have been photographed and studied by the scholars working under Professor Rahlfs at Goettingen, reveals support for practically all of these interesting variants. In fact, five of those later manuscripts stand decidedly nearer to the text of the Papyrus in all their readings, and many others have at least as good a right as the uncials to be considered in establishing the final text of the Minor Prophets.

The uncial manuscripts cannot be defended by attacking the trustworthiness of the Old Papyrus, for an equally old papyrus fragment of a goodly portion of Genesis, found in Egypt by Professor Schmidt some years ago and now in the National Library in Berlin, tells the same story. I obtained photographs of it in 1923 and shall publish it in association with Professor Schmidt.

It is much more fragmentary than the papyrus of the Minor Prophets and less easily legible, as the photograph of one of the pages shows. It also contains more careless errors but the basic text it represents goes regularly with certain groups of later manuscripts against the few and much overrated uncials.

It is perhaps presumptious to accuse modern scholarship of two such decided errors in a single subject, but on the basis of the evidence at hand, it seems necessary to say, first, that neither Origen's Hexapla, nor the misuse of it, was solely responsible for Hebrew adaptation in the text of the Septuagint, for the adaptation to the Hebrew had started long before his time; and, secondly, that there are plenty of manuscripts available for a proper reconstruction of the Septuagint text, if one will only extend his vision beyond the few uncial manuscripts which have served as the only basis of the text among recent English scholars.

Modern research is directing its attention more and more to the early Church Fathers in the study of the origins of the Bible and Christianity, but this study has been in the past directed almost exclusively to the religious side. Here for the first time we find clear proof of the sane scholarship of the greatest of the Church Fathers, as well as of the need for that scholarly work in the restoration of the correct version of the Old Testament. With old errors removed scholars may now proceed to the restoration of the true text of the Greek Old Testament and there is no doubt that it can be made of much greater value in the correction and interpretation of the original Hebrew text.

# Houdini the Book Man

(*Concluded from page 15*)

estimates that these frauds are fleecing gullible people out of more than five million dollars a year. He has volunteered his aid in teaching people how to detect imposters.

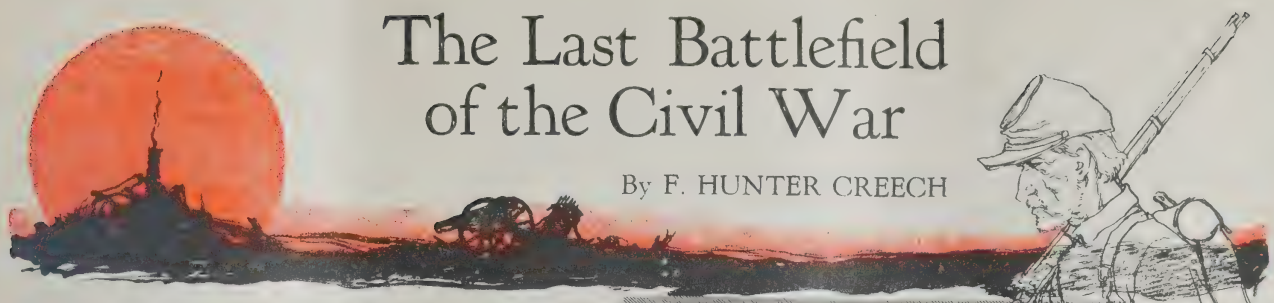
As part of this effort Houdini has lectured before colleges and other institutions of learning throughout the country. The *Journal of Abnormal and Social Psychology* has appointed five eminent Harvard professors and Houdini as a committee to investigate the claims for a $5,000 prize for the first successful demonstration of the actuality of supernormal material phenomena under rigid laboratory conditions and by recognized scientific methods. He also has been associated with the work of the *Scientific American* to sift the claims of those who purport to be spiritualistic "mediums."

Houdini has given instruction to New York City detectives at the police department school in methods of exposing fraudulent spiritualists, psychologists and kindred practitioners. He lectures at the Police College and illustrates by means of actual models the mechanism of these frauds.

Occasionally Houdini himself will lead a group of detective-students in fake spiritualism in the performance of a bit of sanitary work. On such an expedition recently he turned a flashlight on a "medium" who had received messages from a "father" who was still living and also from an unburied "brother" after questions had been asked of the medium by Houdini's fellow investigators. The unexpected gleam of the searchlight in the darkened room revealed a special type of megaphone, designed for easy concealment, in the hands of the woman operator.

Houdini has always declined to reveal the source of his peculiar ability to perform the feats of stage magic that have won him such fame as a legitimate theatrical personage. He intimates, however, that he was born with inordinate physical strength and also that it is but once in several generations that a person is so oddly constituted as he is in ways that are known only to himself. One point he emphasizes in every discussion of his professional work: All of the famous Houdini manifestations are performed entirely by natural means and he positively repudiates the suggestion that anything he does in his mystery acts is aided in any way by the occult. He is a realist whose bewildering acts stir a sense of unseen power until his audiences quite naturally expect him to perform the miracles that his work often suggests. Sarah Bernhardt, on her last visit to the United States, after witnessing a Houdini performance, said wistfully to him, "Houdini, can you bring back my lost leg?"

# Where Does the Head Tax Go?



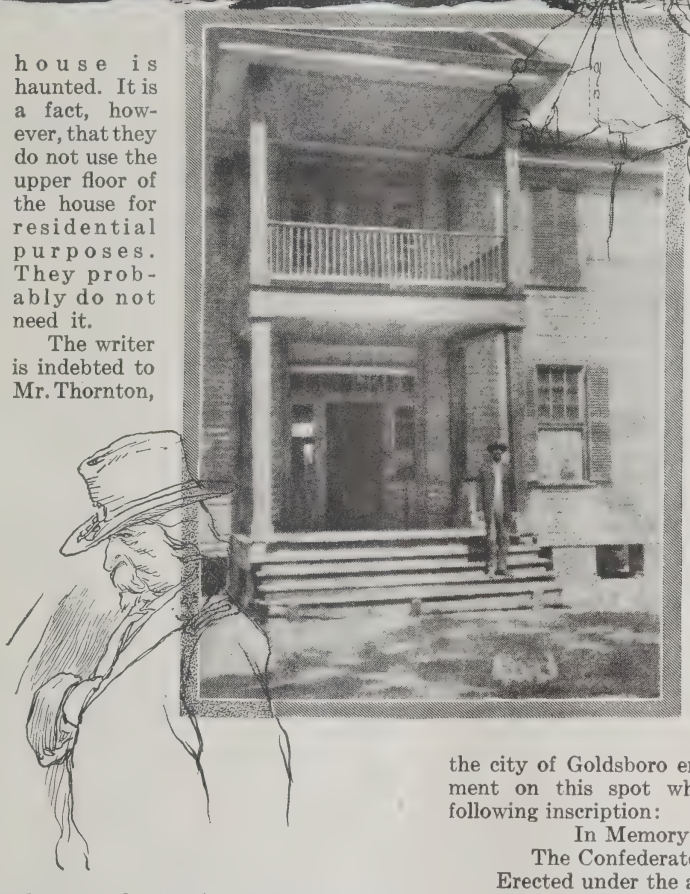
(*Concluded from page 23*)

course, obvious to these subversive interests that *were the claims of the several States against the Federal Government sustained, there would be an immediate revision of the iniquitous bonding system*, a strict accounting of expenditures, as well as a limitation of the discretionary power vested in the Commissioner General of Immigration by which heretofore he has been authorized to promulgate "rules and regulations" that are not only "inconsistent with law" but which have unquestionably abrogated the law. This, of course, would lead to a thorough house cleaning among deportable aliens, for the Immigrant Fund could not be extended to provide maintenance for aliens who were in the United States and in state institutions contrary to law. There are thousands of "Sammy Goldman" cases to be weeded out were the law enforced.

If the law of 1917 fixing a head tax of $8 were enforced, there would be no necessity for the subterfuge of the literacy test or a quota provision, but *the law of 1917 has never been enforced.* Section 3 of that law defining excludable aliens *is mandatory.* Dependent, deportable, and delinquent aliens in the civil and penal institutions of the states may surely be construed to have "fallen into distress" in the language of the statute, and the "citizens among whom they are landed" are furthermore entitled to the protection which restraint places upon them.

# The Last Battlefield of the Civil War

By F. HUNTER CREECH

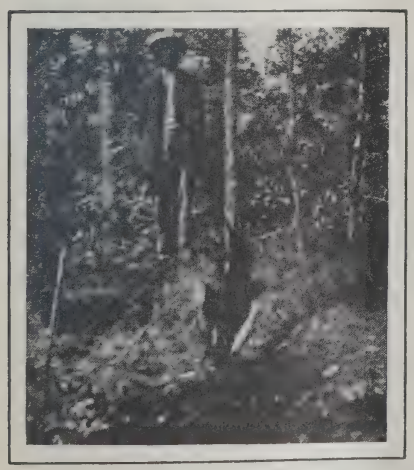


DO GHOSTS walk in the historic old hospital house of the last battle of the Civil War? If you ask James Franklin Thornton, who once lived in the house but who who now resides in the progressive little village of Four Oaks, North Carolina, you will be impressed with the fact that Mr. Thornton is not willing to certify that they do not. The present occupants of the house will tell you that they have never heard or seen anything to convince them that the house is haunted.

Among the citizens there is a division of opinion; some will shake their heads and tell you that no one lives in the house long at a time. As for Mr. Thornton, he will tell you that one night as he and his family sat in the left-front room on the first floor of the house, he heard a noise in the room directly above him which sounded as if a heavy horse were walking from the corner of the room toward the fireplace, and as it reached the fireplace there was a crashing noise as if someone had dropped a large armful of wood.

That night the noise did not arouse the curiosity of the Thornton family to the point of investigating, and for the time it was dismissed with the suggestion that some plaster had fallen. Next morning, however, it was disclosed that the plaster was still intact and there was nothing in the room to indicate what had caused the noise.

Still, the present occupants of the house deprecate the suggestion that the house is haunted. It is a fact, however, that they do not use the upper floor of the house for residential purposes. They probably do not need it.



Mr. Thornton standing on the steps of the old hospital house of the battlefield of Bentonsville, North Carolina.

The writer is indebted to Mr. Thornton, who recently acted as guide over the battlefield of Bentonsville, for a morning full of historic enlightenment. Mr. Thornton owns a farm that constitutes a portion of the old battlefield. It was through his guidance that I visited the old hospital house, and was shown the bloodstains of the wounded soldiers who fought the last battle of the Civil War. These bloodstains are now almost obliterated by the wear of time and dust and neglect.

The house itself was the residence of one John Harper and was taken over for hospital purposes when the army of General Joseph E. Johnston challenged General Sherman for the last time in his march through the South.

Within about five hundred yards of the old hospital lies the cemetery, in a state of considerable neglect. Weeds have grown all over the graves, and there is little to distinguish their correct position. Occasionally, a stone is found that marks the head or foot of some soldier's last resting place, but, as a whole, the cemetery is a level plot of ground covered by a riot of weeds and grass.

Mr. Thorton standing upon the old artillery emplacements used by the Union forces in the battle of Bentonsville, North Carolina.

Some years ago a military company of the city of Goldsboro erected a monument on this spot which bears the following inscription:

In Memory of
The Confederate Dead
Erected under the auspices of
Goldsboro Rifles
October 1894.

There are about 360 unknown Confederate dead buried in this spot, as well as a great many known, and possibly, also, a few Union dead. The monument also bears on its surface the names of many Confederates, from practically every Southern State.

The breastworks of the opposing armies are still in existence. Some of them have given way to the cultivation of fields, but for the greater part their course can still be traced through the woods.

Though more than half a century has passed since the roar of cannon was heard through these forests, the devastating effects of war upon nature is still seen. There are gnarled oak trees, not more than two or three inches in diameter, that are still alive, grown into the shape of a bench. They have grown straight up for two feet, then they shoot out at right angles for about two feet, then straight toward the sky again. This

unique growth has been due to the fact that when the armies threw up their breastworks, they entwined the undergrowth to impede the progress of the enemy. Nature, in a struggle for existence since, has made the best of a bad situation.

The writer has frequently heard his mother tell of hearing the guns roar as the battle of Bentonsville was in progress. War was a horrible thing to that section, as it was through the portion of the South that was pierced by Sherman's army.

Mother was just a little slip of a girl, about ten years of age. Grandmother, shortly before, had died, leaving mother the head of a house of five small children. Grandfather was too old for regular service but had been assigned to recruiting duty in the old home county, so that he might be near his children.

After the battle of Bentonsville, when Sherman left Goldsboro and headed his troops toward Raleigh, one section of his army was diverted by way of grandfather's home, while the other followed the road directly toward Smithfield. This was done for the purpose of foraging. At the old home, all the stock had been secreted at the back of the plantation, with the exception of one old horse that grandfather kept for plowing. Practically all the Negroes of the countryside had left their old masters, save a few faithful old house servants.

Grandfather had been plowing and at noon came in, left the old horse at the watering trough, sat down on the kitchen steps and pulled off his shoes to knock sand out of them. Suddenly he heard a noise and the advance guard of one section of Sherman's army dashed into the yard. They commanded grandfather to get up, they placed him in front of the horses and, barefoot, they double-timed him for about five miles to another plantation where they camped that night. Neighbors called to see the commanding officer and explained who he was and that he had left five small children alone at home, and about midnight he was released and allowed to return.

When the soldiers dashed into the yard, others followed. They soon found all the stock, shot down the chickens, and generally commandeered everything in sight. Beds were emptied of their feathers and filled with corn.

An officer told mother to put anything she desired in a trunk to have the children sit on it and assured her the soldiers would not disturb anything in it. She thought of bedclothing. At my oldest daughter's second birthday mother presented her with a bed quilt that she had packed in that trunk. It was the first bed quilt my grandmother had, made with her own hands, and a thing of beauty. Needless to say, it is priceless. It is more than 100 years old.

Practically everything was taken or destroyed. Several days later mother heard a hen cackle in the nearby woods. Upon investigation she discovered one young hen and a rooster. From these she started another brood of chickens. There was a set of blue porcelain china that belonged to grandmother and prized very highly by mother. This the soldiers took into the yard and experienced great delight in dashing, piece by piece, against the old spring house. As a child, I used to pick up fragments of this old china with which to play. All of these incidents quickened my interest in the battle of Bentonsville.

It is commonly thought that the Civil War ended with the surrender of Lee at Appomattox. It will be recalled that General Grant relates that Lee would not speak definitely for other Confederate generals when he surrendered, but surrendered his command only.

On April 9, 1865, General Lee surrendered to Grant at Appomattox, but it was not until April 26, that the supplemental terms of the surrender of General Johnston's forces to General Sherman were agreed to. Negotiations had been going on since April 18, and Secretary of War Stanton had released certain communications that were published in the New York *Times* that made it appear that Sherman was almost guilty of treason in proffering certain terms of surrender to General Johnston. However, time only served to prove the wisdom of Sherman and the selfish foolishness of Stanton.

The battle of Bentonsville, so little heard of, is of especial interest because of its being the last engagement of any consequence of the Civil War. The heaviest fighting of this battle occurred on March 19, 1865, the battle continuing through the twentieth and twenty-first. The aggregate loss of the Union forces was 1,604, being 191 killed, 1,117 wounded and 296 missing. The Confederate loss aggregated 2,343, being 223 killed, 1,467 wounded and 653 missing.

General Sherman stated in his memoirs: "With the knowledge now possessed of his small force, of course, I committed an error in not overwhelming Johnston's army on the 21st of March, 1865." It was perhaps an act of Providence that he did not. It would have accomplished no useful purpose, as the surrender of General Johnston proved, but would have sacrificed many more lives.

Today, the battle of Bentonsville stands almost forgotten, save by those who live in its immediate vicinity and who are reminded of it as they drive along the roadway and see the old parapets reaching out into the woods. The most of those old heroes who dug these parapets with their bayonets, and to whom the battle of Bentonsville meant the last roar of cannon, the last rattle of saber, in four long years of warfare, have passed to their reward.

## "I Read *in the* Papers—"

***I read in the papers*** that both Italy and Spain, after long neglect of Christopher Columbus, have begun to celebrate his birthday. Probably economic rather than sentimental reasons are behind these belated tributes to the great discoverer. Millions of Italians have gone to the Argentine and other South American countries and the cavaliers who accompanied Cortez and Pizarro into Mexico and South America have been followed by Spanish traders and other work-a-day people. Spain and Italy realize the economic possibilities of maintaining close contact with the national sentiment of Latin-America. More luxurious and faster steamers ply today between Italy and Spain and South America than to North American ports. And South American notions of the United States are largely purveyed by way of the Latin European press.

*The International Jew* in 4 volumes: *The International Jew*, Vol. I, 235 pages; *Jewish Activities in the United States*, Vol. II, 256 pages; *Jewish Influence on American Life*, Vol. III, 256 pages; *Aspects of Jewish Power in the United States*, Vol. IV, 246 pages. Price: 25 cents each; set, $1. The Dearborn Publishing Company, Dearborn, Michigan.

***I read in the papers*** that projects for erecting buildings of fifty stories or more are being discussed. The Tower of Babel is being dwarfed. The time may come when it will not alone be the Andes or the Himalayas whose summits will shine with perpetual snow, but the towers and spires of the cloud-raking buildings of our great cities.

***I read in the papers*** that our familiar affliction, the common cold in the head, is misnamed probably because the acute infection of a microbe that has never been isolated by research workers is usually made possible by lowered resistance through exposure to cold, wet weather. An eminent medical man writing to the London *Lancet* calls attention to the neglected fact that "Colds" are often the starting point for much more serious illnesses and that they should not be treated lightly. "Call them by a name which will better indicate their gravity and stay in bed until they are better" is the gist of his advice. Many colds are already being called "influenza" by physicians who practice preventive medicine. It is a mistake to attempt to "walk off a cold" that may merge into something serious, when a day or two in bed would end the nuisance. Sir William Osler, for a lifetime the medical authority of Canada, the United States and Great Britain, was peculiarly subject to colds. His only cure was two or three days in bed.

# Universal Interest

The advent of the more gracefully styled Ford—the Ford of greater riding ease and comfort—the Ford of greater conveniences, was and is the subject of almost universal interest and discussion.

The reason is that people in every walk of life know that this attractiveness was added to the universal dependability which they had actually experienced over many roads and many years.

They knew that this new beauty was intrinsic rather than superficial. For through the years Ford has demonstrated that quality and precision of parts is necessary to volume production.

Unequalled mechanical facilities, in orderly arrangement, offer the public a Ford car of enhanced quality as well as beauty, without increase in price.

Section of Firestone Gum-Dipping Units

# "I Would Like to Have You See How We Gum-Dip Our Cords"

I wonder how many car owners actually know that the greatest enemy to tire life is heat, created by internal friction, which not only weakens the fabric, but softens the rubber and causes blowouts and tire failures.

The earlier type of tire—the fabric—was of a tightly-woven construction that was extremely difficult to insulate with rubber. The cord tire—a later development—permitted much greater insulation of the cords because of its more open construction. This materially reduced friction and internal heat and doubled the tire mileage.

Firestone chemists and engineers felt that if they could find a way to insulate and impregnate every fiber of every cord with rubber, they could further increase tire life and such a method was found which we have called "Gum-Dipping."

I wish every car owner could see how we carry out this extra process in our special Gum-Dipping plants, and see the Gum-Dipped cords before they are sent to the tire factories for the usual process of calendering. You would then understand why Gum-Dipped Cords are the choice of the largest users of tires.

Firestone dealers—familiar with Gum-Dipping and its advantages—will gladly explain to you how thousands of extra miles are built into Firestone tires by our exclusive method.

H. S. Firestone

It cost the states of the Union twice as much for education in 1923 as in 1918.

Germany has more than four million goats, goat cheese being a favorite dish there.

The motor vehicle and the airplane bid fair to surpass the camel, ancient ship of the Sahara Desert.

Sulgrave Manor, George Washington's ancestral home in England, is to be restored and kept as a museum of Washington relics.

To provide attractive ushers for his theater, a Berlin manager advertised for "60 presentable ladies." Nearly one thousand beauties and near beauties besieged his office. When he attempted to reduce the number of applicants by announcing that only bobbed-haired damsels between 10 and 20 were eligible it was necessary to call the riot squad to protect him from the angry females.

The highest weather bureau station in the world is that of the Regina Margherita "cabin" on Monte Rosa, Italy, at an altitude of 14,960 feet.

The nursery rhyme, "Jack and Jill went up the hill to fetch a pail of water," may have originated in the "Down" country in Southern England, there being many "dew ponds" on the tops of the hills in this section.

It is said that a traveler wishing to walk through Spain can greatly improve his status by driving a donkey loaded with some peddler's wares.

Swimmers in the waters of Hawaiian districts generally wear a sheath knife as a protection against sharks.

A wrist watch was presented to Queen Elizabeth by the Earl of Leicester in 1572. It was described as "an armlet or shakell of gold, all fairly garnished with rubies and diamonds, having in the closing thereof a clock."

Hannibal had a herd of forty elephants in his cavalry.

The first known reference to the sugar beet is found in an old catalog of plants grown in the time of King Merodackbaladan, who reigned from 722 to 711 B. C.

"Thay haif said: quhat say thay: lat thame say," is the inscription which is carved in stone over the entrance to Marischal College in Aberdeen, Scotland, founded in 1593. It is said to be the motto of Earl Marshal Keith, the founder.

The milk of the goat, the ass, and the camel carried in skins was churned on the back of beasts of burden from the earliest days of recorded history.

The Cologne Cathedral, started in 1248 and not completed until 1880, carries the legend that the original architect sold his soul to the Evil One and haunted the edifice until it was completed.

The electron has now taken the place of our fathers' elemental atom.

Ten women are doing "men's work" in the Mount Clare shops of the Baltimore & Ohio Railway. They began the service during the World War, and proved so efficient that they have been retained ever since.

Ankle lamps are the latest fashion for smart Parisian women. The light can be flashed on and off at will as an almost invisible wire runs upward, usually terminating in the wearer's handbag.

The native Hawaiian rat is now extinct save for one small colony on a little island off the north shore of Oahu.

Destructive swells along the Moroccan coast that formerly caused untold damage to shipping are now predicted by studying the barometric depressions across the Atlantic.

Italians in France have quadrupled since 1872.

The word Roorback originated in 1844, when there was published to the detriment of James K. Polk, then a candidate for President, an extract purporting to be from Roorback's "Tour through the Western and Southern States in 1836."

A German, Dr. Karl Mueller, claims to have discovered a process whereby it is possible to reduce metal foils to transparency. This will greatly benefit the telephone, radio and musical industries.

1. Notify us at least two weeks in advance. 2. Give both old and new address. 3. Write clearly.

Entered as Second-Class Matter at the Post Office at Dearborn, Mich., under the Act of March 3, 1879. Additional entry at Chicago, Ill.

# Presented in This Issue:

Mr. Ford's Page this week is on the vitality of men's hope of progress.

---

Congress is not so large as the law requires; for five years Congress has ignored the law that would make it larger; Congress is too large for efficiency as it is; yet Congress is the smallest popular assembly that any chief nation has. These facts create a certain problem. (p. 3)

---

The movies sulk because they have no standing with the intelligent classes. They lack this standing for obvious reasons which are clearly set forth. (p. 6)

---

Widows of statesmen were sentimentally popular as successors in office until other than "regulars" began to die; then the question came up. (p. 5)

---

Among the monumental literary works of the country are the Catholic Encyclopedia and the Jewish Encyclopedia. They are authoritative works of reference. A want has been felt for a Protestant work which should be similarly informative and authoritative. It is now to be supplied by "The American Encyclopedia of Christianity." The Editor of *The Continent* writes this article. (p. 14)

---

The romance of common salt, and its hundred uses, from laying the dust of roads to starting the stopped heartbeat. (p. 18)

---

How does tobacco affect college men? Antioch College made a test and a report. It's not so bad an effect as the extremists say, and it's not so good either. (p. 8)

---

Congressman Madden has a word about taxes that should go a long way, coming from him. (p. 8)

---

"Anyone can make a speech," says Mr. McCauley. No doubt of it. The best speeches are made by men who think they can't. They have talked so little they still have something to say. (p. 24)

---

Another installment of "Romantic Rascals" this week. This series has been unusually popular. We are glad, even though we are more interested in giving our readers the unbiased facts of modern problems. Jorgensen the First of Iceland, with his flag of three white cod on a blue field, is one of the most likable of all the rascals Mr. Finger has brought back to us. (p. 16)

---

The Riff country is daily in the news. Here is the scene from the Spanish side, an article redolent of the odors, colorful with the sights and clamorous with the sounds of African coast cities, Straits steamers, Barbary corsairs and modern bombing planes. Mr. Pritchett convoys us from Spain to Morocco with every realistic circumstance. (p. 2)

---

No better work can be done these days than close up the American line. We have been straggling. Eyes right to the First Americans! We are their heirs in every sense; we stand here in security because they stood firm in danger. The Signers of Maryland are presented this week by Mr. Lowden. Bold and saucy patriots, were they. The Reds of today point to them as co-revolutionaries. Yes, with this difference: our political forefathers were constructive. Their movement was their own, not alien-born, not spirit subversive. This puts the American Revolution as far from Bolshevism as Gabriel is from Satan's throne. (p. 20)

---

The Engineer is the prophet of the present; the Engineer spirit must infuse all the other professions, as it has medicine. Politics will be purified by Engineers. A good engineering story. (p. 12)

# From Spain to Morocco

## Bad Smells, Barbary Corsairs, and Bombing Planes

By V. S. PRITCHETT

MY FIRST sight of the Moroccan coast, indeed my first sight of Africa, came after a day of dust, animal heat, and heavy salt coastal wind on a southward journey from Seville, Jerez to Algeciras. Still in my ears drummed raucous, gypsy Andalusia. I stopped at an isolated *parador* at the foot of the hill of Vejar, an almost inaccessible hill-town left by the Moors, an eagle's nest, a white gull on the tip of Andalusia's ocean of hills. Two gypsies were rending meat in the *parador* and they graciously offered me their meal. Then one got up, seized me by the shoulders and shook me merrily and cried in his dialect, "Ha, friend, we are good friends, eh? And if I met you in trouble I'd help you, no? And if you met me broken down on the road you'd help me, true? Now, tell me man, did you see the black saint on the road, the little black saint?"

He staggered away and drank more sherry; and so I left him, wondering how different the Moors would be when I discovered them in Morocco. The man's broken-up words, the sour, flat smell of wine, the flapping February heat, the powder dust and the spring clouds—a disarray of thunder-stained spheres—toppling among the high inland mountains, all seemed part of some humid, noisy gypsy song, a strained flamingo. The Moors had gone four hundred years before and Andalusia had been their stronghold and pleasure dome for hundreds of years. The Spaniards themselves were of Berber origin. Would Morocco be so different after all?

Then from a loop in the coast mountains I saw the mirage—Africa. Across the Straits, cloud high, was a long line firm enough to be seen, delicate enough to be scarcely visible. It outlined a far-looming form of gray paling into silver lavender which, descending, fused into penumbra over the sea. A gray petal against a silver sky, the African coast. With Africa only seventeen miles away, and the needle home lights of Gibraltar across blue Algeciras water, I slept that night a perfect sleep—an unconscious exultation—such as I had rarely experienced on Spanish soil.

The next morning the civil governor of Algeciras covered my passport with his costly and enormous signature and I left at noon by steamer for Ceuta, the nearest Moroccan port. White Algeciras cringed and flashed in the blue heat, sunken like a pirate city. It is a place of contraband, a haven for smugglers. They run their craft between La Linea and the town, creep over the boundary or bribe the armed *carabineros* who stand by almost every yard of that eucalyptus-dappled strand. The days of the Barbary corsairs seemed near.

The steamer plying between Algeciras and Ceuta runs when the crossing permits. The journey is often hazardous. Sometimes no mail crosses the few miles of Straits for a fortnight, ships drag anchor and are broken up against harbor walls or are sucked out to sea. My own return journey from Ceuta was horrible. I crossed in the wake of a four-day gale and before boarding the bobbing coal scuttle of a ship, I saw the carcasses of a dozen or more drowned horses on the Ceuta strand, where an enterprising Arab fellmonger was flaying them then and there. We broke plenty of crockery and glass in the crossing and as one wave came over the boat—as we got into the middle current—the chairs and tables shot into a heap in one corner of the salon and a Spanish officer suffering on the couch crossed himself devoutly and shouted, "Oh God, save us!" with great emotion.

The market place in the native quarter.

On deck a peasant woman and a man were quarreling hysterically in rending shrieks. The woman was being brought to Spain against her will. We were taken ashore on a launch—the steamer could not dock owing to the heavy seas—and the woman having knocked two officials to the deck, squared up to her husband, and the two of them flung at each other aided by the green upheaving of the boat.

My outgoing journey was fortunately peaceful. Chickens, ducks, pigeons, goats, mail, newspapers, rice, grease, food, vegetables, and oil were thrown about the deck and the boat smelled infernally of decay and blistering engine oil. On the

Tetuan. Plaza de Espana, where the Arab and Spanish quarters merge. Palace of the Caliph in right-hand corner.

# How Large Should Congress Be?

## Meanwhile Reapportionment Waits

By OTTO WILSON

WHEN Congress meets again in December it will face once more a duty it has been putting off for five years—the duty of redistributing its membership among the several states to accord with the population changes revealed by the 1920 census.

Never before in our history has this reapportionment waited so long after the census returns were available. Usually Congress has passed the necessary legislation in the year following the census, sometimes in the census year itself. In no case until now has it failed to act before the next ensuing Congressional election. But since 1920 not one but two Congressional elections have come and gone, and still the delegations of the various states remain fixed in accordance with their population of 1910.

As a result nearly half the states are represented in the lower House of Congress by either too many members or too few. This state of affairs is contrary to the spirit if not the letter of the Constitution, which decrees that, "Representatives and direct taxes shall be apportioned among the several states which may be included in this Union, according to their respective numbers."

Incidentally, the failure to reapportion the Representatives in the House bears directly on the choice of President and Vice-President of the United States. In the big conventions of the two major parties each state is represented by twice as many delegates as it has members of Congress, and in the electoral college each state casts as many votes as it has Senators and Representatives combined. At the 1924 conventions in Cleveland and New York, the Pacific Coast States should have had at least eight more votes than they actually cast, and Michigan should have had four more. In the election the west coast should have had at least four more electoral votes and Michigan two more.

Why has Congress so long held off making this necessary readjustment? Not from negligence alone, for many reapportionment bills have been introduced, and some have been debated and voted on.

The fact is, that Congress is now squarely facing an issue that has been steadily drawing nearer and nearer for 135 years. It can hardly be evaded much longer. Even if it is put off once more without definite decision it will come back in more insistent form than ever five years hence, when a new census is again taken.

*How big shall Congress be allowed to grow?* What *maximum number* shall be set as the limit beyond which the House of Representatives will be considered too large to function properly? That general question has so perplexed the national legislators that they have been unable to get together on any proposed reapportionment scheme, and that question, in the end, will doubtless have to be decided by the force of public opinion.

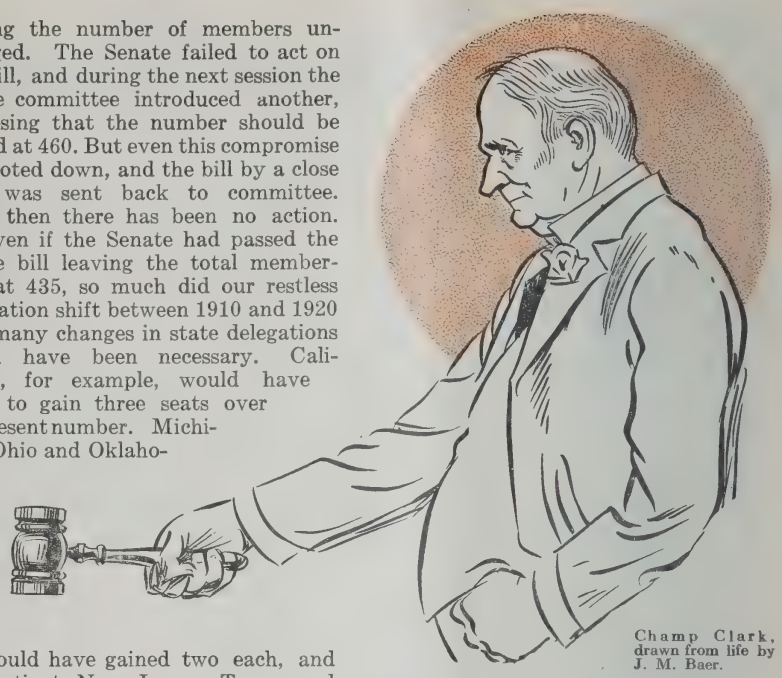
Many Americans think that the lower House is already so large as to be unwieldy. When the Constitution was adopted it started the House off with sixty-five members. That small body could meet in an ordinary chamber and debate every question fully, with each member having an opportunity to take a hand in the discussion. Now there are nearly seven times that number. They meet in a great hall and carry on their work often amid such noise and confusion that at times it is hard for a member on the floor to keep track of what is going on. When the confusion is at its height it requires real physical as well as mental sturdiness on the part of the Speaker to keep this restless, buzzing, joking, smoking, arguing, laughing crowd of hundreds of men and one or two women in hand. No Speaker ever tried harder to handle them than the late Champ Clark. Gallery visitors and members will never forget how his big voice would break into the debate every few minutes when the noise was unusually bad, roaring in outraged tones a regular, stereotyped formula accompanied by lusty swings of the gavel:

"The *House—bang!*—will *be—bang! bang!*—in *ORDER!* Gentlemen in the aisles will—*take—their—seats!* Those wishing to converse will—*retire to the cloakrooms!*"

Yet even Champ Clark, though he hammered many gavels to pieces, achieved only a partial success in preserving some sort of order.

It is the individual member, especially the new member, that suffers most from the growth of the legislative body. In his home district he looms large. He is the selected spokesman for more than 200,000 men and women. But in Congress during his first term or two he is likely to cut such a small figure that often he comes to feel that it would make little difference if he were to vanish entirely away. At every turn he has thrust upon him the feeling of being "out of it," but especially when he tries to take a hand in the process of making laws on the floor of the House.

All legislation, he finds, is controlled by a system. The leaders of the party in power start with a mapped-out program which they vary from time to time as circumstances make necessary. The leaders of the opposition also have a negative sort of program, which in



the nature of the case consists mainly in opposing the chief measures of the controlling party, especially when those measures reflect traditional differences of party doctrine. On both sides the leaders are almost invariably men who have spent long years in Congress. Between them the two organizations shape the legislation of the lower House, the one driving it through at times ruthlessly, the other modifying, delaying, criticizing, or on occasion helping along and claiming as much of the credit as possible.

When the party powers invoke the "gag" rule he is practically debarred from amending a measure that is being considered on the floor. He may not even be able to express his views on it, pro or con, for the benefit of the listening 200,000 voters back home. Very soon he finds that, on the floor of the House (and hence in the public eye), he has just about two prerogatives which he can exercise freely at all times. He can introduce bills, by the bushel if he likes, and he can vote.

However much this may irk his feelings of self-importance he is forced to admit, when he studies it over, that some such system is a matter of pure necessity. The size of the House makes it so. Should each one of the 435 members be given a free range in debating every bill that came up, the amount of business the House could put through in a session might be small indeed. Even as it is the House is by no means a model of efficiency. To carry through a legislative program of important big measures along with scores of minor bills in which influential members have a special interest requires a rare parliamentary skill and a knowledge of House procedure which only members of long service can attain.

With every increase in the size of the House this sheer necessity for a system which suppresses the individual becomes greater. So the new member outside the councils of power has about decided that the process of expansion has gone far enough. Early in 1921 the committee on the census, following the custom of nearly half a century, reported out a bill again increasing the membership, this time from 435 to 483. But the House balked. After a lively debate it rejected the report and adopted instead a minority report leaving the number of members unchanged. The Senate failed to act on the bill, and during the next session the House committee introduced another, proposing that the number should be placed at 460. But even this compromise was voted down, and the bill by a close vote was sent back to committee. Since then there has been no action.

Even if the Senate had passed the House bill leaving the total membership at 435, so much did our restless population shift between 1910 and 1920 that many changes in state delegations would have been necessary. California, for example, would have stood to gain three seats over her present number. Michigan, Ohio and Oklahoma would have gained two each, and Connecticut, New Jersey, Texas, and Washington one each. On the other hand, no less than twelve states, chiefly in the Middle West, would have lost, Missouri dropping two seats, and Indiana, Iowa, Kansas, Kentucky, Louisiana, Maine, Mississippi, Nebraska, North Carolina, Rhode Island, and Vermont one each.

Champ Clark, drawn from life by J. M. Baer.

This would be the most drastic cut since 1860, when thirteen states suffered losses. Congress distinctly dislikes this process of cutting down state delegations. When a member votes for such a measure he puts many of his friends in danger of losing their seats, if indeed he is not one of the unlucky group himself. So the pleasant custom has grown up of raising the membership every ten years to just that point where every state will be assured of keeping all the seats it has, while those with increased population will gain several seats. Since 1880 no state has suffered the loss of a single member, and since 1860 only four seats all told have been cut off, three from New England and one from Virginia. But obviously the process could not go on forever, and from its action and inaction in the last five years Congress thinks there is no better time to stop it than now.

Should the House membership be kept at 435 it would still be the smallest popular assembly of any of the chief countries of the world. The House of Commons is the largest, with 615 members. Before the Irish left the number was 707. The German Reichstag has 493, the French Chamber of Deputies 580, the Italian Chamber of Deputies 535, and the Japanese House of Representatives 464. But in all these countries the parliamentary form of government prevails, and the government majority simply takes charge of the legislative program. Most of the time the actual work of legislating is carried on with only a fraction of the full membership in attendance. The difference between the parliamentary system and our own is shown by the fact that *90 per cent* of the public bills sponsored by the "government" in the British House of Commons become laws. In our Congress only about *one per cent* of bills introduced are finally written into the statute books.

Left to right—Mrs. Mary T. Norton, newly elected Congresswoman from New Jersey; Miss Alice Robertson, former Congresswoman from Oklahoma, presenting a bouquet to Mrs. Winifred Mason Huck, who succeeded her in the recent sixty-eighth Congressional election; Miss Jeannette Rankin, former member of the Sixty-fifth Congress.

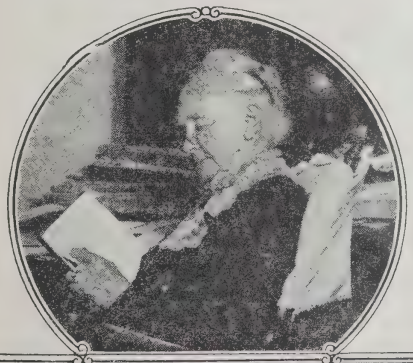
# Does the Office Belong to the Widow?

## Three Congresswomen and One Governor Elected to Fill Their Late Husbands' Places

By HARRY PENCE

MISS JEANNETTE RANKIN was a member of the Sixty-fifth Congress (1917-1919) and found the experience disappointing. She did not seek reëlection.

The Sixty-sixth Congress was a "stag affair" and the last of that kind.



Miss Alice Mary Robertson entered the Sixty-seventh Congress from Oklahoma and although she did desire a second term she was defeated for reëlection.

She bore her defeat gracefully, however, for one of her first acts on returning for the "Lame Duck" session was to present a big bouquet of roses to Mrs. Winifred Mason Huck, of Illinois, who had triumphed in the election that Mrs. Robertson had lost.

In the old days in Illinois a fearless, honest man fought his way into the United States Senate. Even his enemies respected "Billy" Mason, but he had the misfortune to rush heedlessly into the era of rigid party regularity which has made party collar-wearers of many otherwise admirable men. He fought corruption at home and he opposed the imperial policies of the administration at Washington. This cost him his official head and in 1903 William E. Mason was elected to private life.

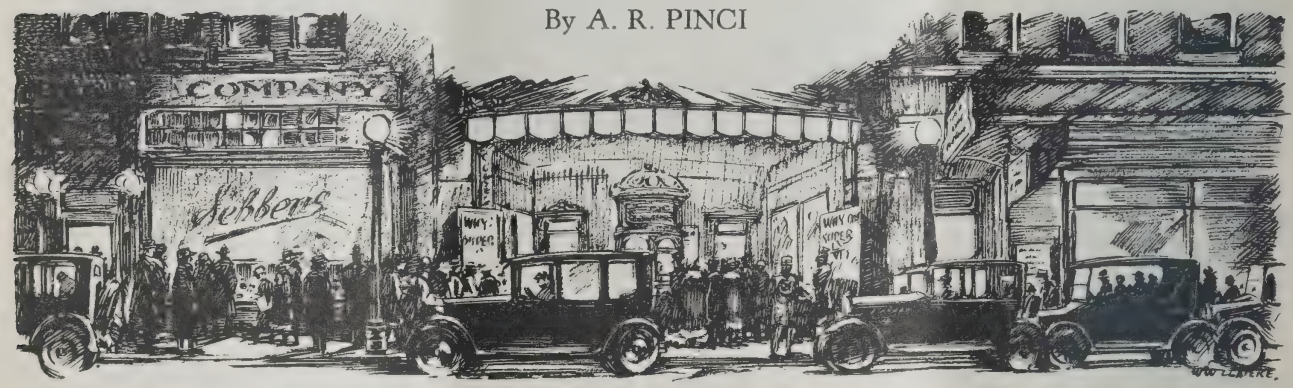
He "came back," however, and was serving with distinction as Representative-at-large from Illinois when he died, June 16, 1921. For years one of his ablest aides and advisers had been his daughter Winifred, married to Robert W. Huck, of Chicago, and mother of four interesting and intelligent children. Mrs. Huck had, and still has, a keen interest in public affairs and she is no political novice. She entered the race to succeed her father and was elected for the unexpired term in November, 1922. This was all she had to expect, for at the same election that seat in the Sixty-eighth Congress was filled.

Her service extended only from November 20, 1922, when Congress was called into special session, to the following March 3. In that time she endeavored, without success, to bring about the submission to the states of an amendment to the Federal Constitution requiring a popular referendum before the country entered into warfare.

Mrs. Huck, however, seems to have established a political precedent. In a sense she inherited her seat in Congress. It was a tribute to her respected father. While she was still in Congress one of the veterans of the House, John I. Nolan, of San Francisco, died and on January 23, 1923, his widow, Mrs. May Nolan, was elected not only to the unexpired term but to the Sixty-eighth Congress as well. She took her seat at once and was the only one of the three Congresswomen listed among the hold-overs.

Mrs. Nolan narrowly escaped the distinction of being the only woman in the Sixty-eighth Congress. Julius Kahn, also of San Francisco, died December 16, 1924, and on February 17, 1925, his widow, Mrs. Florence P. Kahn, was elected to succeed him. Thus, for a brief time, the Fourth and Fifth districts of California, both embracing parts of San Francisco, were represented by women.

Mrs. Nolan's services have ended. Her successor has been elected. But Mrs. Kahn will not be the only widow of a Congressman in the next House of Representatives. The East as well as the West has chosen to follow precedent. John J. Rogers, (*Concluded on page 26*)



Circle—Mrs. Rebecca L. Felton, who succeeded Thomas E. Watson, of Georgia, as Senator. Lower (left to right)—Mrs. Nellie Taylor Ross, Governor of Wyoming; Mrs. Florence P. Kahn, elected to succeed her husband, Julius Kahn, of California; Mrs. Edith N. Rogers, Massachusetts, who succeeded her husband, Congressman John J. Rogers; Mrs. Winifred Mason Huck, Congresswoman from Oklahoma; Mrs. M. E. Nolan, present Congresswoman from California.

# Why Our Movies Move Us Not

## Is It Because the Film Misrepresents More Than It Represents?

By A. R. PINCI

PEERING from countless nooks and corners and shop windows an equally countless number of placards in multicolor have been announcing that this is a "Greater Movie Season." At first these placards seemed part of an advertising campaign, but in reality it is the first confession of inadequacy that producers and distributors have voiced. It is becoming evident to moviedom executives that the movies have stopped going forward. Their immediate task is to keep them from sliding backward, and to that task moviedom is dedicating itself more frantically than surface indications reveal.

***Position of Moviedom Is Unique***

This situation makes pertinent the question that the industry has been asking, not so loud that the public might hear, and that question is:

"What is the matter with our movies?"

Much of the criticism leveled at the movies has been less criticism and more attack. To attack an industry that every day quenches the wants of a few hundred millions of persons, more or less, is as senseless as it is futile. No attack can ever possibly hurt the movie business; if it is doomed to fail the cause will be congenital.

The major trouble of the movies is one from which no other industry or business suffers. Moviedom is the only commercial entity under the spell of transcendence, incomparableness, perfection, greatness, indispensability, and the combination of these and other superlatives has for convenience been boiled down to the now commonplace prefix of "super."

Unfortunately for the movies, the only adjective which describes them as a whole now is the word "superficial." This does not apply to the inevitable exceptions, which are indeed rare, but it applies to productions as a whole, as they are dished out to haphazard audiences in scattered theaters in horizonless localities, meaning that the movies do not fulfill the very mission that can and would make them progressive as well as indispensable. They have grown, and beneath the veneer of monetary glint one may see that they have grown commercially only. Now the limit of that growth is in sight. Either they must grow artistically by fidelity to life and living, or they must perish industrially.

Going to the movies is still a mere time-killing mission and nothing more. That realization has rankled the movie magnates and the movie directors. Shekels galore have been taken in but the relationship is impersonal, as far as the classes are concerned. For every time that one says, "Let's go to see Polly Moffett" or "Asleep in Bed," each denoting a great actress or an epical play, a thousand say, "Let's go to the movies." Any actor, any title, any theater, just so the show conveniently uses up alleged unusable time. Every means this world affords for distraction or vacation deploys some devotees from those who "don't care what it is so long as it is something," as in the case of travel, reading, motoring; but with the movies the proportion is the other way. It is so because the movies they have been giving us deserve no better welcome.

Moviedom suspects, and rightly so, that people pay to go to movies but that most of them go with a more or less conscious sense of protest, due to what?

***Our Intelligence Is Jolted by Something Wrong***

Due to the fact that when we go to the movies our intelligence will be jolted by something wrong that should have been right. Impersonally, impalpably, we as spectators cannot forgive that. We cannot forgive it in the face of the superadjectives with which producers and directors have clothed their achievement.

We go to the movies for entertainment. Thus we are not disposed at the outset to be overcensorious and we disclaim a wanton urge to find fault, even when such exists, so long as we are convinced that the fault is pardonable within the limit of human fallibility. Movie producers make and must make their quota of mistakes in their business as each and every spectator must make mistakes in his or her business. It is not the faults or the mistakes that irk us; it is the conviction that they try to sell us something as perfect when we know it is not so. Not every audience knows that; but some one in each audience knows it.

***We Allocate Blame for the Defects***

Publicity and propaganda have done their utmost toward softening the senses of the masses, and these take riotous colors, crowds, scenes, as a sign of "greatness," but those two narcotics have failed to prove effective with the classes. Advertisements will serve the purpose when they move you or me to enter a theater to see a certain show, but we enter indifferently, often aware that if we had something better to do we would do it. We become spectators, but how often have you remained tense, as if on guard against something superidiotic that makes you feel the same way for what you paid to attain that feeling?

So we begin to harbor a grudge against the producer, the director, the star, the supervisor. We blame each and we blame all for their combined inability to catch and remedy defects or absurdities that often transcend the comical. Don't let us blame the spectator who laughs aloud in what may seem the wrong place. You and I may not laugh aloud but we are in sympathy with the unknown a few seats away in the darkness. In fact, that unknown truly gets money's worth in that laugh. He or she is another to be added to the classes who thenceforth will refuse to take the movies seriously, if at all.

Moviedom would have us believe

otherwise, but the fact remains that there are thousands of thousands of individuals who seldom go to movies. This absenteeism is growing, too; it is no longer considered bad form not to have seen the "latest movie," whatever that is, any more than not to have seen the latest play or read the latest best-seller. One may still circulate freely among fellow men and women and not go to the movies at all; moviedom has failed in inspiring an outcast class made up of those who don't attend the movies.

Moviedom is now beginning to assume the defensive. After bombarding the public with the most blatant effronteries it is now cajoling us. The peppy ad with the punch is yielding to the genteel suggestion that "this is a greater movie season." That hint is intended for you and for me. The masses still can be psychologically defeated by eight-sheet posters, stupid phraseology, overawing unfinished climaxes, but the masses furnish mere money, and superartistry in supermovie superproductions must feed on something else than mere cash. The masses are apt to trample upon their movie favorites without notice or favor; and look at the household names of a decade ago that none of us can remember today! To make fame, especially the probationary fame which must necessarily be theirs during such industrial transition, the masses are useless; it takes the classes. But the classes are either apathetic or absent.

***"First Nights" Have Been Inaugurated***

Moviedom has undertaken to end absenteeism and to bring enthusiasm. So beautiful theaters, scientific ventilation, excellent music, special features, careful service and even radiocasting have been provided for. "First nights," even to French nomenclature, have been inaugurated; a première may cost even $5.50 including tax in New York City, which is going some, especially for those of us who have seen many satisfactory films, masterpieces of their kind, for a nickel, at a time when every night was "first night" too. In those days we went to the movies for recreation and were entertained, but we were satisfied in our minds that we were not overawed into the submissive rôle which film propaganda has created for us nowadays. In other words, we refuse to go to the movies as incense bearers to the superclass that has patterned a halo for itself without our leave. We won't deny the existence of excellent film workers; we may even admit that genius may not be alien to some of them; but we don't want their say-so or the say-so of well-anointed publicity.

The two-exhibition-daily policy has been tried, with reserved seats an' everythin', but filling houses has been another story. The chief purpose has been one of advertising necessity, predicated on the conviction that the rest of the country will not consider a movie a howling success unless it has gone through its Broadway baptismal performance. This belief is dwindling, but in its last days it is being used as a high-power selling slogan. Not to mention the absurdity of labeling "Broadway showing" an exhibition in the side streets. The trade permits this "courtesy," but, I ask, if the performances are so incomparable, if the genius of directors is so conspicuous, why is it necessary to attach the Broadway label to tell us about it, we who know how undiscriminating and mediocre the average Broadway audience really is?

***Most Dangerous Tendency of the Movies***

With any number of pictures turned out every day it is quite impossible to demand originality in the sense that sometimes originality is called for. Authorities are unanimous that there are not new plots and few new climaxes. So far the movies have been most original in their belief that they are furnishing us with truly original entertainment, when most of them are revamped plots of yesteryear and often yesterday.

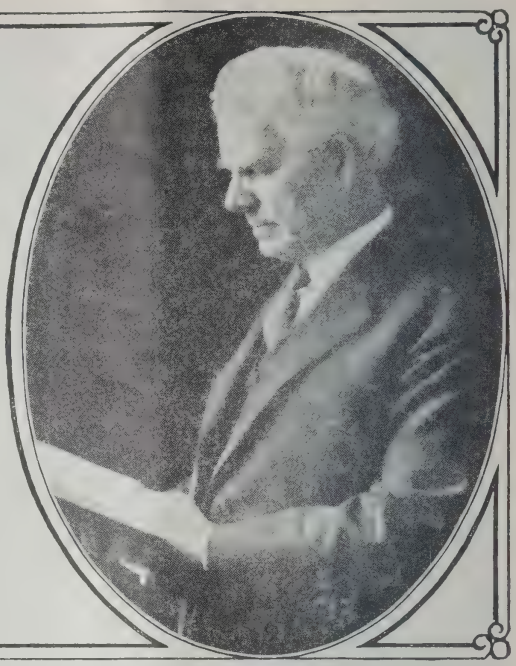
Moreover, the most dangerous tendency of the movies is their insinuation in our midst as educational. On the strength of this word they have broken down certain barriers that seemed impregnable a few years ago. That they should be educational I do not question. But that they are educational in a teaching sense it is true—but they are misfit educators. How long would we tolerate teachers that taught what is not so?

Certain reformers have striven to blame the movies for much that is wrong in our daily life, and have even gone so far as to connect them with the wave of crime that is harassing the civilized world. Some movies perhaps exceed the reasonable in portraying badness, but it is not in the honest portrayal that they err. Their greatest mistake, almost a crime, lies in their portrayal of crime as it isn't. It takes them four and a half reels to develop badness and a hundred feet to portray nemesis.

Neither czars nor laws will ever save or condemn the movies. They have to transform themselves as mirrors of life and they have to do it against the insuperable odds of intelligence as represented by the classes. It is too flimsy a comfort to movie magnates that the movies are now a habit and at the very worst enough people will go to pay the industry for the trouble, hence their definite attempt to induce the classes to consider this a greater movie season.

***Should Cease Harping About Education***

The movies have everything. From the chairman of the board down to the brigadier general of studio street-sweepers, superproductions carry more titles than Burke's Peerage and Almanach de Gotha put together. Try it at the next superpicture you will see; note the assistant title editor and the other assistants.



The movies should cease harping upon the claim that they are educational. That is the chief and growing grievance which American families have against the movies; it is also the chief reason why abroad they fight to see our movies and then satirize them. It is why, more than ever before, foreign peoples have an erroneous conception of the United States and I would not be far wrong if I said that some of the irritation felt against Americans on the part of foreigners may be directly attributable to what they imagine is the American mode of life, as movies picture it.

As things are now in moviedom, they can still sell us, on occasions, the opportunity to kill two hours' time, but we are not buying the entertainment seriously. It's up to the movies to save their market—and that market can be saved only by insuring the respect of would-be audiences.

### CONGRESSMAN MARTIN B. MADDEN'S STATEMENT ON TAXES

"I think the Inheritance Tax should be repealed. A 40% maximum tax, which is what the present law provides, is prohibitive, but any tax is unjust. The tax on inheritances must be paid while the estate is in the process of adjustment. That compels the heirs to borrow money and frequently imposes a burden on them which the estate is unable to bear. It forces the estate into the hands of a trust company or some other banking institution which supplies the money with which to meet the tax needs of the government and centralizes the power which should be exercised by the heirs themselves in the banking fraternity of the country. It frequently bankrupts the estate, but in any case it requires a mortgage to be placed on it. It takes it out of the hands of those who really should have it in charge. It is far better to have a live taxpaying estate than an estate which is bankrupt by the collection of the Inheritance Tax. It often requires the estate to be liquidated, the business discontinued, and costs much more to the government and to the citizens affected than its value can possibly be.

# How Smoking Affects College Men

"Antioch Notes," a bulletin of Antioch College, Yellow Springs, Ohio, contains in the issue of September fifteenth an interesting article on "Tobacco and Scholarship." It says:

A CAREFUL study of smoking among men students at Antioch does not disclose any permanent effects of smoking upon blood pressure, lung capacity, or pulse rate; but a definite relationship is established between smoking and low scholarship. Among men students, 31.8 per cent of nonsmokers fail to maintain required grades, while 62.3 per cent of heavy smokers similarly fail. "Inhalers" fail most often. Before this study began, the more susceptible smokers had been eliminated, since many more smokers than nonsmokers had failed and been dropped from college.

A study of smoking among men students at Antioch has been pursued with thorough care and in accordance with sound statistical methods. Antioch students provide material of quite unusual value for such a study. Nearly all parts of the country are quite uniformly represented. About half the men smoke, and these do so openly. There is no motive for secrecy or deception. The men have shown interest in the research, assisting generously with information.

***Smoking and Athletics***

In actual experience at Antioch, nonsmokers seem to do slightly better in athletics than smokers. In track meets during the past two years they have gained an easy majority of points. On the other hand, all important events in our first swimming meet, held last spring, were won by two experts, both of whom were habitual smokers.

Of 177 students who now smoke, 74 gained athletic "letters" at high school or preparatory school, and 21 have won the college letters. Of 176 students who do not smoke, only 56 gained athletic letters at high school or preparatory school, but they also include 21 representatives with college (Varsity A) letters.

The tentative conclusion is that high school athletes tend to take up smoking, and so increase the number of athletes among college smokers, but that the smokers do not retain their preëminence in sports. This conclusion is supported by the fact that of students who began smoking in high school, 37 have high school letters, but of these only three have gained college letters by accomplishments in athletics at Antioch.

***Smoking and Physique***

Those who believe most firmly in the poisonous effects of tobacco commonly maintain that its use increases the speed of the pulse and alters blood pressure. There is some experimental evidence that in many cases these effects do follow immediately after smoking. If the speeding effect were permanent it would reduce the reserve power of the heart, and we should expect the athletic smoker to be handicapped by this loss of reserve.

Unfortunately for this theory, the average smoker's heart was found to be one-fifth of a beat per minute slower than that of the nonsmoker—probably a chance variation. We found no significant difference in the blood pressure or in the lung capacity of the two groups. If from one to six years of moderate smoking causes any permanent effect on the human machine, we have yet to discover it. If a moderate use of tobacco causes a temporary but not a permanent loss of physical efficiency in these respects, then the claims of those who oppose the use of tobacco must be modified.

***Smoking and Scholarship***

Of 23 men dismissed from Antioch last year for low scholarship, 20 were smokers. This fact bears upon all the following statistics. As the poorest students are dropped, the average grade of the remainder is higher. If most of those dropped are smokers, then the smokers remaining in college are a selected group who are less affected by the association of smoking with low scholarship. Were it not for such elimination, the scholarship of smokers would appear still more unfavorably.

On the basis of grading which prevailed when this study was undertaken, an average grade of 3.2 was required of students. A grade of 4 or higher was made by 23.9 per cent of nonsmokers, and by 7.9 per cent of smokers. The average grade of 176 nonsmokers last year was 3.51; that of 177 smokers was 3.14. The difference is .37. The mathematical probability of such a difference arising by chance is only one in 730 millions. The difference in scholarship of smokers and nonsmokers is real, with some assignable cause.

We cannot at once conclude that the habit of smoking is that cause. It might be a third factor. For example, sociability may be

(Concluded on page 26)

# MR. FORD'S PAGE

THAT of which men can say "we know" may be of large compass or small according to their definition of knowledge. When science makes the measurements of knowledge what we "know" tends to extend in quantity and diminish in quality. That is, the beliefs, the innate knowledge which has nourished the race for ages, does not meet the scientific test. And yet the *fact* that for generations and in all lands men have believed that they know certain things is itself a colossal item which science cannot disregard.

In the narrow sense men do not *know* that it is the destiny of humanity to make progress and leave behind one by one the difficulties of its ascent. Yet they believe it, else life would be less the adventure and lure that it is. Those who see a golden age behind and none before do not contribute much to life; their incentive is gone.

Now the fact that the wind is always blowing toward hopefulness, the fact that society as a whole never abandons the vision of something better farther on, the fact that successive blows and piled up disaster do not destroy their forelook, is something to consider. The question is not why men *should* expect better things; the question is why they *do*. That they do is a consequence of a law written in their natures; and that law is taken to indicate that fulfillment lies farther on. Man is not able, is not permitted to give up to pessimism. Pessimism is self-destructive, in principle, which seems to prove its essential outlawry in the universe. Men do not *know* in strict scientific method whether pessimism or optimism is the truth. But science knows that men's forward-looking, onward-going urge is one of the facts of nature.

It is when men turn their eyes from their vision to the actual realization of it that they make their nearest approach to skepticism. The goal so far; the road behind so short; the method of change so slow—at times, so overwhelmingly swift. And yet, succeeding upon every doubt, comes the wind again, blowing forward, filling men with the vitamines of hopefulness, the urge to progress.

Progress has its method the lines of which are found in progressive peoples. Peoples that have conceived the benefits of life as the rights of a class have achieved their rights to that extent, but having arrived there was nothing more to strive for, and the system thus motivated became obsolete.

Method seems important, because if the direction of progress is downward, then failure awaits those who assume that it is upward. In our day two main theories of progress are contending with results that are tending more and more to world-wide consequences. One movement contends for the leveling of all men down to the grade of the lowest man. Another movement contends for the leveling of all men up to the level of the highest man.

One is the revolutionary method which centers in Moscow and whose principal agents are of a definite breed; the other method is represented by the steady growth and progress of the liberty-loving commonwealths established by our own race.

The downward method is wrong, apparently, because it does not achieve even in partial degree its ends; there is an upthrust in the soul of man that defeats it. The upward method seems to be that of nature and destiny, because it is the one that takes root and grows, being fruit in wider liberty and fuller life. The more universally it is applied, the more evident its naturalness and wisdom appear to be. Level all men to the lowest degree, and there is no world. Level all men upward, and you have the world men have dreamed of and prophets have foretold.

Yet the level is not attained even by the upward method. The level never will be attained. It is not desirable; it is not possible. The higher the lowest man is permitted to rise, the higher the estate of all. In death, as in the downward method, all are equally low; in life there are varieties, all healthy, all fulfilling their destiny, but differing as tall corn differs from tall oaks.

If it were man's destiny that progress should be sought in the ooze and slime of reversion, evidences of progress would be found going that way. Wherever we meet progress, it is going the other way. The most colossal single failure in history has been the attempt to prove progress by descent. On the other hand, all the free commonwealths of the world are daily witnesses to the growth and fruitfulness of the attempt to prove progress by ascent.

The belief in progress seems to be irresistible.

*PHYSICAL necessity moves man to labor. Mental necessity moves him to reason. Spiritual necessity moves him to believe that life has a meaning, that the method of it is progress. The wind of destiny blows him ever toward a large hopefulness. It also drives him to see that his direction is upward. In terms of social advance this means that the method of social progress is not to equalize all men on the level of the lowest, but all men's freedom of ascent to the level of the highest. Equality by degradation has proved a failure; equality of ascending opportunity has lifted the world.*

## *Advice and Counter-Counsel*

BRITAIN shows considerable resentment of the intelligent and well-meant counsel given from this side, yet does not hesitate in the least to give advice to us. To cite: the Right Honorable Arthur Henderson, whom many expect to become Prime Minister should another Labor government be elected, has broadly hinted that American labor is behind the times in not following the British example in organizing a separate party. That is advice, it is probably well-meant, but it is not intelligent. American labor passed through that period long ago and has definite ideas regarding it.

Then there was Arthur A. Purcell, Member of Parliament, who advised the convention of the American Federation of Labor to "establish the closest fraternal relations with the organized workers of Russia." That also is advice, but it is not intelligent.

American advice to Britain has to do with basic things; get down to work; stop messing with ca' canny tactics and disputes about wages, and get into production; neither labor nor capital can ignore the fact of production, yet both are handling it in a way that will fling them into the ditch, if they do not soon mend their ways. That is the character of our advice to Great Britain—get rid of your obsolete machinery, get rid of your absurd bantam rooster notions of a labor fight; learn the A B C of supply and prosperity, that lowered cost of production increases trade, and increased trade means more wages, higher purchasing power, more widely distributed plenty—get out of the rut and you will employ your 1,300,000 unemployed and transform your dole beggars into self-supporting and self-respecting citizens.

There is perhaps no more backward employing class in the world than that of England, and the kind of advice that emanates from the United States is about as welcome to them as an alarm clock to a sleepy man.

The advice that comes back to us in reply indicates more than ever the profound need that exists for the kind of counsel that we have given. Mr Henderson talks politics. Mr. Purcell talks politics. Indeed, worse than politics—they advocate a caste system. A workers' party! A Peasants' Party, so to speak. Organize, not as American citizens, but as wage-slaves, they advise. That is the height of the wise suggestion made by the man whom fortune may make Prime Minister of Great Britain. He is not to be severely blamed, because he does not know, unless it be blameworthy in a public man to advise without knowledge of the facts. He ought to know that there is no caste system in America. Doubtless there is one in England, and it is one of England's greatest danger spots today, but there is none here. Mr. Henderson should have known that. As to Mr. Purcell, with his willingness to yoke the free labor of America with the low-grade peasantry of Russia, he was sufficiently answered by the President of the American Federation of Labor William Green—"We wish that our friend who so kindly advised us and offered us such frank suggestions might take back to the Russian Red International this message—that the American labor movement will not affiliate with an organization that preaches that doctrine or stands for that philosophy."

American labor does not feel itself a separate caste from the American people—it *is* the American people. American labor exercises its right to diversity in politics as in religion.

This exchange of advice between the two nations establishes: first, that neither of us likes to take advice; second, that American advice to England is more to the point and more intelligently aware of the facts, than is English advice to America.

## *Orators and Doers*

GREAT words from behind which not even the most efficient vacuum cleaner could extract an ounce of reality have upon some of us an amazing effect. We grow enthusiastic over booming noises from a decorated platform. Aroused by high-sounding piffle we seize meshless nets and chase imaginary butterflies across vacant lots, under the impression that we are really accomplishing something in the way of a great reform.

It is easy for most men to learn to thump the table and shout nonsense until they are purple in the face. A lot of them are doing it. And some of them are getting away with it. But once, *all* of them were getting away with it, and oratory was regarded as probably the most important subject studied at school. What is the cause of the orator's lessening efficiency? Why is oratory as a study losing cast? Why, because people are beginning to see that no matter how much orating is done, all achievements and changes that are *perma-*

*nent, decisive,* and *irresistible,* proceed in our time from the silent laboratories of chemical and mechanical engineers. Even in our most verbose days the United States never elected her orators to the Presidency. National instinct told us that orators were not doers.

Gabble flourished in Rome because—Rome had no industrial engineers. When we have enough of them, our ears will get a grateful rest.

## *Toleration*

IT IS not much of a word; it is not much of a quality. It belongs to the borderland of barbarism. Merely to tolerate is to give less than is due. Merely to be tolerated is to receive less than is just. The continued use of this word in public speech shows how really little thought has been given to the problem of living together in a democracy.

Everyone goes along with the President in his denunciation of religious intolerance. Though why he should denounce it is not clear, as the thing itself is not as prevalent in this country, nor as dangerous, as measles. Yet if the President were speaking of measles he would say "measles," but when he speaks of "religious intolerance," what does he mean? Whose intolerance? What religion in this country is intolerant? Even a Presidential word does not carry very far unless it defines.

The curse of this country is a mushy spirit of indifference that goes by name of tolerance. Everything is tolerated but the American thing. That is tolerated nowhere; it is attacked everywhere. And every plea for tolerance seems to strengthen the intolerance of American things which the preachers of tolerance (who are also the non-practitioners thereof) advocate.

Unfortunately for Mr. Coolidge, his preparation for office did not include a journalistic interlude. If it had, he would have learned that intolerance is not to be described by the adjective "religious" at all, for it mostly appears in minds in which religion has failed to "take." There are intolerant minds in all religions at present in America. "There are A. P. A.'s on both sides of the fence," said a Catholic priest. What every editor knows is this, that when he prints an article defending 100 per cent Americanism from attack, he is accused of being hand in glove with the Klan; and when he prints the story of a visit to the Vatican, he is accused of spreading Catholic propaganda and being an emissary of the Pope. An article on an economic subject by Father Ryan stirs up the A. P. A.'s to protest; and an article on immigration brings the bitter charge that it is all a conspiracy to bar Catholics from the United States. The Jew, of course, is found on both sides. Division among Christians is nothing for him to weep over.

The trouble seems to be that tolerance, or what we mean by that term, is preached over the fence, and not at home. More often suspicion is preached at home. Inside the camp, watchfulness is commended to the people; in communications between the camps, toleration is the theme. It won't work. It must begin at home.

## *Fooling With Our Money*

EXPERT experimentation with the money supply, evidence that the present system is not perfect, continues at Washington. This paper, in an editorial published several weeks ago, showed the folly of the Treasury war against the dollar denomination of paper, which is further sustained in the latest information from Washington, that an effort is being made to provide a composite dollar of gold and silver alloy which will replace its paper representative, yet avoid the weight and bulk of the silver cartwheel, and still be free of the fluctuations of exchange.

As to this last point, no mint in the world can perfect such a coin. Metal money is made a legal tender for debt at its face when within a certain "limit of tolerance," but must depend on its *actual weight* in all exchange. The most delicate processes and accurate machinery yet devised have utterly failed to produce coins of gold or silver of absolutely uniform weight, individually. A packet of gold eagles, as put up at the mint, will have the exact aggregate weight and the exact number of pieces, but may contain single coins of a variant weight of one grain of gold, the "limit of tolerance" being half a grain over or under weight; there may not be a coin in the packet of exact weight.

In international trade, coin money, when used, is calculated by weight alone, whether perfect, mutilated or sweated, the mint stamp being but a certificate of quality. On the other hand the paper note is a certificate of exact measure, if enough remains to identify it.

The idea of the composite dollar is not new, except as to its purpose. During the silver struggle in the nineties, the late James E. Scripps, founder of the Detroit *News,* suggested a compromise of the differences between mono- and bi-metalism by creating a standard money composed of gold and silver mixed in a legally established ratio of metal content.

The Treasury suggestion of a composite dollar is not impressive. Such a composition is practically impossible of achievement, and the result would be to add another token to our subsidiary coinage. To make a subsidiary coin the unit of our money system seems a strange proceeding.

# Railroads Grow Where Only Echoes Sprouted Before

## Civil Engineers as Civilizers

"Twenty years ago our town had water just as bad as that."

By C. F. CHRISTIAN
ILLUSTRATED BY RUSSEL H. LEGGE

IF YOU lived in a town where the drinking water looked like that, who would be your best friend, the D. D. who can preach a good funeral sermon, or the man who could strain the mud and bugs out of your water supply?"

The query drew the attention of a group of men to a glass jar filled with a liquid the color of turbid coffee. In the bottom of the jar floated a cloud of sand grains and flakes of slimy looking material. The jar rested on a bare table in an office on the campus of a Midwest university.

From this office after four years' training young men go out to tackle big jobs, with service as their ideal, and the right to add to their signatures the initials "C. E."

A dark-eyed young man spoke first from around the pipestem he held clamped firmly between his teeth. "Twenty years ago our town had water just as bad at that. Why, I can remember when we had to remove the water meters on the average of once every six months. We had what we called the septic room where the meters were opened and exposed to the sun until the stink of the angle worms, dead fish, and other filth had subsided enough to permit the men to clean out the instruments."

"If we had told the people at that time we could put a spring in every home that would deliver water as cold and clear and safer to use than that bubbling up from a natural spring, they would have called us crazy."

It was the "chief" speaking as he replaced an unlit "stogy" in his mouth so that he could hold the jar up to the light with both hands for examination.

Just than a newcomer stepped into the office. "Have a drink of home brew," the chief invited cordially. "R. C., there," indicating a man in stained khaki with a nod, "is just back from the highway camp on the river and brought us this sample of the natives' liquid refreshment."

The man who strains the mud from city water supplies, and makes railroads and highways grow where nothing more substantial than an echo ever sprouted before, is best described in the words of George Fitch.

"The civil engineer is a quiet man with a thick coat of sunburn who spends his time revising climates, editing the landscapes, and training up rivers into lives of usefulness.

"He is not generally known because he is not found on the street, in the club, or decorating grand opera with a vast expanse of white shirt front. He usually lives in the wilderness in hip boots and a last week's shave. After the average man lives several years in the wilderness his own mother wouldn't know him. But after the civil engineer has lived in the wilderness for the same length of time his own mother wouldn't know *it*.

"He is usually of small size. If he only used his own hands he could not push around a small creek, let alone a river. When he desires to move a mountain or wipe out a few hundred miles of desert with a dam he takes his logarithm book and retires to a quiet spot where he fills an acre of brown paper full of figures. At the end of six months he emerges with a carload of blueprints and motions for the steam shovels to come up and get busy."

"Why do folks know so little about the civil engineer or his work?"

The chief shot back the answer before the question was fairly uttered. "The better the engineering the less you see of it."

"Our work is all underground when the job is done," growled R. C. "That reminds me," grinned the chief. "I was down on the Isthmus when they were building the Gatun Dam. Congress had heard that the water was backed up for 30 miles behind the dam and they were anxious about the ability of the dam to hold all that water. They sent a committee of Congressmen down to look things over.

"The dam was being made in sections by hydraulic fills. One section of the dam would be pumped full of liquid mud and left to set while they built up another section. Vegetation grows so fast down there that a short time after the mud dried it was covered by a dense growth of tropical plants.

"The Congressional investigating

committee walked out along the row of hills and depressions that was the dam. After they had traveled some distance I heard this question asked by one member of the committee, 'Well, where is this dam, anyway?' "

Though politicians often furnish engineers with amusement, their denseness in technical matters ceases to be funny when the success of public improvements calls for imagination and courage in making appropriations.

The civil engineer thinks in terms of elevations and reduces all hills and valleys to one common denominator —height above sea level. The layman is apt to think that the hill he happens to be on is the highest within range of his vision.

"Here is a civil engineering job as big as the entire United States," burst out the chief as he drew from a case a sheet of paper about the size of a folded newspaper. "Colonel C. H. Birdseye, who carried an unbroken line of surveys through the Grand Canyon of the Colorado last summer, is in charge of mapping every road, every farmhouse, school, church, watercourse, and finding the elevation of all the territory in the country. It is estimated that this civil engineering project will cost $40,000,000.

"When it is completed for the country it will save county and state engineers many surveys for drainage and highway construction. You would be surprised to know how few persons, even engineers, know about these maps and use them.

"To drain a large swamp a county engineer in this state prepared plans based on a survey that covered only a limited territory. His work was accurate enough within the scope of his survey and called for a system of ditches costing $50,000.

"His attention was called to the maps prepared under Colonel Birdseye's supervision. In a few minutes we were able to show him on these maps how to lay out a drainage ditch that cost the taxpayers $5,000 instead of 10 times that sum.

"A druggist from the central part of this state toured through England in his car using the British ordinance maps to guide him. When he came back he wrote us to find out if there were any such maps of American territory. We told him to send to the United States Geological Survey for the quadrangles of his locality, as the sheets of the topographical maps are called.

"Shortly afterward the Director of the Geological Survey was dumbfounded to receive an order for 500 maps of the territory around the druggist's town. Investigation disclosed that the druggist was giving a map to each of his customers and was pointing out to them where their houses stood, who had the highest ground in the neighborhood, and where drainage water left their farms.

"They say that some of the farmers framed those maps and hung them in the parlor. That scheme surely dashed a lot of hopes based on the common belief that every hill of any size is the highest in the community."

"How many highest points are there in the state, chief?"

"About one a month," he chuckled as he bit off a frazzled end from his "stogy" and aimed it at the wastebasket. "Every time there is a new moon some one writes in here to ask if his house doesn't stand on the highest spot in the state. We have to break the sad news to him that there is only one highest spot, at Campbell Hill, near Bellefontaine, 1,550 feet above sea level."

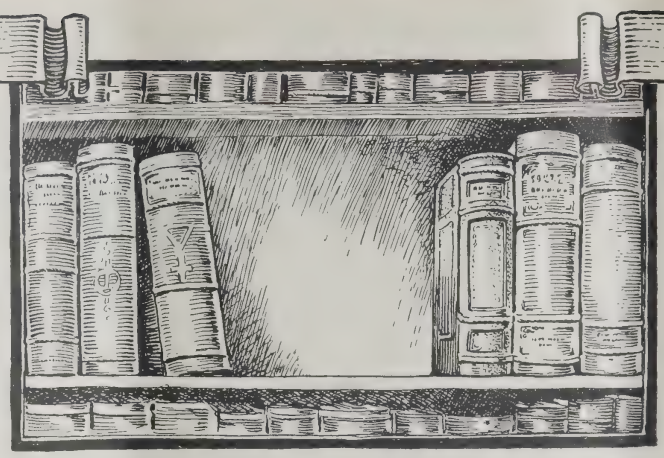
Topographical mapping, big as it is, is tame work in most sections compared with such spectacular feats as the construction of the largest cantilever bridge in the world over the St. Lawrence near Quebec. Eighty men lost their lives before the steel "K's" that form the trusses of that bridge crept out from towers on the north and south sides, over 1,800 feet of swift deep water, and gripped each other in the center of the suspended span.

"Measured in terms of lives lost I suppose the Panama Canal is the biggest undertaking engineers ever tackled," ventured the chief as he glanced at the men in his office to catch nods of approval. "The Americans had to organize mosquito police. Why, if you found a mosquito in your house you called a policeman who came and bagged the yellow fever carrier as our police would round up a burglar. Americans cleaned up the Isthmus, changed the name of Monkey Hill, where thousands of laborers were buried during the French occupation, to Mount Hope, and made the Atlantic and Pacific join hands in the face of sanitary odds that were overwhelming at the outset."

"Some of the farmers framed these maps and hung them in the parlor."

"What is the biggest piece of civil engineering in the world?"

"That is about the hardest question you could ask," he said after a long pause. "You might rate civil engineering accomplishments on the basis of the good they have done human beings. Using this standard I guess the Assuan Dam on the Nile is the biggest thing that civil engineering ever did for the world." R. C. and the young man with the pipe nodded assent.



When the British took control in Egypt they found the richest agricultural region in the world periodically suffering from starvation because the Nile floods failed to provide enough water every season to irrigate the fertile valley and delta which has been the granary of the Near East since Biblical times. Droughts similar to those that caused seven years of famine in Joseph's time persisted until Sir William Willcocks threw a dam across the Nile and stored water in a lake 180 miles long.

Assuan Dam is a great engineering feat in addition to being the salvation of Egypt economically. It is more than a mile long, 6,200 feet. It is designed to permit enough flood water to pass in one day to cover the State of Delaware to the depth of six inches and leave thousands of gallons to slop over the edges of that state.

"Chief, that almost makes me believe that the civil engineer is doing as much or more for civilization than the preachers."

"I wouldn't say that. It wouldn't sound well coming from a civil engineer," explained the chief, but the little wrinkles around his eyes betrayed his amusement. "I might quote something one of our state's foremost citizens said after he had made a trip around the world.

"He told me that when he reached India he was looking for evidences of British exploitation of the natives. He admitted frankly that he was no lover of English methods of colonization. But he said: 'Missionaries had a free rein in India. The British denied no church the right to establish stations in India. Meanwhile the British are going ahead constructing waterworks, digging sewage systems to rid the cities of the scourges that breed where filth abounds, and, I believe, they are doing more to Christianize India than all the missionaries.' "

There Is a Vacancy on the Wide Shelves of Public Libraries

It May Soon Be Filled by Some Books That People Will Read

# The Open Segment

By NOLAN R. BEST

PERSONS who keep an eye on the signs of the times with zeal to discover tokens of religious interest rising in the world today should not overlook the shelf of religious reference works in the typical American public library. They will find well-worn books, and they will not mistake the significance of that. Americans today are asking many questions about religion, and authorities that can answer such questions, whether by print or voice, suffer no lack of attention.

On this religious shelf in the reference room two works are today conspicuous. They are, in the numerous volumes of the respective sets, massive and imposing—to some persons perhaps forbidding, for they do outwardly look learned. And, indeed, inwardly they contain plenty for readers to learn who have a wish to learn. But their air is the air bespeaking the teacher who diffuses knowledge—not the pundit who haughtily preserves it. They are books made to meet the minds of people who want to know about religion—who wish to satisfy themselves in regard to its teachings and to measure intelligently the mass weight of its influence in the world. And it is happily possible to speak thus in common terms of the character of both works despite the fact that they originate in highly contrasting precincts of religious faith. Both sets of books are religious encyclopedias. The earlier is the Jewish Encyclopedia; the other, its near successor in point of time, is the Catholic Encyclopedia.

The fair-minded observer, however, looking at these two great productions in the religious field, will be instinctively conscious of a vacancy beside them. The combined scope of these two great encyclopedias does not encompass the whole circle of thought and faith among religiously interested Americans. The Protestant element in the religious life of the United States still remains for authoritative statement of history and belief. If, therefore, as is cheerfully conceded, it is worthy loyalty which has prompted the sons of Rome and Judea to exalt, by the impressive means of great encyclopedias, the religions that respectively command their allegiance, it is equally befitting for Protestant religious leaders to fill up the open segment of this religious circumference with a Protestant Encyclopedia. Such an enterprise is already well afoot. A third companion will ere long be on the library shelf where the two previous works now stand.

The spirit animating this effort is not a spirit of contradiction or controversy. On this matter a good precedent is already set. To the praise of both the Jewish Encyclopedia and the Catholic Encyclopedia which have blazed the way for this new sort of religious literature, let it be said that calumny against other religions has no place in either of them. And, of course, the Protestant editors will not be outdone in that chivalry. Catholics and Hebrews have told their convictions affirmatively, testifying to their own ideals of truth, without disparaging the beliefs or impugning the sincerity of such as follow conscience by another road. They are frank advocates of their own tenets but pass no judgment on the tenets of others. And every Protestant of well-balanced mind must be instinctively conscious that any other attitude in the making of a Protestant Encyclopedia would betray a weakness inconsistent with Protestantism's real spirit.

When, therefore, these three religious encyclopedias stand side by side on the same shelf in American libraries, public and educational, they will not symbolize bigoted rivalry among men and women of diverse faiths. Rather they will be signs of bigotry being supplanted and overcome by that generous temper which, without abating a jot from its own testimony to truth according to its own understanding, is able to exercise an unbegrudged tolerance toward all persuasions of belief and preferences of form under which its neighbors worship God. Only in such tolerance of religious contrasts can American ideals be realized for the spiritual freedom of the individual soul in a complex society. And it particularly lies on Protestants, who have stressed the individual's independent responsibility before his Creator, to cultivate and exemplify the toleration that pays respect to all honest religion, regardless of the forms in which it appears. To that sentiment the Protestant Encyclopedia is prededicated. If it at all fulfills the avowed intent of its projectors, the Encylopedia will be an educative force, advancing the spirit of religious peace by its own practice of the conjoined virtues of positive faith and all inclusive charity.

But will the Encyclopedia be educative—educative of the prevalent mind in the rank and file of the various Protestant denominations? This question implies a doubt very much more extensive than the sphere of the churches. It really signifies a question whether encyclopedias are ever educative. The common impression of these many-volumed storehouses of knowledge is that they are dismal domains in which none but a confirmed and utterly leisured bookworm would ever have either disposition or time to burrow. But this idea should be taken for comparison and judgment to the light of some professional librarian's experience. What sort of people really do read the encyclopedias of the public library's reference department is information which sets at naught the notion that such books are used only by the loftily educated or the impossibly dull. Very practical folk and very busy and energetic folk, too, find their way to knowledge through the great pages of the encyclopedias. And if this is the fact in secular lines, there is no reason to doubt that it will be the fact about the religious encyclopedias—is even now the fact regarding those already published and in use.

The copies of the Encyclopedia which will certainly go into the public libraries will not represent its whole circulation. In reality that distribution will constitute only an outer fraction of the field it will cover. There will be sets of the work in thousands of ministers' libraries; it will find a place

in a multitude of laymen's homes besides. It will not be missing from the libraries of any of the colleges maintained under church auspices, and most other institutions of learning will possess it also. Moreover, in a comparatively short time, it should be found in the libraries of the majority of well-organized local churches. It will be a part —as the two former encyclopedias are —of every newspaper's reference library.

It is the vision of this wider use which will, I believe, be the most effective of all guaranties that the editors will not succumb to any of the snares of pedantry. Nothing written for mere display of learning, if the editors could so be tempted, would stand on the Protestant Encyclopedia's pages in face of the reminder that the volumes will find perhaps their largest use in the instruction of young people of high school age and college age. There is no lack in Protestantism more obvious than the general failure of religious education to make boys and girls entering the church understand how mighty an allegiance they are taking on themselves. Far too commonly these young folk are only conscious of entering into fellowship with the group of neighbors constituting their local congregation. And they are but little better off when they realize their association with that much more numerous company who bear the same denominational name. It is only when the young candidate for church membership appreciates the age-long story and the world-wide sweep of the universal church of prophets, apostles and martyrs — the mighty line of Christ's legions stretching through the centuries—that the solemn meaning of being a Christian can fully grip his soul.

***Something Useful to the Average Person***

To reveal these heroic dimensions of the Christian calling a sound training in church history is indispensable. Plainly the progressive church school must add to its Bible curriculum for its older scholars a larger education in the annals of the church. And whatever textbook is used for that purpose, the Protestant Encyclopedia will be invaluable—virtually indispensable—for that stimulus of collateral reading which in all secular education of corresponding grade is regarded as necessary to keep textbook work from becoming perfunctory. Thus will be furnished vivid human touches to enliven the dry bones of names and dates. To be sent to "read up" on a great character in the story of Christianity warms an interest which at any time may transform a plodding and unconcerned student into a soul athrill for heroic service. To these ends—as well as others of practical value to the makers of sermons and to both clerical and lay leaders of church activity—the Protestant Encyclopedia will be helped by the examples of its predecessors who, though not unmindful of scholarship, have not feared to be popular —meaning "useful to average people."

***The American Encyclopedia of Christianity***

The manner and method of putting forth this Protestant work are in debt in some particulars to the plan adopted for the Catholic prototype. That was not promoted as a commercial enterprise, but through a special publishing organization which became recognized as a quasi-church agency. With this advantage a work which, according to the estimates of professional bookmen, had practically no chance of reaching a distribution of 10,000 sets, has been sold in almost eight times as great a quantity as was thus marked out as a maximum. This Protestant undertaking, therefore, should not be thought of as a book exploitation, but in its real character as a great training project for the whole church, reaching out into its broad missionary field as well as the field of what is more strictly called religious education. In this aspect the freely given aid of the churches is expected to promote and extend its usefulness far more widely than sheer commercial methods could accomplish. For the sake of this great advantage, a group of eminent American churchmen, standing high in influence in a variety of denominations, have united to create the American Institute of Christianity, a nonprofit corporation, forbidden under the laws of New York to make money for itself. Under this organization the editorial preparation of the Encyclopedia has already begun, and the recognition of the effort is happily extending daily to new circles and bringing forth new coöperation.

Though the informal title, "Protestant Encyclopedia," is commonly used by the friends of the undertaking, it has been determined that the formal name of the work shall conform to the name of the Institute; it will be published as "The American Encyclopedia of Christianity." This will counteract any possible impression that the editors contemplate dealing with Protestantism alone; all forms of Christianity, West and East, will be recognized as within the universal Church of Christ.

Judge Henry Wade Rogers, eminent in the Federal judiciary, a Methodist, is president of the corporation. The chairman of the board of directors is Honorable Carl E. Milliken, war governor of the State of Maine and for the year past president of the Northern Baptist Convention. Vice-presidents are Dr. John A. Marquis, secretary of national missions in the Presbyterian Church, and Dr. Joseph Cullen Ayer, professor of church history in the Protestant Episcopal divinity school at Philadelphia. There has already been organized also a board of editors in which the equilibrium of denominations and theologies is even more interesting. Dr. Ayer is chairman. The secretary is Dr. William W. Rockwell, church history professor in Union Seminary, a Congregationalist. Their associates are Dr. Frederick W. Loetscher, of Princeton Seminary, Presbyterian, likewise occupying the chair of church history; Dr. Charles M. Jacobs, of Mount Airy Lutheran Seminary, also a church historian; Professor W. H. P. Hatch, of the New Testament chair in the Episcopalian divinity faculty at Cambridge; Dr. Benjamin W. Bacon, who teaches New Testament in Yale divinity school, another Congregationalist, and finally the only non-professorial member of the board, Dr. Henry H. Meyer, editor of the Sunday school publications of the Methodist church, to whose care will no doubt be intrusted those adaptations to Sunday school uses which have already been pointed out as a specially interesting feature of the Encyclopedia.

***Half the Board Specialists in Church History***

To initiates in ecclesiastical mysteries there are in this list several significant tokens. One is the collocation of Union and Princeton seminaries. These two schools have often been in conflict on doctrine and church law; their joint interest in this enterprise is therefore the most outstanding guaranty that the forthcoming Encyclopedia will not lean partisanly to any church faction. That half the board are specialists in church history is further assurance to the same effect. Better than other men they know how divided opinions have marked the whole progress of the church from the days of the apostles until now, and the essential business to which they are trained and habituated is the just interpretation of all the divergent views that mankind has held about religion. This certainly makes them the essential kind of men to dissipate the fear that any touch of injustice toward any man's scruple or conviction or interest may mar the honest impartiality of the work.

# Romantic Rascals

## Jorgen Jorgenson, 1780-1844

(Eleventh of Series)

By CHARLES J. FINGER

CAREFUL Copenhagen parents sometimes warned their sons against too close companionship with Jorgen Jorgenson because of his reputed wildness. Yet he was a favorite everywhere, there was a fund of wholesome laughter in him, and any company was the brighter for his frank and happy face, his ready smile and his steel-gray eyes. Then there was no malice in his wildness. It was the wildness of a physical energy that overflowed, an energy that could hardly find expression. Could Jorgen Jorgenson have had his way, he would have leaped back in time, out of his year of 1794, and into far-off days when Vikings sailed the seas to discover new lands, Iceland and Greenland. Back he would have gone, out of a prosaic life and into the days of Ingjald, and Hrolf, and Ingolf, when men were fearless, when youths knew the play of sword and shield and spear, when men outfaced their foes and fought hand to hand, and war was no dreary affair of hiding from fire-belching guns.

Because of that passion for life vivid and free, there was a day when a party of lads, all straight-limbed and strong and active, spent a day out in the wind on the seashore, in mock battle with bows and lances, when they should have been sitting in serious study in classrooms. The end of that was Jorgen's expulsion from school, for when the trouble broke he stood up and declared that, having been the leader, the wrongdoing was entirely his. But he was forgiven soon after, when the town of Copenhagen took fire in the year 1795. Fifty streets were laid in ashes that June day, and when the flames touched the arsenal with its dangerous contents, and men and women fled in panic, down came a band of boys, Jorgenson at the head of them, and the lads fought fire with the fierceness of warriors, their axes crashing through walls and doors, themselves heedless of the smoke and flames that threatened them, valiant and stubborn until the battle was won. To show good will, the citizens offered the wild lad some quiet place in an office. But he laughed joyously and thanked them, saying that on the next day he would sail on the good ship *Agnes*, and would be out of the harbor before city people were out of their beds.

He was then in his sixteenth year, though looking older because of his build, being square-shouldered and well-muscled, and for the next few years he had for his music the tumbling spray, and the washing waves, and the whistle of the wind in the rigging. They were vivid years, adventurous years, wild years during which he grew to manhood under the Southern Cross. Sometimes he was in the antarctic on whale-hunting ships, beating about among ice floes and great bergs. Again he found life full and free in the neighborhood of Cape Horn, catching seals and otters and walrus. That led to inland adventures in Patagonia, to hunting wild horses which he sold in Chile and Argentina, to rhea chasing for the feathers and huanacos for their hides, now and then to expeditions into the Andes for Inca treasure. Tiring of South America, he sailed among the Polynesian Islands with a party of nondescripts from odd corners of the earth, men curiously hungry for treasure who tried to trade off useless stuff to the natives for things that would bring high prices in northern markets. After that he wandered in tropical jungles in Borneo, Sumatra, Burma, going here and there because of tales told of guarded temples where were gold, rubies, gems, and strange idols with precious stones in their heads. At last he shipped to Madagascar by way of Ceylon, from there to the Cape of Good Hope, then to the Gold Coast, and so to England. That was in 1807.

Then he found difficulties. For Napoleon had paralyzed the commerce of Europe and nations glared at one another in hate. Everywhere was discord, anger, unrest among the civilized nations; everywhere there seemed to be expectant war and physical and moral confusion; everywhere people were hysterical about victories and conquest, and church dignitaries were blessing the banners and armies of kings and emperors. But all that at first seemed to concern the adventurous Jorgenson not at all, and for some days he fraternized happily with English sailors in Shadwell and Limehouse, until he learned that England and Denmark were enemies. That was when someone who heard him speak of Denmark called him a spy. By way of emphatic denial he knocked his insulter down, then suddenly realized that every Englishman was supposed to be his foe, though, personally, he had not the slightest quarrel with any man from Land's End to John O'-Groats. However, the doings of princes seeming to involve him, he made his way to Copenhagen, and, before a month had gone, was second in command of a brig.

Before his ship cleared, trouble came. Into the harbor's mouth sailed a British fleet under Admiral Gambier and Lord Cathcart, and for three days iron death poured into the town. The lives and happiness of households were destroyed, and people fled from unknown dangers; the quiet geniality of the daily life gave way to the fury of battle; destroyers of patient industry were busy everywhere, and soon guns thundered from forts and ships, half of the city was on fire and happiness seemed to have fled. Then came the seventh day of September, 1807, when, to save her people, Copenhagen surrendered and eighteen sail of the line, fifteen frigates, six brigs and twenty-five gunboats fell into the hands of the invaders. But not the brig on which Jorgen Jorgenson sailed. That escaped, slipping past the English lines in the dark of night to become a North Sea rover. Somewhere on the Norwegian coast there was a hiding place where the water was six fathoms deep close to the land, a landlocked water with a narrow opening between cliffs; from that secret harbor Jorgenson's ship dropped out when the tide served, darting down on fishermen,

capturing a boat here and a schooner there, once making a daring attack upon a frigate within sight of Flamboro Head. But a lucky shot from the Britisher brought down the Dane's foremast, the brig was boarded, and Jorgen Jorgenson soon found himself in a Thames-side prison with nothing ahead of him but months of weariness.

But somehow the adventurer possessed the driving power and the appeal. Bluff and unaffected, men liked him, listened to him, trusted him. So, before long he was out on parole and mixing with men, hinting now and then at some high and splendid secret. His captors left him very free to go about as he pleased.

One day, in a tavern near Temple Bar, he fell in with a wealthy city merchant named Samuel Phelps, owner of the brig *Clarence* and financially interested in other ships. There was an hour of talk, during which Jorgenson weaved his magic spell, secure in the knowledge that commerce and war went hand in hand and that none were so loudly patriotic as those with a taste for profiteering. So the adventurer told Phelps of great opportunities in Iceland, Denmark's foreign market. He told of people starving because of the war and England's blockade of the seas; told him that the dead were being buried without coffins because of the lack of lumber; told him that sea water was being used instead of salt, that there was neither flour, nor sugar, nor iron in Iceland. He wound up by saying that the island storehouses were bursting with fat, and tallow, and oil, and wool, all of which England needed, while the things that the Icelanders lacked, London and Mr. Phelps had to spare. The end of it was that the *Clarence* sailed for Iceland under the command of Captain George Johnson, and Jorgenson, refusing to anchor his conscience to a responsibility, was on board as interpreter. In due time they dropped anchor at Hafnarfjord.

At first the Icelanders refused to trade with Denmark's enemy, but what with Jorgenson's urbane compliments to the *stiptamtmaor* Count Trampe, and his veiled hints to others that Captain Johnson might bombard Reykjavik the capital, the cargo was landed and trading commenced. Then, on March the twenty-second, 1809, the *Clarence* sailed for England with Jorgenson on board and James Sevignac left in charge of trading operations.

Without the radiant Jorgenson, things in Reykjavik did not go so well. To carry on the business by means of all those arm-wavings, and gesticulations, and strange contortions which went by the way of sign language was difficult, and, to make matters worse, Count Trampe had his suspicions that English notions of value and exchange were too elastic, so deportation soon faced Savignac and his men. But a warship, *The Rover*, chanced to drop into port, and its captain smoothed things over for the time in quiet and unobtrusive manner.

Still, Count Trampe had sown his storm and the spirit of the whirlwind had its eye on him. That spirit came in the person of Jorgen Jorgenson who had persuaded Phelps to fit out a second expedition, an armed merchant ship called the *Margaret and Anne*, on board of which was the merchant himself. Jorgenson, with joyous exultation, flung himself into the Trampe-Savignac trouble, and, at the head of a band of sailors and discontented or adventurous Icelanders, marched into town, seized the Count, seized his ship the *Orion*, seized the town itself. Then he was happy. Power and adventure faced him and it was no cloud on his happiness that officials proclaimed him outlaw. A country to govern lay before him and he would be Jorgenson the First of Iceland. He designed a flag—three white codfish on a blue field. Then he proclaimed himself Protector and Commander on Land and Sea; promised the institution of trial by jury; talked about schools; declared that all debts to Denmark were null and void, and had the felicity of seeing and hearing a salute fired in his honor by the *Margaret and Anne*.

With a ragged army carrying old guns, scythes, spears, swords, and sledge hammers.

Then came occupation and subjection. With a ragged army carrying old guns, scythes, spears, swords, sledge hammers, Jorgenson marched north, planting his flag and challenging any to oppose him. He was a warrior lord big with optimism and full of joyful and generous hope to set crooked things straight and to right wrong.

The fall was as swift as the rise. Returning to Reyjavik he found the British warship *Talbot* in possession. The fort had been thrown down and the guns were at the bottom of the sea. There had been trade agreements, and Master Phelps, being safe commercially, treated Jorgenson's aspirations with levity. As for the little army, it melted away, and when a file of British marines arrested the Commander, there was never a one to say a word or to strike a blow. So Jorgenson was led away handcuffed, and placed on board the *Orion* which was ready to sail for England in company with the *Margaret and Anne*, both ships being laden to the line with oil and tallow.

But the *Margaret* (Concluded on page 23)

# Salt—A Rare Utility

## Nature Provides an Ample Supply; Man Refines It and Devises Over a Hundred Ways to Use It

By GORDON W. KINGSBURY

WHEN you ate your eggs for breakfast, flavored your soup at dinner time or seasoned some delicate morsel of food on another occasion, did you ask yourself: Why did I use the salt? What is this thing called salt? Where does it come from and what is it good for?

The beginning of the use of salt in food is lost in prehistoric time. It is well known that animals will travel for miles to reach a salt well or the seashore and as one author pertinently remarks, "Man had but to follow them."

There existed in ancient times, and may still exist, residents of Asia or Africa who do not add salt to their food but this is explained by their food being almost exclusively of animal nature. Their food contains all the salt they need. The absolute necessity of common salt to the life of the animal organism makes quite unlikely the possibility of any ancient or modern people existing without it. With the gradual change in man's social development from the status of hunter and shepherd to the settled life of the tiller of the soil, the food changed from animal to a more or less vegetable diet; and with this change desire and need for salt increased.

Scientists say that we would quickly starve to death on food that contains no salt even if it were otherwise 100 per cent nutritious. Salt is essential to the formation of gastric juice without which there can be no digestion. In addition to being an aid or factor in digestion, salt is a purifier of the blood and a preventive of disease. Historians lay the great ravages of disease during the Crimean War to a deficiency in the salt rations of the warriors. Today, as of old, men eat salt for two purposes: First to aid digestion and second to prevent disease.

Six hundred feet "down" in a Louisiana salt mine These huge arches are 65 feet high.

Of the millions of persons who daily handle salt, few have any conception of the important part which common salt has played in the history of our race and of the great place it fills in modern economic life.

Salt is to most people but a simple condiment, yet wars have been waged for the possession of a salt well: the sites of towns have been decided by the proximity of the mineral; the trends of great roads have been bent for easy access to the regions of salt. Archeological investigations have shown that Nauheim, Salzungen and other salt wells have been the scenes of fierce combats for their possession.

As salt has been the cause of strife, so it has also been the means of deciding wars. History records that the Sellasians in the Illyrian war were forced to surrender to the Romans through want of salt; and the Circassians submitted to the Russians for the same reasons.

The French in Metz, during the siege of 1870, had to adopt a very elaborate but interesting method of manufacturing salt, to obtain for the army and the inhabitants this necessary factor for their health.

It may truly be said that in ancient times salt influenced human society as much as gold does at present; and, indeed, at some periods and in some places salt has been used as the medium of commercial exchange as gold and silver are now. Roman soldiers were at one time paid in salt, hence the derivation of our word *salary*. By interpreting these habits, customs and writings of ancient people we find that salt was considered an article of value and always held in great veneration.

Salt is a mineral and like other minerals it comes chiefly from deposits located beneath the earth's surface. Chemically it is a compound composed of two elements, sodium and chlorine. Its chemical name is sodium chloride. When separate and taken internally the elements which compose salt are poison, but when combined and used properly they assist to sustain life.

Probably nothing unless it be water is used more extensively by all civilized people than salt. Nature provides it for us in three forms: first in sea water in solution; second, in salt springs; and third, in the form of salt rock. From time immemorial man has obtained salt from sea water. This is still being done on our seacoasts and on the shores of Great Salt Lake.

In some parts of the world it has

Plowing salt near Great Salt Lake, Utah.

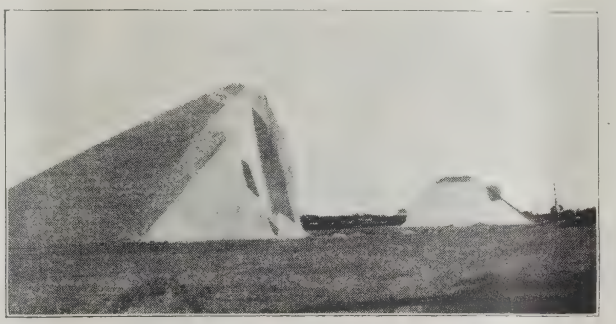
been possible to obtain a large supply of salt from what are known as salt springs. These springs are usually the result of water flowing over a deposit of salt rock and the amount of salt obtained from evaporating the spring water is so small that salt springs are an impractical source of salt supply for commercial purposes.

Rock salt forms the most common and practical source of our salt supply. Large quantities of salt rock are found in all parts of the world and reasonably near the surface of the ground. These deposits, the geologists say, are what is left of ancient salt seas. In the United States the largest deposits of salt rock are found in the States of Michigan, New York, Ohio, Utah, Louisiana, Kansas, Texas and California. According to Federal statistics, these states are the largest producers of salt in this country.

The largest source of salt supply in Europe is at Wielzka in Poland. This deposit of salt is said to be the largest in the world, the bed of salt rock being 500 miles long, 20 miles wide and 1,200 feet thick.

Some of the salt mines in Poland are so extensive that it is said some of the miners spend all their lives in them, never coming to the surface of the earth. Most of the deposits of salt rock contain impurities which need to be removed before the salt is fit for use commercially; however, some deposits like those in Louisiana show a very pure salt rock and when ground up this rock salt is suitable for table use.

In general, however, the salt made from crude salt rock is only fit for the most ordinary commercial uses. The most common impurity is gypsum and it is necessary to remove this gypsum before the salt can be considered pure.



The usual way of obtaining salt from the earth is by means of salt wells. These wells are drilled in the same way that wells are bored for oil and gas. A pipe about six inches in diameter is lowered to the surface of the salt rock and then an inside pipe is put down, water is forced down between the two pipes and the pressure exerted brings up the dissolved rock or salt brine through the inside pipe. After the salt brine reaches the surface, the salt is extracted from it in various ways.

At present the crude open-pan system, where the brine was poured into open pans and fires were built below the pans, is almost obsolete. The most practical methods of refining salt today are known as the Grainer, Vacuum Pan and Alberger systems.

The Grainer system is similar in its operation to the old open-pan system, the heat being applied through steam pipes inside of the brine pan.

In the Vacuum Pan process tiny cubes of salt are formed and settle to the bottom of the pan in which a vacuum has been created. The salt is then drained out and is ready for drying.

The Alberger system of salt manufacture is a mechanical process which subjects the salt brine to a high temperature and removes the impurities by means of mechanical filters.

You have heard of icebergs. Here is a new one—a "Salzberge" in Cadiz, Spain.

According to recent government reports it is estimated that the average consumption of salt per capita for all purposes is about *one hundred pounds a year*. Each of us consumes from five to fifteen pounds a year on the table. Some medical authorities say that this is too much, while others point out that the human organism is entirely capable of rejecting a surplus of salt and that trouble is caused by an insufficient supply more frequently than by too much.

The salt we take into our systems aids digestion. Food that is improperly salted does not taste well and appetite is a barometer of what the system needs.

Salt also assists in the formation of red blood corpuscles and helps them in the absorption of oxygen, thereby stimulating normal body functions and tending to restore and maintain the body in a normal healthy condition.

But these are physiological functions; what are the usual and unusual uses of salt?

A study of the uses of salt brings out the fact that in industry the largest consumption is in the preparation of food products.

The manufacture of breakfast food, churning of butter and the curing of bacon; the preparation of sausage, sauerkraut and canned vegetables—these require enormous quantities of salt. Salt is also used in making glass, in the manufacture of dyes, in the operations of bleaching and preserving. Salt is also used in the flavoring of chewing tobacco. Commercial engravers use it in the preparation of high-grade half tones.

Great industries thrive by breaking up the sodium and chlorine found in ordinary salt. The soda forms the basis of a wonderful cleaning compound and the chlorine, which was in demand for gas production during the war, helps to bleach cloth in times of peace.

It is curious to note the many uses for salt in the everyday affairs of the average household. It has been said that there are more than a hundred different ways to use salt. In the sick room it has few equals. It relieves dyspepsia, is unequaled for nasal douches; dentists recommend it as a dentifrice and it has been known to cure a felon. Salt when properly used will relieve earache, toothache, aching feet, a sore throat and do wonders in relieving distress from burns, bee stings and insect bites.

There is a barber in Ohio who says he can cure dandruff and grow new hair on a bald head by means of treatments with pure salt.

Almost any housewife will tell you that salt is a great preservative. It is indispensable in the making of pickles: it keeps eggs, and preserves the color in boiled vegetables.

In the summertime salt can be used for making ice cream and in the wintertime it can be used to remove the ice from the sidewalk.

As a deodorant it removes the olfactory offense of onions from knives and cooking utensils, and being burnt it overcomes burnt odors from ovens and stoves.

Some housewives claim that salt will prevent milk from souring, make eggs beat quickly, prevent fish from sticking to the pan, improve the flavor of tea, coffee and cocoa, prevent cakes from burning and make cream whip rapidly.

As a cleansing agent salt has remarkable properties. It will remove stains from china and earthenware, take out grease, soot and ink stains from carpets; clean bamboo furniture and restore to whiteness sinks, drains and bathtubs.

Today the salt industry of our country is on a stable basis.

Some countries make the production of salt a government monopoly and in China they count the population by the amount of salt consumed.

A most recent development of the salt business in the United States is the request made by the health authorities of Michigan of the salt manufacturers offering salt for sale within that state, that they treat their product with iodine.

A study of the prevalence of goiter in certain sections of Michigan traces the difficulty to the lack of iodine in the drinking water. The use of salt as the most effective way of distributing the proper amount of iodine is a flattering compliment to the universal utility of this so-called common commodity.

No human beings have ever existed without a certain amount of salt.

# The "Signers"—

## Some of the Men Risked All They Had

By CARL
(Copyright, 1925, by

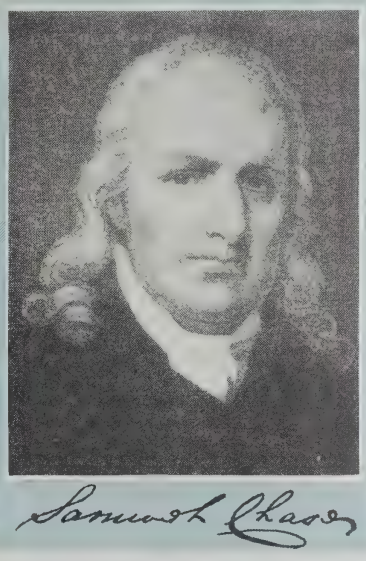
ON THAT memorable second day of August, 1776, when the Declaration of Independence was signed at Philadelphia, a certain rich man did not hesitate to do his full duty. As Charles Carroll wrote his name almost as plain as John Hancock's, which the king might read without spectacles, somebody exclaimed:

"There go a few millions!"

"What are millions?" the man from Maryland asked. "Neither my millions nor my writing will settle this just cause, but the bayonet will."

John Hancock, pursuing the fashion of real Americans, contributed a remark. Having observed that the Maryland leader had finished, he suggested:

"There are many Charles Carrolls, and the British may not know which one it is."



"Quite right," the signer agreed at once. "Let there be no doubt. There is only one Carrollton." Then he added the telltale words, "of Carrollton," for the purpose of sure identification.

More than three centuries ago Shakespeare said that some men are born great, some achieve greatness and some have it thrust upon them. Into the first category Charles Carroll might be placed, for he got a portion of his greatness by virtue of birth. However, like the scores of successful men of all times, he achieved much through sheer merit and willingness to work assiduously.

Charles was sufficiently astute to "marry wisely and well," as gossips say. He waited until he was thirty-one when many of his friends were wondering about his bachelorhood; then he suddenly "kicked over the traces" and wedded magnetic Mary Darnall who came of an ancient family or lineage, had beauty and a fortune.

But this lucky man did not "take it easy" as he might have done. When the colony, founded on the basis of religious tolerance and equality, proposed to override this principle, it was Carroll who picked up his sturdy pen and vigorously fought the movement. Under the name of the "First Citizen" he prepared a series of newspaper articles in which he presented his arguments so clearly and forcefully that they were not disproved. When the people finally learned that he was the author of the truly masterful expositions he immediately became a foremost (if not the first) citizen indeed.

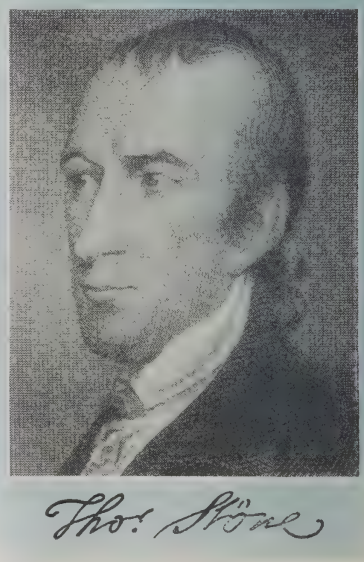
When war with the mother country appeared inevitable, this famous son of Maryland received an appointment on the Colony's "Committee of Correspondence" which proceeded to set the stage for the coming conflict. He was also accorded a place on the Council of Safety (a progenitor to our Council of Defense during the World War) and in 1776 he was named a

Samuel Chase

member of the committee that sought to gain Canada's coöperation with us against Great Britain.

But Maryland sent the wealthy Charles and the other delegates to Congress with instructions not to consent to independence until they obtained her approval. As Carroll did not relish this arrangement he made strenuous efforts to swing the colony into line. Largely due to his skillful persuasion, together with that of Samuel Chase, Thomas Stone and William Paca, the assembly meeting in June, 1776, reversed its previous instructions and urged its representatives to do all in their power to make the "united colonies free and independent states."

This able patriot was no shirker. He served on the Board of War. He was a member of the committee that visited Valley Forge to investigate various complaints which had been lodged against General Washington for his supposed lack of military strategy. In 1788 Maryland elected him as her first Senator under the National Constitution. He retired to his manorial home in 1804; then, after a rest period of twenty-four years, he laid the cornerstone of the Baltimore and Ohio Railroad, the first great railway system in this country.



From the fourth day of July, 1826, which marked the passing of Thomas Jefferson and John Adams, until his own departure six years afterward, Charles Carroll calmly enjoyed the dignity of his position as the last survivor among all the signers of the immortal Declaration.

J. H. B. Latrobe, who wrote the life of Maryland's grand old man, said that the venerable patriot listened closely to the reading of the manuscript. He made no comment until the author reached the end when, after a pause, he frankly and humanly observed:

"You have made a much greater man of me than I ever thought I was. And yet you really have said nothing in what you have written that is not true."

His biographer pictured him as an attenuated old man with a prominent nose and a receding chin, small eyes that sparkled when interested, small head, white hair and a wrinkled face, but with manners and speech of a courtly gentleman. He would have made a fine study for a physiognomist because such features as beady eyes, small head and a receding chin are not usually found in men who attain some degree of enduring greatness.

Samuel Chase, one of his colleagues, was much more of a Beau Brummel than Carroll. He possessed a lofty stature, a well-proportioned figure, a handsome countenance, a vigorous body and a fiery soul. A friend aptly described him as moving "with a mob

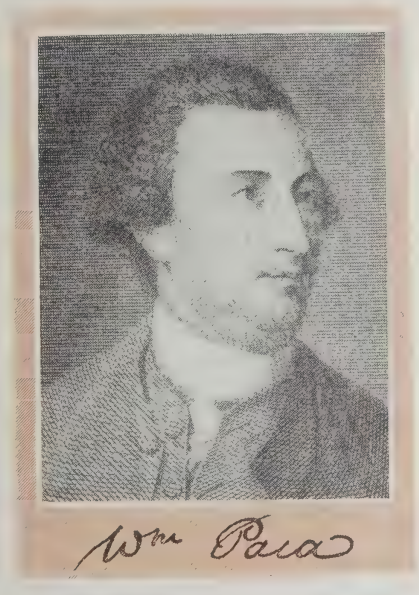
## in the Cause of This Nation's Freedom

SCHURZ LOWDEN
Carl Schurz Lowden)

at his heels." He was never lukewarm in his life. His outspokenness was forever getting him into trouble. He could not separate his feelings from his judgment. No one, however, questioned his sincerity and firm patriotism.



The Stamp Act, or tax, aroused Chase to physical action. He joined with others in forcing open the public offices at night, tearing up the hated stamps and burning the stamp distributor in effigy. The mayor and aldermen of Annapolis then denounced him as "a busy, restless incendiary, a ringleader of mobs, an inflaming son of discord, a common disturber of public tranquillity and a promoter of the lawless excesses of the multitude."

These words, though severe and relentless, were no cause of shame to the budding patriot. He had used his arms successfully; he would try his tongue.

"I admit, gentlemen," he answered, "that I was one of those who committed to flames, in effigy, the stamp distributor of the province and who openly disputed the parliamentary right to tax the Colonies, while you sulked in your homes, some of you asserting the parliamentary right to tax and esteeming the stamp act a benefic law. Others of you meanly grumbled in your corners not daring to speak out your sentiments."

It was bold and saucy language for a young men of twenty-five to apply to the constituted authorities of the city in which he resided. However, this uncompromising temper was thoroughly characteristic of Chase all of his life.

He found the attitude of Maryland very irksome when the assembly instructed its delegates not to vote in favor of independence. Chase ardently wanted freedom. He left his seat in Congress, and declared his convictions at numerous meetings. Though Maryland was the last of the original thirteen states to fall into line, it did so on the twenty-eighth day of June. The

zealous delegate wrote impulsively to John Adams.

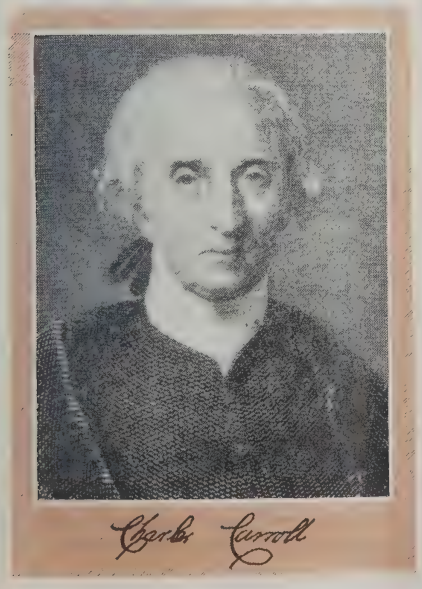
"I am just this moment," he declared, "from the House with an unanimous vote for independence. The people have fire, if it is not smothered."

With the painful restrictions overthrown, Chase demonstrated his unquenchable enthusiasm by following closely after the express that carried his letter. The distance from Annapolis to Philadelphia is approximately 150 miles. He traveled two days, Saturday and Sunday; on Monday morning he occupied a seat in the Continental Congress, and proceeded to vote as he had wished to vote from the time he was first sent there.

Chase certainly ranked among the most ardently active patriots meeting in Philadelphia. The number and variety of duties imposed upon him were really more than should have been assigned to any one individual. He was so industrious and efficient that highly discordant matters, whether military, financial, judicial, marine or political, were placed upon his shoulders. Richard Henry Lee, Gouveneur Morris and Chase were selected to prepare propaganda against conciliation with Great Britain and urging the advisability of independence; it seems that Chase really did the writing while Lee and Morris approved his sentiments.

"If," he promised the people, "you will not listen to these false words of conciliation but exert the means of defense which God and nature have given you, the time will soon arrive when every man shall sit under his own fig tree and there shall be none to make him afraid."

The paper was long and forceful. Ministers were recommended to read it from the pulpit immediately after their divine services. I consider it picturesque, bludgeoning language. I like it; and yet I feel that this Roosevelt of his time might have accomplished even more than he did for the cause if he had not lacked tact, diplomacy and the sweet reasonableness of suave leaders.



"The Demosthenes of Maryland," his associates named him. It is said of him that he was markedly vehement in his efforts for the passage of the independence resolution, and that at one time he violently exclaimed:

"By the God of Heaven, I owe no allegiance to the King of Great Britain!"

But he was not always rude. Chase had a kind heart. At Baltimore in 1783 he heard a young man debating in a club organized for that purpose. He liked his style of speech, discovered that he lived in Annapolis and was a pharmacal apprentice. The older man advised the younger to study law; on ascertaining that the youth had no means, Chase invited him to his own home and became his preceptor. Editors and publishers lay claim to locating and developing authors; Chase could have claimed credit for what he did as his plain duty. The eloquent young man of the debating club was William Pinckney, afterward Attorney-General of the United States, widely regarded as the most distinguished lawyer in America; he also served his country as minister to London, Naples, and St. Petersburg.

Chase himself passed much of his time abroad, particularly in London where he mingled with eminent lawyers. He liked William Pitt and Charles James Fox who had condemned the British policy toward the Colonies. On one occasion he stayed an entire week with Edmund Burke, who had delivered his famous "Speech on Conciliation," before the Parliament.

During the period that Samuel

Chase sat as a judge in Baltimore, a riot over party affairs culminated in the tarring and feathering of two men. Two citizens were arrested by the sheriff who deemed them so prominent that they would not need to give a bond to make certain they would come to the court session.

"Then," the judge answered, "you must go to jail."

He ordered the sheriff to take the accused men to jail, but the officer demurred. Chase then asked him to summon the posse comitatus to his assistance, but the sheriff explained that he could get no one to serve.

"Summon me, sir!" Judge Chase exclaimed. "I will be the posse comitatus. I will take them to jail."

A member of the bar interposed. He advised the judge to let the affair blow over, as the latter's life might be endangered. This suggested pussy-footing did not please the man on the bench.

*"The Life of One Man Is of Little Consequence"*

"God forbid," he emphatically replied, "that my countrymen should be guilty of so daring an outrage. Sir, with the blessing of God, I will do my duty. They may destroy my property, they may pull my house down over my head, yea, they may make a widow of my wife and my children fatherless; but, with the blessing of God, I will do my duty be the consequences what they may. The life of one man is of little consequence compared to the prostration of the laws of the land."

This short speech seems oratorical and vainglorious. However, in those old days the men were more heroic in their attitudes and habitually used a much more rhetorical, fulsome style than that employed by present-day statesmen.

Washington appointed Chase to the United States Supreme Court in 1796. He served in this capacity fifteen years, being frequently designated as "the most prompt, sagacious and learned judge of his time." With all this well-deserved reputation and despite the gratitude due him from the nation, he was impeached by the House, then tried before the Senate on charges of high misdemeanor and narrowly escaped conviction.

*Chase Faced Death Characteristically*

Why? Well, the cause may be found in his openness, in his custom of unreservedly expressing his opinions on national politics and censuring freely where he thought censure was deserved. It had been agreed to refer to him a case which he had already studied while it was threshed out before another judge. To save all the repeating of the evidence Judge Chase did publicly what other judges of the time did privately. He wrote out his judgment which he handed to the lawyers and jury before the case had been fully retried. His enemies accused him of prejudice; this term really means "prejudgment," and it was therefore truly accurate. Four years later the matter developed into a party issue with his conduct labeled "arbitrary, oppressive, unjust and having brought disgrace upon the character of the whole American bench." It is a miserable shame that this unquestionably sincere patriot and many others of the Revolution were mistreated or shabbily handled when they should have been revered for their deeds of the past and forgiven for their subsequent apparent shortcomings.

Chase faced death characteristically. When his physician ordered him to give up his favorite exercise, horseback riding, he knew that he could not live long. He put his affairs in order. He refused the last medicine tendered by saying, "God gives life," which, as it happened, were his last words.

The old judge was a strong Federalist; in fact, strong likes and dislikes were truly common in those days. He had a Democratic son-in-law. I suppose he would have preferred one of his own kind, but he made the best of the situation.

"Yes, sir," he whimsically told this son-in-law a few years before he had to give up horseback riding, "you are a Democrat. It is all right for you to be one, as you are a young man. An old man would be a fool to be a Democrat."

*When the Four Signers Met Together*

Chase made many enemies because he did not hold his tongue; for precisely the same reason, he kept many friends, and William Paca was one of these. Paca was a fellow signer, also an Annapolis resident. The two of them grew up together, as it were. Chase qualified in the mayor's court in 1761. Long afterward he reminisced:

"The bar then consisted of three practitioners, Messrs. William Paca, John Price, Jr., and myself. All of us had been students under Annapolis gentlemen who helped us for improvement without the remotest view of profit."

In 1771 an incident brought three of Maryland's four subsequent signers into contact with each other. Paca and a Mr. Hammond represented the citizens of Annapolis in a public letter of thanks to Charles Carroll for his activities "as an advocate of liberty." Carroll had carried on a paper war with the governor, and had questioned the latter's right to regulate the fees of civil officers by proclamation. Nevertheless the governor issued his proclamation which caused wide irritation. Paca and Samuel Chase then headed a group of citizens who took a copy of the proclamation to the gallows erected for the purpose just outside the city, hanged it there by a halter, left it the usual time for a criminal, cut it down, inclosed it in a coffin and buried it nearby while minute guns from an elegant armed schooner belonging to Mr. Paca were fired during the whole ceremony. The men then marched back inside the city limits and spent the remainder of the day in having a good time.

Now it may seem strange that there should have been an armed ship so long before the Revolution, also that it should be owned by Paca. It happened that the gentlemen whose estates were situated on the navigable waters of the Chesapeake contended with each other for the superiority of their bay boats. Paca had put small guns on his boat to put it ahead of those owned by others; so when he entered the city his arrival was often announced by the sound of the cannon.

Later this wealthy patriot opened his purse for the use of his public-spirited countrymen. On one occasion he and his fellow signer, Chase, supplied a volunteer corps with rifles at an expense that ranged around a thousand dollars.

*Paca's Policy of Gentle Persuasion*

Paca and his colleagues were for independence, but they had been specifically instructed not to consent to such a proposition. Though under this galling bondage from the colonial assembly, these delegates to the Philadelphia sessions did not resign because they hoped for a change in the instructions and they feared to step out lest their places might be filled with men who were opposed to independence.

In the meantime Paca employed a policy of gentle persuasion. Secretly he assisted in planning a naval armament, also aided in procuring saltpeter and other munitions for a war to be waged against a king that Maryland was publicly vowing to love forever. In the middle of May at the time when Congress declared that the royal authority had ceased and the separate colonies should form governments of their own, the Maryland convention reasserted its stand against independence. But this state of affairs could not last. The exertions of Paca, Chase, Carroll and other leaders induced the convention on the twenty-eighth of May to dispense with its opening prayer for the king and the royal family. After this initial step, the rest came easier; precisely one month later the original instructions were recalled and the delegates left free to vote as they thought best.

*Stone's Strength Lay in His Argument*

Throughout the trying period of the war Paca continued to be a member of Congress. He retired in 1778. Four years later he was chosen to be the governor of his native state. He was a man of remarkably graceful address, fine appearance and polished manners; therefore the courtesies of the governor's mansion were never more elegantly sustained than during his tenure of office.

Thomas Stone, the fourth Maryland signer, was a lawyer; he appeared in many important cases along with his friend, Samuel Chase. Though he had a weak voice and an unimpressive delivery, Stone's strength lay in his argument; his reasoning invariably cleared and became powerful when he warmed up to his subject.

What would you think of a boy so determined to obtain an education that he would ride ten miles each morning to school? Thomas Stone was that boy.

In 1775 Stone was a member of the Maryland assembly in Annapolis when the skirmishes of Lexington and Concord were fought. Greatly perturbed, he wrote at once to his wife.

"My heart," he told her, "is with you, and I wish I could see you, but many gentlemen insist that I should stay to deliberate on these important affairs. I wish to do my duty. I shall be obliged to stay here longer than I expected. We have accounts that numbers of people have been killed on both sides. I am truly apprehensive that this will preclude all hopes of any reconciliation between this and the mother country, a situation at which all thinking men must shudder. People here seem to feel very severely on the present occasion. I have determined to act according to the best of my judgment; but, in important and dangerous crises to which we are reduced, the best may err. Pray God preserve you and our little ones. We are apt to see times which will require all our fortitude to bear up against."

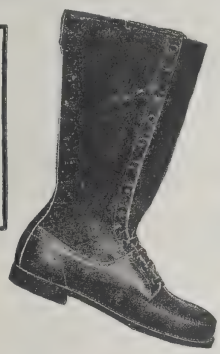
Although not a prominent man in Congress, Mr. Stone was placed on several important committees, perhaps the most difficult being the one assigned to prepare a plan for Confederation. Maryland was hostile toward the measure; as the only member from that colony on the committee, Stone felt hampered. Maryland refused her assent until 1781. From the twelfth of June, 1776, until the fifteenth of November, 1777, when the Confederation was adopted in Congress, Stone and the other members were constantly preparing, amending and improving the act; in fact, the act was the subject of debate thirty-nine times altogether.

When the Confederation had been adopted by Congress, Stone declined further reappointment and became a member of the Maryland legislature to fight for the acceptance of the plan there. His services were thus described by a gentleman who sat near him:

"He was most truly a perfect man of business. He would often take a pen and commit to paper all the necessary writings of the senate. Though appearing to have an irritable temper, he was mild and courteous in his general deportment, fond of society and conversation, and a universal favorite because of his great good humor and intelligence."

His wife died in 1787. With her passing he declined all business and sank into a deep melancholy. His physicians persuaded him to take a sea voyage. He went to Alexandria, Virginia, to embark for England; but his death occurred there before the start.

# Romantic Rascals



(*Concluded from page 17*)

*and Anne* never reached England, indeed never got out of sight of Iceland, and the gains of Mr. Phelps were swept away as swiftly as Jorgenson's ambitions. For Icelandic prisoners on board fired the ship, then made for the boats. At the first evidence of the disaster, Jorgenson was full of the splendor of courage. With others he rowed to the burning ship, leaped on board, and was like some strange spirit, running about the deck, beating cowardly and scared men into submission, helping to launch boats and batten down hatches, dragging senseless and half-choked prisoners from behind locked doors to safety. Nor was it any ordinary fire, for the cargo of oil and tallow soon caught and black poison smoke rolled over the water like a heavy cloud. Soon the vessel was like a blinding furnace.

But flouted, Law, like the gods, had to remember everlastingly and strike remorselessly, and, on landing in London, Jorgenson knew prison again, his only happiness being his memories. Being released at last, he was full of a fierce discontent, a discontent and restlessness that took him into strange company and unsavory adventures. His heedlessness and daring made him a tool for more nimble-minded rascals and at last there was an attempt at highway robbery on a Sussex road near Brighton. Because of that he was sent to Tasmania. There, an easier and kinder place than England for him, he recovered his old elasticity. He came again into glowing contact with earth and sky, and sun and clouds, and climbed out of the murky world of narrow-minded men and mean, with their plottings and intrigues. Instead of falling into the gulf with bushrangers and desperadoes, he followed a livelier inspiration. There was an exploring expedition fitting out to penetrate the wilder part of the interior, and Jorgen Jorgenson became a member of it. In that kind of thing was the delight of triumph and success, the following of things well worth the winning. It was the life vigorous and wholesome such as he loved.

At last, exploring being done, and a life of leisure being distasteful to him, he joined the Hobart mounted police, and was active to the day of his death, at the age of sixty-four, in the year 1844.

# Anyone Can Make a Speech

## Yes, But It All Depends Upon How a Person Sets About It

By H. S. M'CAULEY

THERE is no reason on earth why anyone of average intelligence should experience heart failure when he is suddenly called on to make an extempore speech at a gathering of people, or to prepare in advance an address to be delivered at some future time.

Talking to an audience is no harder than talking to a friend on the street corner. Indeed, it is easier and far more pleasant, for as a usual thing your audience does not interrupt or argue with you. It customarily applauds you. And whoever heard of an acquaintance doing that?

The average man is firmly persuaded that he can't make even a short talk. And the spectacle he presents when some overwhelming force finally induces him to "say a few words" at his lodge convention or before the city council when it is necessary to defeat the alley paving program that threatens to cost him and his neighbors $300 apiece is usually enough to justify such a conclusion.

But the average man *can* make a short talk or a long one, if he will go about it the right way. And furthermore the average man *must* make a talk of some kind in this day if he wants to get anywhere. If there ever existed a time when the world would beat a path to the backwoods mousetrap expert, that age has died. The man who gets ahead now must not only have the ability, but must be able to present it forcefully. He must be a verbalist as well as an analyst.

The most necessary requisite for the person who wants to make a talk is that he have an idea. This may seem ridiculous, but it is a fact that most people who appear foolish when they arise to speak do so because they did not know when they arose just what they wanted to talk about. They may have felt a vague urge within them, but it was not clear enough to supply their tongues with material for more than a few seconds.

I have trained several thousand men in the science and art of public speaking, and I have coached some of the biggest men in the Middle West for their appearance at directors' meetings, banquets, and conventions. Persuading my conferees, whether wealthy or obscure, to stick close to their subject and throw out extraneous matter has been one of my chief difficulties.

So if you are preparing a two-hour or a four-minute talk, start out by determining just what you are going to discuss and what you are going to say about it. Settle the nature of it before you start, and also clarify in your mind just what angles of the subject you are going to touch upon. Then stick to what you have laid down. Shoot with a rifle ball instead of a shotgun splatter.

Include nothing in your list of facts that does not bear in some way upon the topic with which you deal. This rule is important. Follow it, and you will have a clear-cut and coherent speech. Disregard it, and your talk will be rambling, hazy and weak.

For some reason that I have never been able to fathom, the inexperienced speaker wants to write out his speech fully in advance and commit it to memory word by word and period by period. Possibly he thinks he can't remember it unless it is learned after the fashion of the pieces he used to speak on Friday afternoon in school. This is a fallacy. Learning a talk word by word is next to impossible for a beginner, and if he accomplishes it his delivery is apt to be parrot-like. Usually the tyro ends by reading his address, an offense which I believe should be punished by hanging. Anyhow, I want some revenge for the thousand deaths I have died listening to mumbling amateurs groping their way through fifteen and twenty pages of single-spaced manuscript.

If you have followed my suggestion to pick out a central idea and muster your thoughts around it, you will have no trouble in following my next advice to arrange these thoughts in their logical order. I can't tell you just how to do this. If you know anything about your subject you will have slight trouble. Set down the main ideas as I, II, III, IV, et cetera, with the subordinate or amplifying ideas grouped after each, a, b, c, d, et cetera. Don't try to write out the talk, but put down merely the subject matter of the idea. Now go over this outline again and again until you can repeat it backward and forward. Get a mental picture of it. You will find this vastly easier than trying to learn several pages of manuscript by rote, and when this method is used the danger of your forgetting the speech is practically nil.

When you begin to speak you will have only to say what you want to about each of the ideas you have put into the list, and pass on to the next. While the outline itself may look pretty bald on paper, you will be astonished how fluently the words will come when you take up the ideas one at a time.

If your talk is to be a long one, there may be room for the introduction of several main ideas. But a very brief address should never be devoted to more

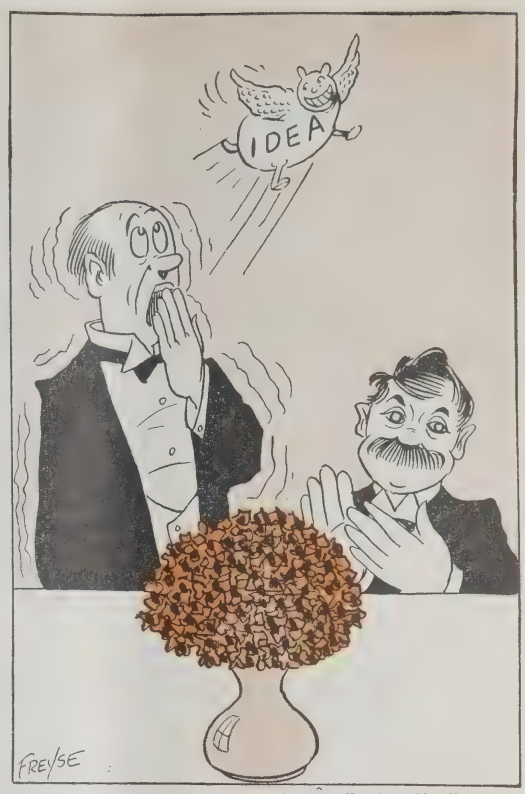
than one central topic. The Four-Minute Men of war days exemplified the wisdom of this principle very well.

Suppose you have been allotted from five to ten minutes to tell the club members (or a board of directors) that the proposed new roof on the boathouse (or the warehouse) should be of composition, rather than shingles. Your main idea then is, "composition roofing is superior to shingles for our purpose." An excellent and convincing method of presentation, which will do for this subject or any other in a brief talk, is as follows:

1. (a) Comparison of an incident showing the durable qualities of composition roofing with (b) an incident showing the less durable qualities of shingles.

2. Suggestion of the main theme of the talk: "Therefore, gentlemen, you can see that because of its durability the composition roofing appears better than shingles."

3. Explanation of four or five reasons for the difference in the incidents set forth in No. 1, such as methods of manufacture, materials contained, price, et cetera.



4. Confirmation with further incidents that show just where the reasons in No. 3 have been proved in practice, and when this occurred. Cite authorities, also, in support of your statement.

5. Conclude by summarizing very briefly your chief points: "So, then, gentlemen, because (1)....., because (2)....., because (3)....., and so on, I am sure you will want the extra durability in the composition roofing, rather than the shingles."

The actual delivery is the feature that frightens the timid into refusing to talk at all. But I want you to let this thought sink deep into your mind: If you could bring yourself to arise and express the ideas in your outline in the same manner, and using the same words you would employ in discussing them with a friend, you would probably be the hit of the evening.

The hardest thing which the beginner in speaking has to acquire is ease and nonchalance on the floor. Men who would abuse a traffic policeman with grace and distinction get tongue-tied when they face fifteen or fifty persons for whom they would entertain no more than average respect individually. They stutter, they stammer, they get red in the face, and do all sorts of ridiculous things. And yet never has such a speaker been able to discover a lemon or a brickbat in his audience.

The way to overcome this embarrassment, or, indeed, to avoid it altogether, is to go over and over your outline of ideas before an imaginary audience in an empty room, use any words that come to your tongue. If you work in front of a mirror, get quite a distance from it so you won't be grinning at yourself. This prevents your getting self-conscious. Do this, say, ten times, and you will be astonished how smoothly your words flow, and especially how readily your ideas present themselves when you call on them. Your fears of forgetting the talk will evaporate. Furthermore, you will be able to time yourself and avoid turning out as the pest who exceeds his speaking period and upsets the toastmaster, the other speakers and the audience. You can shorten the length of your talk either by leaving out some of the ideas you had included in it, or by speeding up your rate of delivery. You will find this latter very easy, after you have been over your talk plan three or four times.

"The most necessary requisite for the talker is an idea."

What to do with the hands is a problem that confronts every inexperienced speaker, and, indeed, proper gesture often puzzles those who have addressed gatherings for some time. A gesture is really a punctuation mark, or, say, an italic, designed to emphasize a statement. The trouble with the awkward motions made by many beginners in public speaking is that they are ill-timed. The punctuation, or the italics, have been put in the wrong place.

While the man who intends to make a forceful speaker of himself must expect to devote much practice to perfecting his gestures, it is true that a passable talk can be delivered without them. The speaker can "get by" fairly well if he allows his hands to hang easily at his sides, rests them from time to time on the table or stand before him, grasps the lapels of his coat, folds his arms, or even puts one hand in his trousers pocket. Mind you, I do not say that he must do these things. All of them are weak and inadequate compared to well-timed and graceful gestures. But for the man who is making his first address to a group they will do. Some mighty good speakers have these habits, and they somehow succeed.

Whatever you do with your hands, don't "fiddle" them nervously about, first here, then there, then some other place. So long as you can't gesticulate with skill, strive for ease in the disposition of your upper appendages.

While you are talking the greater weight of the body should rest upon your left foot, which is thrown twelve or fourteen inches in advance of the right. This will cause you to lean forward slightly, and will likewise cause you unconsciously to emphasize your remarks with swayings of the head and trunk,

"To be an orator, one must devote real study to the art."

which in turn will lend to your talk a force and conviction which it could never have otherwise. You will find yourself beginning to gesture slightly without thinking about it, which will be a further advantage.

One of the worst things a speaker can do is to throw his shoulders far back, fix his gaze on some point in the rear of the hall and maintain that position to the end. With your weight on one foot as I have indicated you will not be in much danger of doing that. But you must add further emphasis by addressing your statements directly to persons you can see before you in the audience. However, do not pick out any one person for your remarks. He may be grinning or sneering, and if you center too closely on him his individual action will have its effect on you. Select rather a little group in one part of the room. Then pass on to another. Each of your auditors in the vicinity of these people will think you have been talking directly to him, and your statements will sink home with double force. Experienced speakers make it a point to address all parts of the audience in this way at least once during the course of their talks.

If your first talk lasts longer than four or five minutes you may have some trouble with your voice. This can be avoided, however, if you are careful to rehearse your speech ten or fifteen times before delivery. You will thereby exercise your vocal chords and likewise learn if your throat needs care.

Unless you are different from most beginners the sound of your own words will frighten you when you first arise. The room will be deathly still, and your tones lifting and falling in the silence will seem altogether too vociferous. You may feel like lowering them, but it will be odd if someone at the back of the audience doesn't cry "Louder!" before you can do it. Not being accustomed to putting their lung power into their tones, most beginners habitually pitch their voices too low. They think they are talking loudly, but need to raise their pitch considerably before everyone can hear. So never hesitate to "yell right out." The best speakers use tones that would be called shouts in ordinary conversation. Your audience will criticize you for low pitch a long while before it objects to anything you may do in the way of noise-making. Don't be afraid on that score.

I am well aware that many persons will read these few directions and then say, "Well that may sound all right in theory, but you surely can't get made into an orator just by doing those few things." Very true. To become an orator you must practice for years, and devote real study to the art. This short article is not a textbook on oratory. It is merely a summary of the principles which I have found vital in my own work as a business speaker, and in training some pretty big business men, as well as innumerable students, to address audiences with ease and fluency.

If you will do what I have indicated herein, I'll guarantee that you will be able to arise in any gathering and make at least a five-minute talk which will not draw pity, or contempt, or ridicule. You may be considerably surprised, too, at the ripple of applause that follows your remarks.

## How Smoking Affects College Men

(*Concluded from page 8*)

associated both with smoking and with low scholarship. So we investigated further.

We found that heavy smokers have lower grades than light smokers. Heavy smokers average 3.00; light smokers, 3.23. More heavy than light smokers fall below diploma grade. (Students falling below diploma grade, 3.2, must improve scholarship or leave college.) Of nonsmokers, 31.8 per cent fall below diploma grade; of light smokers, 43.0 per cent; and of heavy smokers, 62.3 fall below.

Smokers who "inhale" have lower scholarship than those who do not. Of all smokers who do not inhale, 42.4 per cent fall below diploma grade; but of those who do inhale, 43.8 per cent of light smokers, and 65.1 per cent of heavy smokers fall below.

Smokers remaining in college fall steadily in scholarship (from 3.56 to 3.31 in three years). Nonsmokers maintain a nearly uniform average.

With these figures before us, it is hard to avoid the conclusion that smoking is actually a cause of mental inefficiency.

## "The Flower Pot"

OFF THE coast of Tutuila, less than a mile away from the entrance to the outer harbor of Pago Pago, American Samoa, there rises from the ocean a tiny islet of solid rock that reaches a height of about 60 feet above high tide level. The water is deep around its base, though it is only 50 feet or so offshore. It is circular in shape and on top is flat, and about 50 feet in diameter. A foot or so of earth covers the table-like top.

Years ago some one succeeded in planting a coconut tree on the top and now there are about a dozen coconut trees growing there. Some go straight up in the air; some incline over the precipitous sides. Bushes grow there that bear bright flowers. Vines send their tendrils far down the sides of the rock. It is a bright, exotic bit of tropical beauty that always brings a gasp of admiration from steamer passengers on the Pacific liners that enter the port.

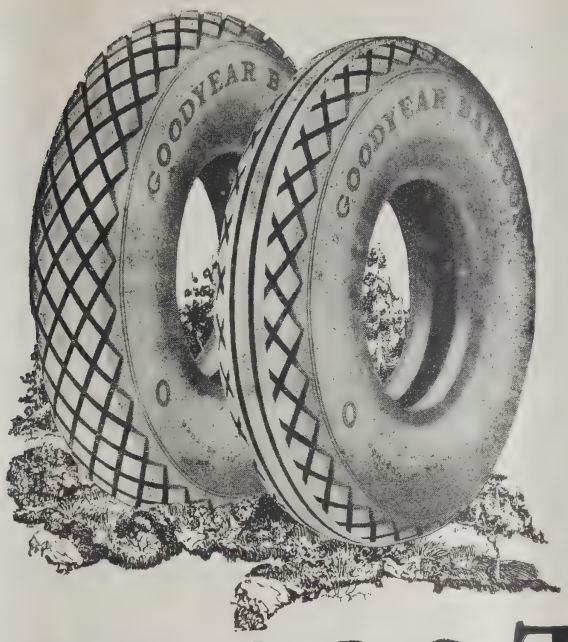
"Why, it looks just like a beautiful flower pot rising from the sea," women passengers exclaim. And that is its name, "The Flower Pot."

## Does the Office Belong to the Widow?

(*Concluded from page 5*)

of Lowell, Massachusetts, representing the Fifth Massachusetts District, died March 28 last, and on June 30, 1925, Mrs. Edith M. Rogers was elected to serve out the unexpired term, which, in this instance, means the entire term.

As a variation a third woman is to sit in the next House. She is Mrs. Mary T. Norton, of Jersey City, New Jersey. She is neither the daughter nor the widow of a Congressman.



In all, seven women have been elected to the national House of Representatives and so far none have been reëlected. One owed her election to the memory of her father and three succeeded their dead husbands.

Of the two woman governors of states Mrs. Miriam A. Ferguson's election in Texas was the result of a state fight, the details of which are too complicated for narration here as it is not a case in point, but Mrs. Nellie Taylor Ross was elected governor of Wyoming because her husband, W. B. Taylor, the popular governor of that state, nominated to succeed himself, died a month before the election last November. That she was unskilled in statecraft was admitted by her supporters, but for all that her election does not seem to have been a misfortune to the state.

When Senator Robert M. La Follette, of Wisconsin, died, some currency was give the report his widow might succeed him, but the rumor was soon discredited. A woman, however, has represented a sovereign state in that august body. Senator Thomas E. Watson, of Georgia, died suddenly in 1922 and Governor Harwick, of that state, appointed Mrs. Rebecca L. Felton to the vacant place. Congress was not then in session and a special election was called, so that the appointment was regarded merely as a compliment to the "grand old woman of Georgia," then 87 years of age, long prominent as a writer, lecturer and publicist. Judge Walter George was elected to the seat before Congress was called into extraordinary session, but the South is justly noted for chivalry. Senator-elect George graciously waited a day before presenting his credentials so that on November 21, 1922, Mrs. Felton was duly sworn in and made a creditable speech before a full house and a crowded gallery.

Senator George's courtesy to an admirable woman was beautiful. The sympathy and consideration of the electorate in giving the faithful public servant's office to his widow are commendably generous. The sentiment is thoroughly worthy.

But is the precedent to become the rule?

SUPERTWIST *was conceived, perfected and named by Goodyear, and is used only in Goodyear Tires*

# 75,000,000 Tires

## *The experience behind today's Goodyears*

Not long ago a thrill ran through the great Goodyear factories as word went down the line that the 75,000,000th Goodyear Tire was coming through.

The average mind must stand a little aghast at that figure; it represents the greatest total production yet attained by any tire manufacturer.

Some concept of the immensity of this production may be had from the realization that here are sufficient tires to equip all the automobiles built in this country in the past ten years.

Another way to picture it would be to say that if shipped in one incredible trainload, 41,644 freight cars would be required in a train 315 miles long.

Yes, assuredly "more people ride on Goodyear Tires than on any other kind," but it is less the hugeness of this total which is impressive than its meaning.

For the long procession of Goodyear Tires through the years has been quite as much an ascending march of progress as a parade of ever-increasing numbers.

Lighting the course of that progress have been important Goodyear contributions to the art of tire-building, such as the tire-making machine, oversize design, and the straight-side tire.

Again, from Goodyear sources came the development of the multiple-cord principle, the pneumatic truck tire, and only recently, the remarkable material SUPERTWIST.

What these fruits of Goodyear invention and application meant to tire improvement in earlier days, the new cord fabric SUPERTWIST means equally to the balloon tire now.

It brings to the flexible-sidewall balloon that extra elasticity and endurance which are needed to reinforce this modern tire's comfort with durability.

SUPERTWIST does this because it far outstretches the breaking point of standard cord fabric; under the impact of road shocks the SUPERTWIST cords in a Goodyear balloon yield and recover, like rubber bands.

This distributes the blow more widely over the tire, minimizes any chance of cord breakage, and safeguards against stone bruises and similar injuries.

Within the Goodyear Tires you buy today are not only the lessons learned in building 75,000,000 other Goodyears, but the special advantages of a new Goodyear material developed for modern needs.

Yet Goodyears cost you no more.

*Goodyear Means Good Wear*

# From Spain to Morocco

(*Continued from page 2*)

captain's bridge were nine canary cages all occupied. The crew was as like a horde of Barbary corsairs as one could imagine. Half a dozen of them had oily-black, ringleted hair. Their jaws opened into cavernous and sardonic smiles and their teeth were huge, yellow and devouring. They spoke a weird Algeciras gibberish. The passage was calm and brief and was enlivened by the antics of a touring company of Catalan players, shabby and down at the heel. They laughed frayed shop talk at one another, wrestled, teased their mascot—a yellow bilious-looking poodle—and played drafts on the deck. When the boat entered Ceuta harbor and the shaggy promontories of Africa leaned, as it were, through our rigging, and we breathed in advance the Moroccan air, four of the actors leaped to their feet and shouted, "Catalonia, Oh, my beloved country!" with tremendous, booming irony.

I fought my way through officials, Arabs, soldiers, hangers-on, and kicked my way to the waiting train—a springless, narrow-gauge affair, running as far as Tetuán, and the only railway in the Spanish western zone. In a confusion of humans, color, and strident sounds our train jerked into Ceuta town and there was boarded by all the jabbering color of Africa. The mazed eye was almost dulled by the rapid variety and unexpectedness of color. One saw everything at once: one saw nothing. The sight was like a constantly shaken kaleidoscope. Tall coffee-colored Arabs, as slender as bamboo poles, their faces fringed by strangely grown whiskers, like crisp dry lace, billowed across the rails and clambered into the train. These men talked in throaty, falsetto voices, like the notes of thinnest organ pipes. They smiled meagerly or merely glowered. One saw white turbans and brown turbans wound like bandages over their high, illusion-less foreheads, skulls which shone intellectually as though the learning of eons had dried up the blood and fiber within and had left only a tired and gleaming skull. The orange and green robes, the vermilion and madder, the silken intricacy of design humanized and gave passion and blood to those polished skulls. The white dust rose from the ground, cutting the eyes, scratching, as it were, the acute light of the sun as grit sears a mirror. The sun's heat was thick, animal heat, as though an enormous ox were hung in the sky and exuding heavy warmth. Half-naked Arab urchins came from window to window selling melted pastries studded with flies. Spanish officers met on the platform and thumped swinging greetings on to one another's shoulders, or chatted with their studied indifference to Arab notables.

These international gossipers were interesting to hear; the abundant, enthusiastic gestures of the Spaniard, the short falsetto crackle of the Moor; the Spaniard politely genial, ceremoniously indifferent, the Moor restrained, narrowly smiling and with lively eyes, with a reed-like, ironic quality to him. Both blasé, both skeptical, both superstitious, both loving death. For can one doubt the analogy between the Spanish, particularly the Castilian cult of death and blood as in All Souls' Day, Holy Week and the bullfight, and the excesses of Ramadan and the Arab desire to fall in battle and so obtain the sure reward of heaven? Once on the shores of Africa one cannot doubt the Berber origin of the Spanish.

"Arab women outside Mosque Tetuan."

"Africa begins at the Pyrenees," taunted Théophile Gautier. That is true. Africa and Spain, separated by a mere 14 miles of choppy water and by a mere 400 years of history, are inevitably thrown together. The Arabs despise the Spanish as they despise all Christians and Jews; but the Spanish admire the Arabs and I have known many a Spanish officer, official and civilian who feels drawn by an inexplicable influence to the Arabs, learns their language and studies their customs eagerly and has as much fervor for Morocco as for Spain. The Spanish respect the Arabs, leave them alone, let the Sultan's government look after them, and ask no more than any Spaniard ever asks—to be left in peace. They have not given civilization or roads or railways as the French have. The Arabs have had definitely less of white interference from the Spanish than from the French. And the Spaniard, like the Oriental, lacks any sense of time or duty. Yet East is East and West is West and there is apparently no common ground even on the halfway soil of Spain. That was the tragedy of the Spaniard chatting to an apparently friendly Arab on Ceuta station.

So a machine gun corps was attached to an armored car at the end of the train and we started at sundown for Tetuán, the Spanish headquarters. The country was a deserted wilderness rising into storm-blue mountains. So it extends throughout the western zone to the impenetrable Riff Mountains, watered by few rivers and covered with a crawling undergrowth, the roots of which have seized the earth like tentacles and defy all efforts of removal. Little cultivation is possible. A valueless wilderness. The railway was protected by patrols and blockhouses. After a jolting, two hours' journey we passed through scrappy almond orchards and eventually through rain-green pasturage and madder soil freshly plowed to Tetuán.

I pushed in a crowd of choking robes to the customs where a mathematically thin Arab was chalking baggage distantly with the fingers of a Euclid. Tetuán station is well outside the town which is terraced, white and gritty on a fertile hill. The town is like a tray of chipped crockery. Its white isn't a sun-strong glare; it has an ominous, hollow, bluish shade to it which is thrown by the storm-blue gloom of the Gorgues massif which banks up thousands of feet, two miles from the scrappy terraces of the town. As far as eye can see the smoke-blue mountains lie to all horizons endlessly, piled up, covered by that knotted serpentine undergrowth. There is something savage and animal about these mountains. They stand, pant and sweat and resounding insect life drums and twangs in and about their hides. Such a herd is uncontrollable.

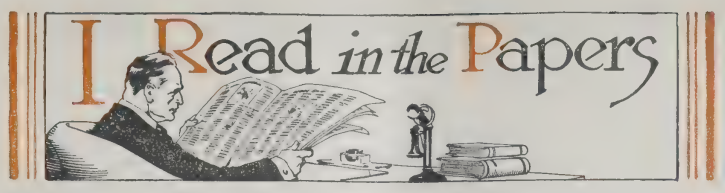
A hulking mongrel of a man was shouldering my luggage up the hill. We were following a retiring squadron of cavalry and limber. Suddenly there was an outburst of gun fire in the lower hills close to the town. The Arabs, I

gathered, were sniping the road. But the mongrel explained it with a dull, half-Spanish shrug. "It's one Moor. He's been at it for a fortnight. Every day at sunset he starts it when the posts retire and no one can find him—not even with airplanes." The desultory firing continued until midnight, at times bristling into a fusilade, the flashes and glint of fire visible on the mountain wall. In the morning the official dispatch read: "Without news in either zone." Laconic, splendid, stupid: a foolish, inevitable war.

The Spanish quarter of Tetuán is crude, ugly, dirty, inhabited by an odd mixture of criminals, half-castes, undesirable or merely restless Spanish exiles of low caste. The best hotel is occupied largely by officers, serves good food, but is dirty, smells, and is expensive. The Jewish quarter is filthy; lucre is literally filthy there. The Jews, fine, tall, hawk-like figures, capped and robed as in Bible times, sit and clink their money and exchange tidbits of news at filthy doorways. Their streets are straight and arranged at right angles, a relic of the almost recent days when the Arabs, jealous of the Jewish riches and hateful of their religion, would raid the quarter and massacre its inhabitants.

***Sickly Sweet With the Odors of Horrible Cooking***

The Arab quarter is a warren of alleys, tunnels, lanes, corners, clean and narrow. The air is sickly sweet with the odors of horrible cooking. In the booths are displayed the raw and fried entrails of birds and weird animals. There are strange limbs and tendons, a dreadful variety of flesh spiked on wood. The acrid smoke of frying stenches everywhere.



A group of Riffs passed in the market, hefty, dark-complexioned men with active muscles and warlike cheeks and jaws, querulous looking; a contrast to the almond-skinned, submissive Jebalas of Tetuán and all the country between it and the Riff Mountains.

"And Abd el Krin?" I asked.

"A man from the skies. A common man from under the skies. Any man could lead the Riffs," said my friend with superiority. "They live without laws."

I left my friend to his commerce. I shall remember his young smile, his fringe of wiry beard, the tilt of his fez, and the rich, almost lightless eyes. We had talked for many hours on everything, but how much nearer were we? I shrugged my shoulders; in the East one must put Fate among one's household gods.

This same fatalism and blindness and lack of contact or leadership characterized the Spanish headquarter authorities. The guerrilla warfare was wearing, sightless, a stupid day-to-day groping among the mountains, never affecting the enemy, and only demoralizing oneself. It is like that still.

***I read in the papers*** that 150 extremists in England are receiving salaries, bonuses, and other emoluments direct from Moscow. But many more than that are receiving their support direct from the British Government. It is one of the tenets of revolutionaries to "live off the enemy." Stanley Baldwin, the British Premier, is being taken to task by the newspapers, even those of his own party, for his attitude of easy-going cynicism toward the crowd that follows at the heels of the Soviet charge d'affaires. The pipe-smoking British Premier cannot puff away a menace of this kind. But he undoubtedly knows that. Neither can he alone destroy it. He is waiting for the English people to realize the situation.

***I read in the papers*** that the business men of almost every European country are hot under the collar at the operation of our tariff law which causes our government to send inspectors abroad to examine the books of concerns that export to America in order to determine costs and other data that will enable us to see if low valuations are being made on invoices to evade our high duties. To be perfectly candid about it, some of us who have encountered government agents, inspectors, enforcement officers and what not, who "check up" on the enforcement of domestic laws, have not been able to avoid meeting men who are unfit to represent the Federal Government. One cannot blame foreigners who are mad because they have been insulted and menaced by men who claim that they can blacklist firms that the inspectors do not approve. The opportunities for blackmailing, *abstraction of valuable trade information for the benefit of others*, and kindred abuses are as plain as a pikestaff. Our domestic experience with income tax, prohibition, narcotic, immigration and other agents indicates what other countries are objecting to.

*The International Jew* in 4 volumes: *The International Jew*, Vol. I, 235 pages; *Jewish Activities in the United States*, Vol. II, 256 pages; *Jewish Influence on American Life*, Vol. III, 256 pages; *Aspects of Jewish Power in the United States*, Vol. IV, 246 pages. Price: 25 cents each; set, $1. The Dearborn Publishing Company, Dearborn, Michigan.

***I read in the papers*** that a councilman in one of the largest cities in the country is righteously indignant because a vigilant civic association has denounced the coincidence of his being the chairman of the city building code committee and chairman of the board of building appeals and salesman for a brick company. He has admitted sales to contractors for ten structures upon which his councilmanic committee passed judgment. It would be a mistake, however, for the citizens of smaller communities to leap to the conclusion that such dubious conduct is confined to the "big cities." A scrutiny of the open and silent associations, business, professional and family, of the members of councils and school boards almost everywhere will disclose profitable opportunities that are more often developed than neglected. If every community had an intelligent, fearless civic association that would not hesitate clearly to inform the public about these personalities, a tremendous amount of the present public spending could be saved.

***I read in the papers*** that a Los Angeles judge has sentenced two fake stock salesmen to from 30 to 300 years in San Quentin prison—a prison, by the way, quite unnoted for luxuries or easy-going ways. The judge denied them freedom on bail pending appeal and likewise denied motion for a stay of execution of the sentence. The maximum sentence was made possible by a number of "counts" or separate transactions and will make it difficult to scale down the sentences sufficiently to permit quick pardon or parole. If every state were to furnish the high-pressure stock selling fraternity with a number of similar examples of summary justice in defense of the public, we might hear less of worthless stock promotions.

***I read in the papers*** that a Minnesota grand jury indicted a county roads' employe for using in his own car $1.25 worth of gasoline that was charged to the county. The trial lasted two days and cost the county $117 a day and also cost the defendant his lawyer's fee. It was shown that this employe gave the use of his car while on service for the county in return for gasoline necessary to run it on official trips, and of course the trial jury acquitted him. It was suggested by the defense that the indictment was returned purely for political purposes because the slightest investigation would have disclosed the facts. This incident goes to prove how easily prosecutions may be undertaken for the purpose of persecution. It is as vicious to use the legal machinery for such a purpose as it is to fail to punish positive crime.

# A Progressive Program

The fact that the latest Ford cars are offered without increase in price means more to the public than the mere saving in money—it gives even added confidence in the soundness of Ford methods and policy.

To build to an ever-advancing standard of beauty, comfort and convenience without increasing price—is possible only through Ford resources, facilities, production methods and volume of output.

Every Ford owner is assured more than a present saving—he can feel confident of the sustained quality, both in performance and service, which makes his car a sound and satisfying investment.

FORD MOTOR COMPANY, DETROIT, MICH.

# Among the Byways of Old Cornwall

## A "Land of Myth and Mystery," Where King Arthur and His Knights Flourished

By HEBERT TANGYE

ABOUT a generation ago the people of England awoke to the fact that in the county of Cornwall they possessed a land with a history dating back to the Pharaohs, and with relics of all ages from the Paleolithic down. It was trading with Mediterranean peoples a thousand years before the rest of the country was civilized, and was Christianized a hundred years before St. Augustine came over to convert the heathen in A.D. 597. The attraction of a romantic past accentuates the charms of the verdure-clad hills and dales, the wild and rugged cliffs that have borne the assaults of the stormy Atlantic through uncounted ages, and the wood-bordered rivers like the incomparable Fal; while the ancient language, myths, legends, and a folklore old when the Scandinavian was still unborn add an interest even for the scholar. There are buildings that existed before the Conquest in 1097 and some from the time when Julius Caesar landed 55 B. C.; while there are others, such as the "Giants' Hedge," or wall near Love, whose age and object are lost in the mists of time.

The Sacrificial Rock. This curiously cut work at Carn Brea, Cornwall, is of unfathomable age, and has chambers shaped apparently for the sacrifice of large and small animals, and even suited to human beings, with an outlet for blood.

"One day the devil having nothing to do
Built a great hedge from Lerrin to
Love,"

runs the old couplet. This mysterious work is seven miles long, seven feet high and in some places twenty feet wide. It may be as prehistoric as the Sphinx, or as ancient as the great wall of China, for all that is known about it.

Scattered through the country are ruins of castles so old that their origin is lost in myth and legend. On the far north coast is Tintagel, otherwise Dundagel, birthplace of King Arthur, around whose heroic name cluster legends innumerable. Here he reigned after the death of his father, King Uther, and here the famous Knights of the Round Table became the first Order of that famous chivalry which in later ages so influenced the history of Europe for good and evil. Tennyson loved the spot, and it is the central scene of his greatest poem. In 1245 the ruins were restored, but most of the walls have long since decayed and fallen. Part of the castle is on a small island, which was once connected to the mainland by a drawbridge. In 1583, Sir Richard Grenville wrote that this bridge had been washed away within living memory.

This Grenville was the famous Cornishman who, in 1591, with his little ship, the *Revenge*, fought a Spanish fleet of fifty-three men-of-war, refusing to retreat or yield, and—

. . . After fifteen hours of fight
The unconquered sea-king stood,
Defying all the power of Spain;
Fifteen armadas hurled in vain
And fifteen hundred foemen slain.

* * *

Sir Richard's wounds were hot and deep:
Then cried he with proud, pale lip,
"Ho, Master-Gunner sink the ship."

A ruin around which myth and legend have thickly formed is Dunheved, now known as Launceston Castle. It was old and in disrepair when Edward the Black Prince, first Duke of Cornwall (the previous holders had been earls) visited his new duchy in 1353. The thinnest walls are three feet thick. The castle is just within the Cornish border, and for hundreds of years the judges of Assize ventured no farther into the turbulent West-country. Indeed, several revolutions of the Middle Ages originated in Cornwall and attained national dimensions. It was a land of smugglers and wreckers, and the privileges granted to men of position directly led to crime. Queen Elizabeth, for example, gave all wrecks at Scilly to the governor on condition that he shared them with the Lord High Admiral. In 1699 the law made wrecks the property of the governor *if none of the crew remained alive.* The law had no certain hold in the extreme West until the eighteenth century, and the tower of the old Pengersick castle still exists in a fair state of repair, in which a wealthy criminal found refuge in the time of Henry VIII, that king's officers not daring to venture into the county to arrest him.

Trematon Castle, another picturesque ruin, was granted by the conqueror in the eleventh century to his brother. About 160 years ago, when the sketch was made, the castle was in fair repair. Edward III gave it, about 1350 to his son the Black Prince when he created him Duke of Cornwall, so settling the title that it devolved, not by primogeniture as under the feudal law, but to the eldest son of the reigning sovereign. Thus a Prince of Wales is Duke of Cornwall even before he is specially created to the former title, and as Duke he becomes of age when he is born and does not have to wait until he is 21. This manor was held by the Cornish kings prior to the Conquest, and in 980 King Athelmaul reigned there. The name Trematon, or Trematern, signified *King's* Town in the Cornish language, which began to disappear in the seventeenth century, but was still spoken by some at the end of the eighteenth.

Of all the old buildings in Cornwall the most remarkable is the strange castle on Carn Brea hill. This hill rises sharply, almost precipitously, to a height of 740 feet and is in places covered with huge granite boulders, some weighing hundreds of tons. Perched right on top of two contiguous heaps of rocks at the highest point of the eastern extremity is a curious building, apparently on a foundation liable to shift at any instant. Yet, except the solid granite strata below, one might search the world through for a safer base, or one better calculated to defy the stress of the ages. Doubtless it is the oldest still inhabited building in the world, for notwithstanding its exposed position, open to every gale that blows, it has survived the storms of 2,000 years and is likely to continue for ages longer. Unlike the Norman and Saxon castles, it has no moat or outer walls, nor has it doors to be protected from assault by loopholes for archers and channels above through which melted lead could be poured on besiegers. Its one simple entrance in olden days was through a trap or flagstone in the flow of the bottom story, and this could only be reached from outside by one man at a time through a narrow space between two of the great granite boulders which form the foundation. This entrance was built up when a flight of granite steps was erected about a hundred years ago, but in the ages before powder was invented nothing could have been more secure, and it is the most ancient

method of defensive architecture known.

The walls are by no means as thick as those of Norman castles, but they must have been built with a much superior joining material, probably similar to that Roman cement the secret of which has been lost. Florence of Worcester mentioned this castle 500 years ago, and references by both Orosius and Julius Caesar, the latter in his Commentaries, have been identified with it.

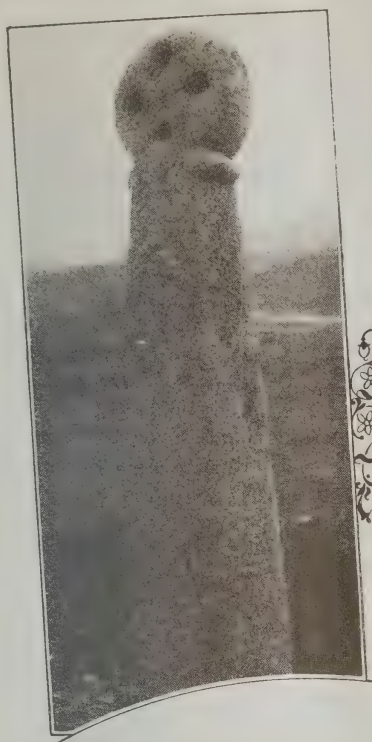
From the flat summit of this hill many remains of Paleolithic and Neolithic races have been recovered. One unique cave between the rocks was found to have been an actual manufactory for flint implements, the floor being littered with chips. This flint stone is not found in Cornwall, and must have been brought at least a hundred miles. In later, but still prehistoric times, hut dwellers occupied the top of the hill, and the stone circles on which their huts were erected, on being excavated, were found rich in flint implements, while rock fire-pits for cooking were found in nearly every case. These hut circles cover the top of the hill.

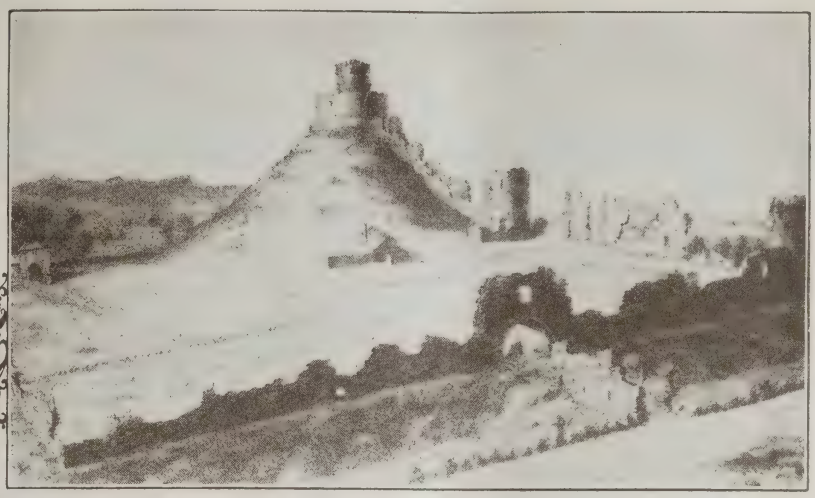
In a comparatively modern period, somewhere between 2,000 and 3,000 years ago, a fortress was built on the top of the carn, and it would appear to have been occupied by the Phoenicians or other Semitic traders of that day. The plan of the fortress is almost identical with that of the Zimbabwe ruins in Mashonaland, South Africa. In both cases the granite blocks are used in such a way as to suggest that the builders had only been accustomed to build in brick, and they are set one upon the other without any cementing material. Sir Norman Lockyer has stated that at both Zimbabwe and Carn Brea the gateways are fixed on astronomical principles. The position of the altar is in each case the same.

King Solomon is believed to have obtained the gold for his temple from Zimbabwe, and it is a local legend that he obtained his tin from Cornwall. But it is, at any rate, clear that the same race traded with both these far-distant places, for, in addition to many references in ancient writings, corroboration is found in the fact that an ancient ingot of tin was dredged up some years ago in Falmouth Harbor (ten miles from Carn Brea hill), and an ingot mold of precisely the same curious shape was discovered at Zimbabwe.

On the eastern declivity of Carn Brea hill, not far below the Castle, is a tiny ruin which is on precisely the spot that measurements would give as the site of the cell of St. Ewinus or Uny, the founder of the church and estate contiguous. He landed in Cornwall sometime in the sixth century, and was granted the land by King Tewdar, a tyrant of that time. The cell is not large enough for any creature bigger than a large dog to lie down in, and as the locality has never been disturbed it is, more than likely, the actual original cell of such a strict anchorite as St. Uny. The cross in the photograph indicates the entrance.

Another famous saint, Piran, friend of St. Patrick, crossed over from Ireland to Cornwall some time between A.D. 400 and 500, and settled near the sea at a place named after him, Perranporth. (The whole of Cornwall so teems with villages named after the saints who ministered on the spot that it has been called "The Land of Saints.") St. Piran built a tiny church 25 feet long, 13 feet broad and 19 feet to the top of the gables, which in the ninth century was buried in the encroaching sands and so lost for a thousand years. In 1835 it was found again and uncovered. The sketch, from a rare old print, shows it as it then was, but much of it was carried away before protection was organized in recent years. Ultimately it was surrounded by iron rails, and later was completely housed in a substantial stone building, where it can be seen today. It is undoubtedly one of the oldest Christian buildings in the world. Beneath the altar a headless skeleton, without doubt that of St. Piran himself, was found, and was replaced. Above, there is a place for a sort of canopy in which the head was once lodged. It is historical that as late as 1281 the church possessed what was said to be St. Piran's head, which was kept in a box as a relic, and its absence from under the altar confirms this.



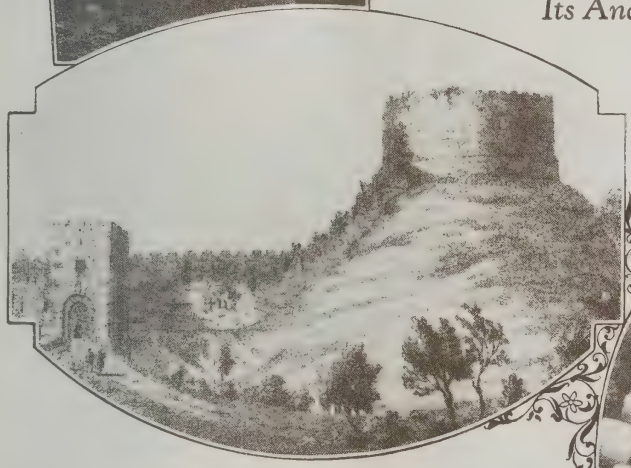


Tintagel (otherwise Dundagel) Castle, where King Arthur sat at the traditional Round Table with his Knights. (From a 160-year-old print.)

The county is noted for the number of its church towers set up in the Middle Ages, and which have in most cases outlasted several churches. In fact, it is not uncommon to see the old tower in one part of the churchyard and the modern church in another. These towers and churches sometimes possess gargoyles, the handicraft of the old monks, which are set at the bottom of water chutes well above the ground. Absurd faces, vomiting streams of water from their mouths on a rainy day, are an amusing sight. The monks of those days must have been a jolly lot, especially as there is a suspicion that the grimacing features perpetuate once living originals in caricature. The group shown is in the grounds of Trerice Manor House, built in 1570, from which they were removed during renovation, and are probably spoils from some earlier building.

Between Cornwall and the Scilly Isles is a raised bottom in the sea, declared to be the lost land once known as Lyonesse, which disappeared in the eleventh century with eleven towns and one hundred and forty churches. In 1014, says the old Saxon Chronicle, the sea "ran up as far as never at no time before; it drowned many towns and mankind too innumerable to be computed." In 1099 there was another devastating flood which, wrote the old Monk, Florence of Worcester, "buries towns and men very many, oxen and sheep innumerable." Tree trunks, doors and window frames have been dredged up in modern times, and fishermen declare that in clear weather at low tides remains of buildings can be seen, as well as paved causeways. A similar inundation took place near St. Michael's Mount, and in Mount's Bay on a clear day fishermen have seen tree trunks at the bottom of the sea. The old Greek and Roman writers describe islands and mainland which are not now recognizable. That great tracts of land have been lost is historical, and the similarity between the old languages of the Bretons, Cornish, Welsh and Scotch on the extreme west coast of Europe together with their obvious age, yet unlikeness to other European tongues, including English, has led to the conjecture that these border tongues may be remnants of the now legendary lost continent of Atlantis.

In the eighteenth century the Bretons of France could understand Cornish perfectly; a great number of the words were also common to old Scottish, and along the border of Northwest Europe.



Left—Ancient cross at Perranporth, about 500 A.D. Above —Dunheved, otherwise Launceston Castle, famous in legend.

HOW many millions of people come into, and go out of the world, ignorant of themselves, and of the world they have lived in. . . . The world is certainly a great and stately volume of natural things; and may be not improperly styled the hieroglyphics of a better: But, alas! how very few leaves of it do we seriously turn over. This ought to be the subject of the education of our youth, who, at twenty, when they should be fit for business, know little or nothing about it.

# BRIEFLY TOLD

A half-million people live on the desert land of the Sahara.

Lady Astor was refused permission to broadcast a speech before the W.C.T.U. on the ground that prohibition was too controversial for broadcasting.

Cornstalks near Ames, Iowa, grew 25.8 inches in six consecutive July days.

On September 23, 1880, when Washington's Monument was under construction at 160 feet, a cat jumped from the top without being killed, and as a result is now stuffed and in the Smithsonian Institution museum.

Herbert Spencer said that "to save men from the consequences of their folly would fill the world with fools."

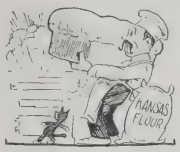
Dreaming he was enjoying a swim in a nearby bathing pool, a farmer near Gettysburg, South Dakota, dived out of his bed and was badly bruised.

Perpendicular road cuts that form excellent nesting places for thousands of bank swallows can be seen in the loessal regions outside of Sioux City, Iowa.

The camel is thought to be the first animal used by man.

A member of the Portland, Oregon, fire department recently confessed to kindling thirty-eight fires, and approximate loss of property was $100,000.

A new dewberry that is larger and more disease-resistant than the ordinary garden variety is the result of hybridizing by B. M. Young, an electrical engineer of Louisiana, who makes a hobby of plant breeding.



In many places in the Sahara Desert, it is burning hot at noon and freezing cold at night.

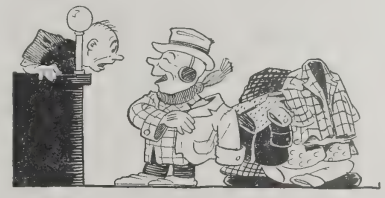
Charles Darwin once took from the foot of a wandering bird a small fragment of earth which, when moistened, and planted, produced no less than eighty plants.

South Carolinians pay a gasoline tax of five cents a gallon.

The boundary line between Poland and Germany is often crowded with men, women, and children bicycle riders.

The poppy again flourishes in China since the revolutionary generals have revoked the Imperial Edict of 1906 suppressing the cultivation of that crop.

The percentage of protein in Kansas wheat this year is so great that the bakers are afraid to bake with it unless diluted with a poorer grade of flour secured from other states. Loaves made from this "peppy" flour hit the top of the oven, they are so light, according to the State Board of Agriculture.



New York once received its water supply through a pine log water main, and a log 14 inches in diameter from its first water main of 1799 was dug up in a perfect state of preservation on July 27, 1923.

When bears climb up an aspen their scratches leave a permanent record on the tree.

The world's fur capital has ever moved westward, it having started at Vienna and moved to Leipzig, Amsterdam, Paris, and London, until now it is located at St. Louis, Missouri.

Prairie dogs and prairie owls are good neighbors, but both hate the rattlesnakes which infest their burrows.

Recent studies of soft pork by J. O. Halvorsen and Earl Hostetler indicate that to harden a peanut-fed hog the pig must eat two to three times as much starch as oil.

A Toronto man was arrested wearing twelve shirts, six towels, two suits of underwear and one scarf. When asked by the judge his reason for so much apparel he said cold weather was coming on, and he wished to be prepared. He was held on a charge of larceny.

Charles W. Law, of Davenport, Iowa, preached his own funeral sermon by having it prepared upon phonograph records a short time before his death.

Members of the Amana communistic communities in Iowa refuse to ride in automobiles and do not believe in painting their houses.

Dr. J. W. Turrentine, of the U. S. Department of Agriculture, says that half the girls living in a belt extending from New York to the Rocky Mountains have incipient goiter.

A map covering 2,750 feet of canvas, said to be the largest in the world, has been unveiled in Rome.

In the North Atlantic Ocean waves forty feet high are considered of extreme height, but a picture of a sixty-foot wave was taken from the *Leviathan* in November of last year.

Fresh hand-husked corn has at least four times as many bacteria on it as that which is machine husked.

In China there is one native Christian to every 200 inhabitants.

The beating of the tom-tom in Melanesia serves to warn the villagers of the approach of the tax collector who finds only cold hearthstones and deserted dwellings.

Though many hard-of-hearing persons think they hear better on a train than in a quiet place, recent experiments indicate that they do not, but the speakers talk louder.

A new sundial that tells time to within half a minute, on an ordinary clock face, has been perfected by W. E. Cooke, of Sydney, Australia.

An apartment house in Copenhagen built by the "Women's Home Building Society for unmarried, self-supporting women" has been named the "Clara Raphael's House" in honor of Denmark's first feminist.

The *N C 4*, first plane to cross the Atlantic, has been offered to the National Museum but was not accepted because of a lack of room.

Torrents of rain often fall during the sandstorms of the Sahara Desert.

DEARBORN, MICHIGAN
Henry Ford, President; E. G. Liebold, Vice-President and Treasurer;
C. B. Longley, Secretary; W. J. Cameron, Editor.

Vol. 26, No. 4

Change of Address

1. Notify us at least tw weeks in advance. 2. Give both old and new address. 3. Write clearly.

Entered as Second-Class Matter at the Post Office at Dearborn, Mich., under the Act of March 3, 1879. Additional entry at Chicago, Ill.

# Presented in This Issue:

Mr. Ford's Page this week discusses bigger competition.

---

One thing is certain: the flapper of fiction is not the flapper of real life. What about the flappers? A man who has widely observed them gives his impressions. He thinks the world has not degenerated into flapperism, but has risen to it. (p. 2)

---

O. Henry's own story was as good as anything he ever wrote. He was a character as well as an author. In this article one of O. Henry's editors tells the story of the man. It affords intimate glimpses of the author's life at that period when editors and publishers were beginning to form a queue to secure the things he wrote. (p. 4)

---

The following letter is from Wallace Smith Murray, who was Secretary of the American Legation in Persia during the period of the Imbrie incident:

October 6, 1925

"The Editor of
THE DEARBORN INDEPENDENT
Sir.

I have seen and read with interest an article entitled: Another Indemnity –This Time Persia, which appeared in the issue of THE DEARBORN INDEPENDENT of September 19.

I should be very appreciative if you would, by the publication of this letter, make it clear that, in the conversation which Mr. Wilkie reports having had with me, the only comment which I had to make on the killing of Vice-Consul Imbrie in Teheran in July, 1924, was to point out the wise spirit of moderation combined with firmness at the proper moment which the Department of State employed in effecting a satisfactory settlement of a most difficult situation.

Needless to say, Mr. Wilkie's recapitulation of the incident itself is his own and not mine.

Very sincerely yours,
Wallace Smith Murray."

---

Parasites are generally hunted that they may be destroyed, but here are parasites cherished that they may be used to destroy other parasites. Certain parasites are more useful to the farmer and fruit-grower than all the fertilizers and methods of cultivation that scientists have devised. Scouring the earth for just the right kind of crop-saver is as full of thrills as the hunting of lions and tigers. (p. 6)

The hold-up man is crude compared with the individual who uses the post office to rob the public. Old-time highwaymen used to rob the mail; the modern crook makes the mail his ally. How this is done may directly concern you. (p. 7)

---

"All the world's a stage," says Shakespeare, but the offices of certain business men are sometimes good places to hear what the actors are saying. (p. 12)

---

What is a bandbox and why is it a "band" box? Our grandmothers knew all about it. Bandboxes were to them as vanity bags and fancy purses are to the present generation. Bandboxes are now rare and desirable antiques. (p. 13)

---

The art of advertising is by no means new. Amerigo Vespucci was a better publicist than Christopher Columbus; that is why this continent is called America and not Columbia. Vespucci made the accounts of his voyages more interesting than those of his Genoese rival, and so they were more widely read. (p. 14)

---

Where do the cartoonists get their ideas? Cartoons have more than once played an important part in shaping public affairs. Pictures are often more powerful than print and documents. Thomas L. Masson knows all about cartoons, their making, and makers. (p. 16)

---

Why post up "Safety First" if no one can read it? Ignorance of English is the cause of much bodily injury and loss of life in industrial America every year. (p. 18)

---

The Secretary of the Baha'is in the United States and Canada writes with reference to a statement in our issue of September 19, which ascribes to the Baha'is of Teheran the belief that a certain fountain had been the scene of an authentic "miracle" and hence was to be regarded as a place of special sacredness:

"The Editor
THE DEARBORN INDEPENDENT
Dear Sir:

The exact opposite is the truth. It was the orthodox Mohammedans who held this belief, the reason being the story widely spread among the ignorant populace that a Baha'i had received divine punishment at this fountain for having cursed Mahomet and the Moslem religion.

The superstition about the "sacred well," as a matter of fact, was but part of a widespread anti-Baha'i uprising fomented by the Mohammedan clergy with the object of bringing about another massacre of Baha'is at the time of one of the annual Mohammedan holy days. It should be of direct interest to all of Major Imbrie's countrymen that the immediate cause of his death in Teheran was his insistence that the authorities afford adequate protection for the local Baha'is, among whom were two American women supervising the Tarbiat School for Girls. It was solely Major Imbrie's courage and energy which prevented this armed uprising, thereby incurring the rage of the disappointed fanatics.

Among the Persian Baha'is today, the name of Major Imbrie is held in the highest reverence and gratitude as a martyr by whose sacrifice they secured a new degree of protection from the government and a wider hearing among the enlightened who direct public opinion throughout the western world. During the past eighty years more than twenty thousand Baha'is have been tortured and slain in Persia on account of their universal religion. The murder of Vice-Consul Imbrie served to lift the veil at last from this unbelievable story of cruel oppression.

Yours faithfully,
Horace Holley,
Secretary."

# Why Flappers Flap

## Because the Clinging Vine No Longer Clings

By SAMUEL CROWTHER

ONCE upon a time we had the clinging vine. Now we have the flapper. The first made a profession of dependence. The second makes a profession of independence. Both are expressions of their times. In the days of the clinging vine, the ambition of the male of the species was to get enough money to do nothing. Now the ambition is to get enough money to do something.

The vine had rather a rotten time of it. She had to keep herself ready to faint gracefully whenever etiquette said she ought to faint—as, for instance, if a mouse happened to stroll in.

No matter how hungry she was, she just had to peck at food in public—a real lady was not supposed to have an appetite. And her clothes were skillfully arranged so that she could not do anything even if she had wanted to. She languished from hoop skirts to sweeping trains to balloon sleeves. Always she had a steel and whalebone armor underneath about which polite people never spoke.

A woman's clothes express her desire for freedom. The clinging vine did not want any freedom and her clothes told the world she didn't. The flapper has stopped thinking about freedom—she has it. And her clothes show it.

Mixing up clothes and morality is all nonsense—it is getting into the rank, hypocritical field of formal virtue—into the domain of the silly old fools who buzz around the bathing beaches measuring the length of skirts. Exactly the same sort of people go out into Mohammedan countries and think they have accomplished something of high moral importance when they have persuaded a woman to go about unveiled—although in Islam it is the veil and not the skirt that makes a good woman. Perhaps some day a new prophet, inspired by our veil makers, will stage a counter offensive.

But what is this flapper we are talking about? Is she a terrible thing bent on upsetting her elders and their conventions, or is she just the new generation blossoming rather nicely? I first met the word "flapper" some twenty years ago, strolling about Oxford University with an undergraduate acquaintance. Suddenly he exclaimed:

"There goes the maudlin flapper."

I looked quickly to see something extraordinary—like an intoxicated turtle, or a demented peacock—but I only saw a very pretty, trim little girl with her hair done down over her ears.

"Where is it?" I demanded.

"Right there. Don't you see her? She is the prettiest girl in Oxford. She is the daughter of the head of maudlin."

And then it reached me! Magdalen is at Oxford pronounced as though it were spelled "maudlin." My friend was conveying to me the fact that here was the daughter of the head of Magdalen College. This was in the days when women still had ears; "flapper" denoted a girl with her hair dressed in flaps over her ears. And that, philologically, is that.

The modern American flapper—as far as dress goes—is a uniform national product. Humans being what they are, flappers differ considerably in size, in both artificial and natural coloring, in manner of speech, and in finesse, but when it comes to general get-up they are all alike. They all have short hair—the degree of shortness and frizziness, however, is a highly technical matter, which can be studied only with the aid of the barber shop charts. Styles in flapper hair cutting do not, I believe, stay put. The flapper age limit is indefinite; some flappers have one foot in the cradle, while others have one foot in the grave.

But aside from such details and the quality of clothing, the flapper uniform varies less than that of the army. I have been in nearly every state in the Union this year and I have yet to find any variation in the dress of the flapper, nor have I seen any younger girl who is not a flapper. We thought the "flu" spread rapidly, but if it had ever come within hailing distance of the spread of flapperism this would now be a sparsely inhabited country. Nobody is too poor to be a flapper, nor is anybody too rich. The homesteaders' cabins of the West, the Negro shacks of the South, the big houses everywhere all have their flappers. The thing is universal.

What is it? First let us get rid of the fiction flapper. There are just as many of her as there are of movie heroes in real life. She just isn't, and a lot of good white paper has been completely spoiled lamenting the terrible state of the flapper and exhorting her to refrain from going to the devil. Common sense teaches us that people do not strive for perdition *en masse*. It is a purely personal perquisite. Hell as a destination is no more popular than ever it was. Since the beginning of time, we have had people who could see only evil, and until the end of time we shall have them—the world would not be normal without them.

Flapperism also has nothing to do with what is grandly known as the Youth Movement. This movement is a little difficult to define but it seems to have something to do with youth knowing more than age—although there is nothing new in that idea. Children have been telling their parents that for ages—and trying to get away with it. As far as I can discover, the Youth Movement is a determined effort by self-conscious, serious young men, unsaved by humor, to educate and properly bring up not only their parents but all parents. *E pluribus unum* against lickings—spoil the rod and save the child. The flapper is too busy to get in on all this. She cannot go around to uplifting all parental humanity, and also she has learned that parents have their uses and that a great deal may be done with them if handled gently.

***Flapperism Is Not a Movement***

Flappers do not go in for being suffragettes. They care nothing at all for women's rights—whatever they may be. The principal distinction of the suffragette was that she tried to dress like a man who had bad taste in clothing. When they came asking for the vote, they got it almost at once, principally because it seemed fine to have someone who really wanted to vote. Now there is practically nothing for a full-time suffragette or feminist to do. A few have become enchanted with the notion of keeping their maiden names after marriage—because it makes married life so ingeniously complex. The suggested solution that the bride and groom hyphenate their names has been rejected, for a mathematician calculated that in ten generations names would widen to around three yards and calling cards would have to be rolled like Chinese prayers.

Being a flapper is not being in any movement. Being a flapper is just being a flapper—which is the same thing as saying being wholesome and alert. We have not degenerated into flapperism. We have risen to it. A woman's crowning glory may be her hair, or again it may not be—we no longer measure a man by the length of his beard, although at one time we did. A flapper is a flapper as far as clothing goes simply because the present style of women's clothing is more sensible and comfortable than any previous style.

***Woman's Single Vocation Not Now Marriage***

Flapperism is not a cult. It is simply a general and really unconscious recognition by young women that they are persons—and that is why the flappers are making America.

They are changing the economic position of woman—changing it easily and surely without any hullabaloo of processions and badges. It used to be that the single vocation of woman was marriage, and those who worked considered their jobs only as disagreeable stopgaps until some man would agree to marry and support them. By common consent a woman earning a good salary by her own efforts was less happy than a woman drudging in her husband's kitchen. The greatest of all disgraces was to be an old maid. The next greatest disgrace was to work after marriage. Unnumbered thousands of girls whose stories will never be told have broken themselves in poverty because they married husbands who could not support them and rigid, merciless convention forbade them to support themselves.

That convention has been nearly broken—it holds no longer among the young, it holds only among those who were brought up in it and who are too stupid to change. And another convention has been broken—the notion of man as a superior animal. The Mormons are about the only people who have been able to keep up the bluff. It is a fundamental in the doctrine of the Latter Day Saints that a woman may attain heaven, so to speak, only in the wake of a man. That is where the Mormons put one over. Outside of Mormon theology, man's principal superiority over woman has been his ability to beat her, but both custom and the law nowadays rather frown on wife beating—it is not considered as necessary to a tranquil home as once it was.

***Progressing Toward Equality***

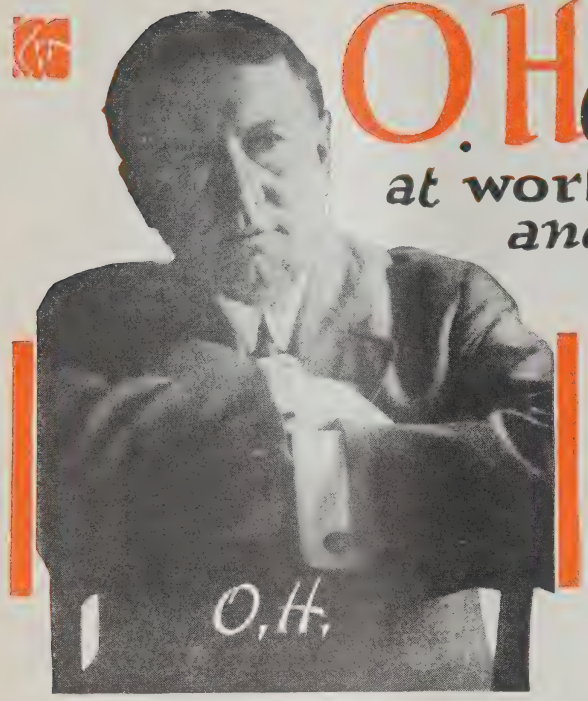
Women going out to work found that many of the jobs on which men prided themselves outrageously did not require any particular brains, or in fact much of anything aside from being on the spot. The dénouement has been complete—a vast number of women have discovered that men, on the average, do not work hard and that only a few use their brains. They have found that the mystery around many jobs is not mystery at all but merely blankness. A shipping clerk can no longer boast to his wife of the rare acumen which caused him to send to Kalamazoo and not to El Paso a package plainly marked for Kalamazoo. A flapper may, for reasons of her own, listen demurely to a man telling her what a wonder he is, but she is more apt to break in:

"Ah, act your age."

Out of all of this are coming—in fact, have come—some very definite betterments. There are fewer marriages for purely economic reasons. Young women are not searching so avidly for men who can support them. It is possible for young people to marry and by their combined incomes from work live comfortably and happily until such time as the man can command a satisfactory income. With both husband and wife working, there is an economic security which breeds liberty. Liberty in other than name is irreconcilable with poverty—the happiness of poverty has been considerably overrated.

Further than this, a girl who has worked in the past and who can work in the future will not believe the fictions of a lazy husband. The kind of man who believes that he provides for his wife as of favor is getting pretty roughly handled these days. The man who is worth anything never spends a moment contemplating his superiority—he just hopes that too many people will not find out his inferiority.

And so we are progressing, through a natural process of work, toward that equality of the sexes which laws might decree but could not obtain. That is the significance of the flapper. She is flighty perhaps, but she takes off from solid ground—and returns to it.



---

## Pioneer of the Salon

"THE beginning of the seventeenth century is marked by important advances in literary pursuits in France," says a writer on French literature. Reading that, there is imagined a kind of sporadic growth with a people turning from rough combativeness with a clear intention to cultivate the fancy and imagination. But that picture would be all wrong, for the literary movement commenced with one person, as national movements always do. That person was Catherine de Vivonne, a young woman of twenty years of age who found life at court tedious and disagreeable. So, declaring that she "would no longer attend the gatherings at the Louvre," she betook herself to her own house and decided to live her life on her own terms.

From Tallemant des Réaux we gather that the young lady had taste and originality. She was the first, he says, to have a room painted "in any other color than red or tawny brown." Blue velvet hangings with gold and silver embroideries she chose, and she also set the fashion of having separate rooms for special purposes, instead of dining, sleeping, meeting people, dancing or play-acting in any room that chanced to be convenient. For each of her guests there was a chair "or other seat, the best piece of furniture accorded to the highest in rank, and for each one present a screen as protection from the cold and draught."

So the Vivonne home became a *salon*, frequented by those interested in art and literature and the quieter things. "The idea that conversation might be a pleasure so great as to make it worth one's while to meet simply for the sake of enjoying it, had never occurred to anybody; people . . . . never met for the sake of talking"—(Jacques Boulenger). But to the new thing came poets, artists, men of taste and discernment; among them Corneille who read his works to the circle. It was a beginning and the idea and habit spread. Literature became fashionable and it became fashionable to appear cultivated. Well-bred society looked to its language and the enrichment of the vocabulary began. But the pioneer was Catherine de Vivonne.

# O. Henry at work and play

## Adventures With Editors and Others

By WILLIAM GRIFFITH

PLEASE send me $25. I've invited a friend to dinner. From the looks of him, he isn't going to pay for it; and I can't."

One afternoon in the summer of 1907 the foregoing characteristic note was delivered to me from William Sydney Porter, known to the fiction-reading world as O. Henry, and it hardly needs saying that the note was not protested. On the contrary, it was the part of editorial finesse to make a virtue of necessity on such occasions, in so far as it was all but impossible for a magazine, to which he was not already a contributor, to secure a story from the author of such inimitable tales as *An Unfinished Story, A Municipal Report, The Gift of the Magi, The City of Too Many Caliphs, Thimble-Thimble,* and others too numerous and familiar to mention.

It is fifteen years since O. Henry went

. . . on his infinite way,
Turning night into day,

and it is difficult to remember when and under what circumstances we first met. But it was sometime during the winter of 1906-7, and the meeting, which inaugurated a friendship only terminated by his death in 1910, was brought about through my desire to enlist him as a contributor to *The Broadway Magazine,* of which I had recently succeeded Theodore Dreiser as editor.

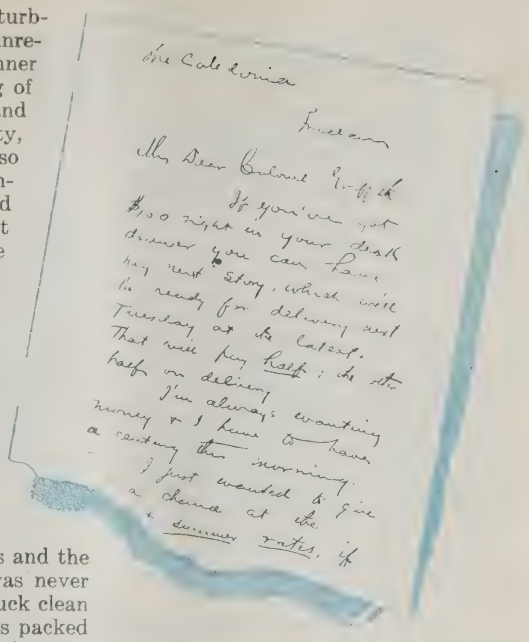
At that time O. Henry, though much sought after by the magazines, was far from being as well known to the public at large as his name is today and has been for more than a decade. Nor, in spite of his almost chronic need of money during the greater part of his creative years, was it a simple matter to secure him as a contributor; and for various reasons, valid or paradoxical. In the first place, a few publications, to which he had been contributing before and after his arrival in what he whimsically chose to call "Bagdad on the Subway," had secured prior liens on his work by advancing hundreds, if not thousands, of dollars to him for stories which had not yet been written, much less delivered. Parenthetically, it is a matter of record that O. Henry was as scrupulous in discharging his obligations to the editors for whom he wrote as he was as an artist pursuing his art. It remains to be recorded that he ever borrowed a plot, or misappropriated an idea knowingly, although in his latter years it was a custom of editors to send him outlines for stories such as they hopefully fancied would appeal to him for fictional development.

On one occasion, being in despair of a story from him to fill a yawning gap in the magazine I was editing, I ventured to suggest to him the possibility of a story based upon the idea of a Romeo cop and a Juliet housemaid having a lover's quarrel below stairs in a Fifth Avenue mansion, the master of which was an international financier. Distraught by the threatened loss of her blue-clad beau, the maid irritated the cook, who, in turn, succeeded in decocting an atrocious brew of coffee the next morning, a beverage of which the master of the house was particularly fond. As a result, the latter took his wife to task for having such a cook, and was properly cautioned as to the limitations of his province, domestically speaking. Arriving at his office with his temper ruffled, the financier was to preside at a board meeting to consider an international transaction which might involve the country in war, and so on. O. Henry listened patiently to the warmed-over Mother Goose suggestion, and remarked,

"Not so bad, in its way; but I'm afraid it would curdle the ink."

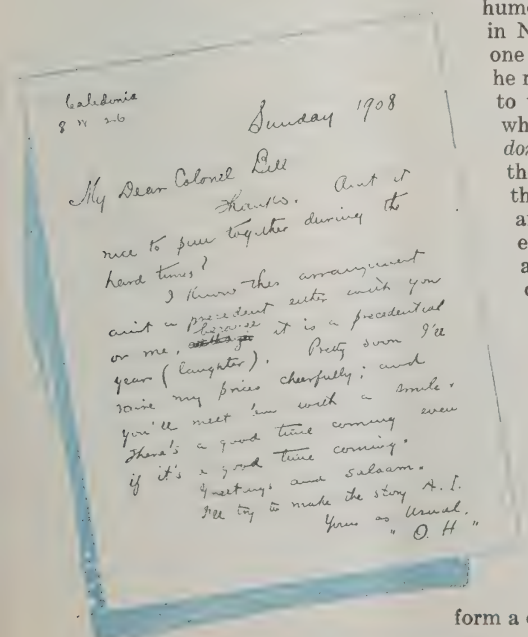
Apropos of his becoming a resident of New York at the age of forty, many accounts have been given. I am repeating his own in saying that he had for some months been staying with relatives in Pittsburgh, Pennsylvania, when he was invited by the editors of *Ainslee's Magazine,* to which he had contributed several stories, to go to New York with their guaranty to take at least one story a month from him at $100 each. He accepted the invitation, with the proviso that he be paid for the first story in advance. To the surprise of the editors, the publisher of the magazine authorized the advance payment, and a check was duly forwarded. A week passed, with no word from Oliver Henry, as he then signed his stories. But presently a letter arrived, explaining that the $100 sent him had mysteriously evaporated, and asking for another hundred. Again the publisher authorized the money to be sent, and in the course of a day or two O. Henry appeared. After meeting the editors, to quote himself, "They escorted me, with fear and trembling, to the office of the publisher, Mr. S——, who abruptly dismissed them, closed his office door and motioned me to a chair. Fearing the worst was yet to come, I hastened to thank Mr. S—— for his generosity, and assured him that his confidence was not misplaced.

" 'Don't mention it, my dear sir,' he rejoined. 'I was born and brought up in Pittsburgh, and was only too happy to assist in your escape.' "



As to the origin of his now famous pen name, O. Henry once told me that he was in New Orleans when he began submitting stories more or less regularly to metropolitan publications, and that he had hit upon his pseudonym in this manner: One morning after the annual Mardi Gras ball in New Orleans he was reading the *Picayune* and his eye was arrested by the columns of names of those who had attended the ball. The surname Henri was predominant, followed by that of Olivier. He anglicized them to Oliver Henry, later abbreviating the Oliver to O.

O. Henry could not be prevailed upon to meet a man simply because the man was a celebrity nor, when he himself became a celebrity, would he tolerate being treated as such if he could help it. Many times, to my knowledge, would he decline flattering invitations to out-of-town week-end house parties attended by distinguished



guests, preferring, we will say, to remain in the "City of Chameleon Changes" over Sunday, for fear, as he was wont to remark, "it will put something over on me in my absence." As his biographer, Professor Smith, observes, there was never a moment of his stay in New York when the then four million were not more interesting to him than the Four Hundred. One self-protective device that stood him in good stead was a sort of pan-American dialect which he adopted on such occasions and which served as a deterrent to prospective annoyers. Thus a woman, who had written to him about his stories and who insisted on bringing a friend to meet the great man, said to him afterward: "You mortified me nearly to death, you were so ungrammatical." Another method of evasion was to drop into a perfectly serious vein of Artemus Ward rusticity. There was humor in it to those who knew him well, but it was meant for those who sought him out of curiosity, and they frequently were disillusioned.

But with a congenial companion O. Henry was more interesting than his stories. Almost all, however, who have written about him mention his barrier of initial reserve. Till this was penetrated —and he had to penetrate it himself by sensing a potential friend in the casual acquaintance—there was no geniality. I am not of the opinion that this was due to innate modesty, so much as to his natural disposition to be a looker-on, rather than a personage, in his Bagdad. To have been a cynosure or a personage would have meant distraction from his work of taking notes for future reference and use in his tales.

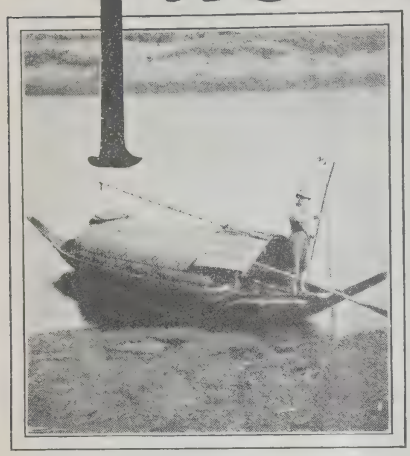
A mutual friend of ours, a distinguished woman novelist, confesses that her first impression of O. Henry was one of disappointment. "He struck me as stolid and imperturbable in appearance and so unresponsive and reserved in manner that I had a miserable feeling of being a failure as a guest, and nothing hurts a writer's vanity, a woman writer's anyway, so much as to have her work considered more interesting and attractive than herself. But presently he began to sparkle . . . Unquestionably he was a great *raconteur*. Had his table-talk been taken down in shorthand, it would have sounded very much like his written dialog, only it was not circumscribed and curbed by the limits of the story and the necessity of keeping the narrative uppermost . . . His wit was urban, sophisticated, individual; quite free from tricks and the desire to obtain effects. It was never mordant nor corrosive, but struck clean and swift as lightning. It was packed with world-knowledge, designed to delight the woman of thirty or forty, not of twenty, and yet I never heard him tell a story even faintly *risque*."

It was after our acquaintance had deepened into friendship that O. Henry related an anecdote illustrating his early attitude and feeling with regard to life in the city of his adoption. It concerned a Texas character—a cattleman who became an oil baron overnight—who, for the purposes of the story, may be known as Colonel Nettlesome. As a cattleman in the Panhandle country, he had developed a capacious appetite for canned lobsters, the only variety then known in those regions, and promised himself a trip to the Atlantic seaboard and a lobster spree whenever fortune permitted. The advent of a rich oil gusher on his land enabled him to humor his ambition, and on arriving in New York and "putting up" at one of its most celebrated hostelries, he repaired to the dining room and, to the consternation of the waiter who attended him, ordered a *dozen broiled lobsters*. Asked by the waiter to repeat the order, the Colonel did so emphatically; and repeated it with even greater emphasis when the head waiter appeared on the scene. In the course of twenty minutes the doors leading to the kitchens were swung open, and in marched twelve waiters each bearing a resplendent salver on which reposed a lobster. "Life in Texas in those days," observed O. Henry, in telling the story, "was conducive to quick thinking; and no sooner did those waiters heave in sight than the Colonel decided what to do. He motioned them to form a circle around his table, and after proper deliberation pointed toward one of the delectable crustaceans, and announced, 'Serve me number seven.'"

His own whimsicality and quick-wittedness impressed me one raw November evening while we were walking down Sixth avenue, from his workshop, so to say, on West Twenty-sixth street, to Washington Place where we were next-door neighbors. At Twenty-third street our progress was interrupted by a nondescript collarless character possessed of a thirst that he was financially unable to assuage. Instead of giving him money, O. Henry ushered him into a haberdasher's, selected the most flamboyant red necktie on display, and instructed the salesman to put it on the derelict. The salesman hesitated, inquiring, "Aren't you going to get him a collar?"

"No," chuckled O. Henry, "I don't want to take away all his ambition."

On another occasion he was dining with me in my apartment, adjoining his own, and after dinner we thought of recruiting some neighborhood acquaintances for a game of poker, a game which rivaled bowling in his esteem as a nocturnal recreation. Using a desk telephone, O. Henry was talking to one of the required guests, who feared he couldn't join us because he and his wife had three guests for dinner. Stroking my Angora cat, which was purring around the telephone, O. Henry could be overheard announcing, "You're in the minority by six; there're eleven of us here."



One of the earliest letters he wrote me bears simply the date of Friday, the summer of 1907. It was written from the Caledonia Apartments, in West Twenty-sixth street, New York, where O. Henry occupied for some time a small apartment in which he did most of his writing. In addition to revealing his chronic

# The Parasite Hunters

## Saving Crops by Insects That Eat Other Insects

By WILLIAM ATHERTON DU PUY

An American parasite hunter in the back country of Assam, looking for an insect that would attack the citrous white fly.

THEY were Americans, doing this strange thing, and the peasants were, therefore, not greatly surprised. Americans, they held, always acted queerly. Yet that they should collect caterpillars, that they should employ hundreds of Frenchmen to help do it, was hard to understand. Then some wise old peasants offered a satisfactory explanation. Was it not known that one in a million of these caterpillars had a jewel in its head? Was it not known, also, that Americans were money mad? They were, obviously, collecting caterpillars for these jewels.

Far back in the hinterlands of China where there are only footpaths, other Americans were digging up little shrubs, putting dirt and moist sacks about their roots, hiring coolies to carry them hundreds of miles down to the sea on their backs. Yet these were but wild shrubs and the Chinese knew full well that there was nothing of value about them. They, like the French peasants, could not understand. Like the French they reasoned according to their lights. They had known men who hunted shrubs for the medicine they made from them. These strange men from the other side of the world, they concluded, were medicine makers.

But, in fact, they were neither jewel hunters nor medicine makers. Their mission was stranger than either of these. It was tiny insects, possibly so small that they could be seen only with a microscope, that these Americans sought. They were in each case after a very peculiar insect which they wanted to use for a particular purpose. They were after particular insects that lived upon other particular insects. They were looking for parasites to fight some insect that was injuring crops in far-away America.

This expedition to France, for instance, was gathering gypsy moth parasites. The gypsy moth's caterpillars were eating leaves with such rapidity in New England that the very existence of the forests was threatened. These moths had come to America from Europe and were frightfully abundant. There were still a good many of them in Europe but not enough to do any great harm. They did not develop in such numbers over there.

Colosimo, the caterpillar-eating beetle, introduced from Europe.

They were fewer in numbers in Europe because over there they had parasites that kept them within bounds. But the moth had got to America without its parasite. There was no restraining influence in America which was the reason it was so destructively numerous. The thing necessary to stop it, the scientists knew, were the parasites that were present in Europe. So, when these Americans gathered caterpillars in France, it was not caterpillars but parasites they were after. They were selecting caterpillars that were infected with parasites. Inside each of these millions of caterpillars there were tinier insects that were feeding upon them. Their mothers, little wasp-like creatures, had laid eggs in the caterpillars, knowing that they would hatch out and that the young ones would begin to bore from within. The Americans got the caterpillars while the parasites were in them, and hurried them away to America. When the parasites came out, when they became wasps, they would be over there where the caterpillars were uncontrolled. They would go forth and lay eggs in American caterpillars. Thus would they start new (Continued on page 22)

Shipment of parasites coming down to the sea from Interior India on their way to America to take part in the insect war.

A consignment of parasites arriving from abroad for distribution to farmers and fruit-growers in combating pests.

# Robbing the Public by Post

## Some Modern Methods of "Stand and Deliver" Which the Mails Make Possible

By AARON HARDY ULM

A YOUNG woman, suddenly left a widow with a babe to care for and no funds, saw in a rich and reputable newspaper an advertisement for persons to do easy and profitable work at home. She answered the ad and received a lot of florid literature, the purport of which was that, if she would send the advertiser $100 for a knitting machine and raw material, the product of her labor would be paid for at good prices by the concern. She did not have one hundred dollars. But a neighbor volunteered to care for the baby while the mother clerked in a five and ten cent store long enough to earn the sum which, when in hand, was forwarded. The machine came. Over it she bent for many weary hours and produced many bundles of socks and gloves. These she sent to the concern but to this day she has not received a penny for them.

She is only one of many thousands who, during the last dozen years, have been defrauded by that "home work" scheme operated at long distance via the United States mails. Most of them, like she, were pitiably situated, being shut-ins on account of fatherless babies that had to be cared for, or invalidism—many of them cripples—without means of support.

"This type of home work scheme is the most vicious and despicable imaginable," says the Better Business Bureau of the city from which the one in point was operated.

Several concerns that have employed the scheme have been the subject of investigations; the promoters of at least one of them have been indicted. That concern operated over a period of a dozen years, doing a business totaling around $6,000,000. Its securities were listed on the New York Stock Exchange. Its advertising was prepared and placed by a large and "legitimate" advertising agency and was run by many of the "best" newspapers and magazines in the country.

***What Two Vital Go-Between Mediums May Do***

Proceedings against the promoters no doubt will be pressed vigorously by the Federal Government and outside agencies, like the *Better Business Bureaus*, that are coöperating in the premises. The mails probably will be closed to them; they even may land in prison. *But if anything of account is being done with reference to the advertising agency and the newspapers and magazines which aided and abetted the fraud, it is not of record discoverable by this writer.* The two vital go-between mediums—the "legitimate" advertising agency and the "reputable" publication—make possible the promotion of the bulk of mail-fraud schemes by which the American public is deprived of a billion dollars or more a year.

But for these two go-betweens, an authority on the subject tells the writer, at least 90 per cent of the volume of mail-frauds could not be perpetrated.

Though organizations of advertising men have done much good work in combating these frauds, and organizations of newspaper and magazine publishers, as well as individual publishers, constantly have pledged adherence to honest advertising standards, it is superlatively easy for any mail-fraud operator to procure all the "aiding and abetting" he needs from both advertising and publishing realms. And he is not limited to the underworld strata of either. Some of the biggest of the advertising agencies have sold skilled service for most specious mail-fraud schemes. And numerous periodicals of the highest "moral" tone in so far as reading matter goes—including not a few devoted to religion alone—have been among the worst offenders in the running of notoriously dishonest advertising "copy."

***The Offense of Aiding and Abetting***

This doesn't mean that all advertising agencies will prepare and place fraudulent advertising or that all newspapers and magazines will run it. Many will not do so—at least knowingly. But other advertising agencies will handle it and numerous periodicals will publish virtually any advertising for which they are not "liable." Publications clearly are liable for obscene and lottery advertising, on account of which they may be thrown summarily out of the mails. But for lying, even viciously fraudulent advertising, the liability of neither the advertising agency that prepares and places the "copy" nor the periodical which publishes it has been definitely established in law. There is a Federal statute, however, which would seem to fix liability on both. It reads:

> "Whoever directly commits any act constituting an offense defined in any law of the United States, or aids, abets, counsels, commands, induces, or procures its commission, is a principal." (Section 332, Federal penal code as revised and adopted in 1909.)

Under that statute a person who merely worked as a clerk for a mail-fraud operator was convicted as a principal in the commission of the crime.

Then there is the conspiracy statute, making it a felony to "conspire" to violate Federal laws.

Both of these statutes have been invoked against "aiders and abettors" in offenses against the Federal Government, notably some arising under the Volstead Act. But in so far as can be found neither of them has ever been invoked against an advertising agency or a publication that assisted in the perpetration of a fraud via the mails. One once was invoked against a printer whose specialty was circular matter for the use of mail-fraud operators. He did more than merely print the stuff; he helped to write the "literature" and to form plans of operation, even to the suggesting of schemes. He was not punished, having saved himself by turning state's evidence.

***Something About Fake Gland Treatment***

As close relations frequently exist between advertising agencies and mail-fraud operators, there has arisen in several cases a strong suspicion of the existence of even a financial, if not a partnership, alliance between the agency and the ostensible promoters.

In any event, advertising agencies that serve these crooks do more than merely attend to the details of placing "copy," as they do when they serve legitimate advertisers.

Recently, for instance, the mails were closed by a fraud order to a concern which marketed, with much profit to the promoters, a fake "gland treatment." The chief promoter was a young man in his early twenties. The affair was put over by advertising which was accepted by many periodicals.

"It (the fraud order) terminates an advertising campaign, the object of which was to promote and trade upon the kind of superstition which leads the savage to eat the heart of a slain tiger in the hope of increasing his own courage and ferocity," says the report of the National Vigilance Committee on the case.

"The products sold were compounded for the advertiser by a manufacturing drug establishment, advertised by the ——— —. ——— Advertising Agency of ———, and sent out indiscriminately to purchasers by a staff consisting chiefly of young women employes."

"Apparently for the purpose of overcoming the resistance of newspaper publications to such flagrant copy, the ——— —. ——— Advertising Agency prepared and issued a booklet over the pseudonym of 'Walter Van Henry' which purported to be a treatise on gland rejuvenation . . . In this, as in other material employed, the occasional references which were made to the opinions of acknowledged scientists were wrenched from the con-

text in such manner as to distort and in some instances even reverse them entirely by the omission of every qualification."

The "laboratories" were found to be imaginary only. Before the authorities interfered, the promoters did a business totaling around $300,000.

"Judging from the numerous full-page spreads (solid pages of display advertising) which were employed," says the National Vigilance Committee, "a large part of the money coaxed from ailing and senile persons went into the cash drawer of the publishers who accepted this advertising copy."

Though the advertising agency is mentioned in the report and in the findings of the Post Office Department, the publishers who coöperated in perpetrating the fraud are not of record.

Even the mention of the agency is exceptional. This rarely is done, even though in a large proportion of the worst cases advertising agencies serve as intermediaries.

***Several Kinds of Agency Recognition***

They thus serve because an advertising agency, especially if "recognized," is presumably responsible. The publication looks to it rather than to the advertiser for payment of bills. Much advertising that is sent out by an agency will be accepted when if sent direct by the promoter would be rejected—particularly if not accompanied by cash. There are several kinds of agency "recognition." The chief one is that given by the American Newspaper Publishers Association. Another is membership in the American Association of Advertising Agencies, which fixes the ethics and standards for that branch of advertising activity. Members of these associations have very seldom been associated with advertising campaigns found to have been fraudulent.

What is done when an agency is found in the service of mail-order crooks? Almost nothing, in so far as the writer can discover. In specific cases, he is told, they are warned, and are advised to drop the accounts in question. The best agencies invariably drop such accounts when advised as to their fraudulent nature. Obstinate ones sometimes have to be told of the existence of section 332 of the Federal penal code, quoted above.

The agency and the publication usually plead ignorance, and it may not always be easy to overcome the plea in court.

***Invariably the Copy Bears Certain Earmarks***

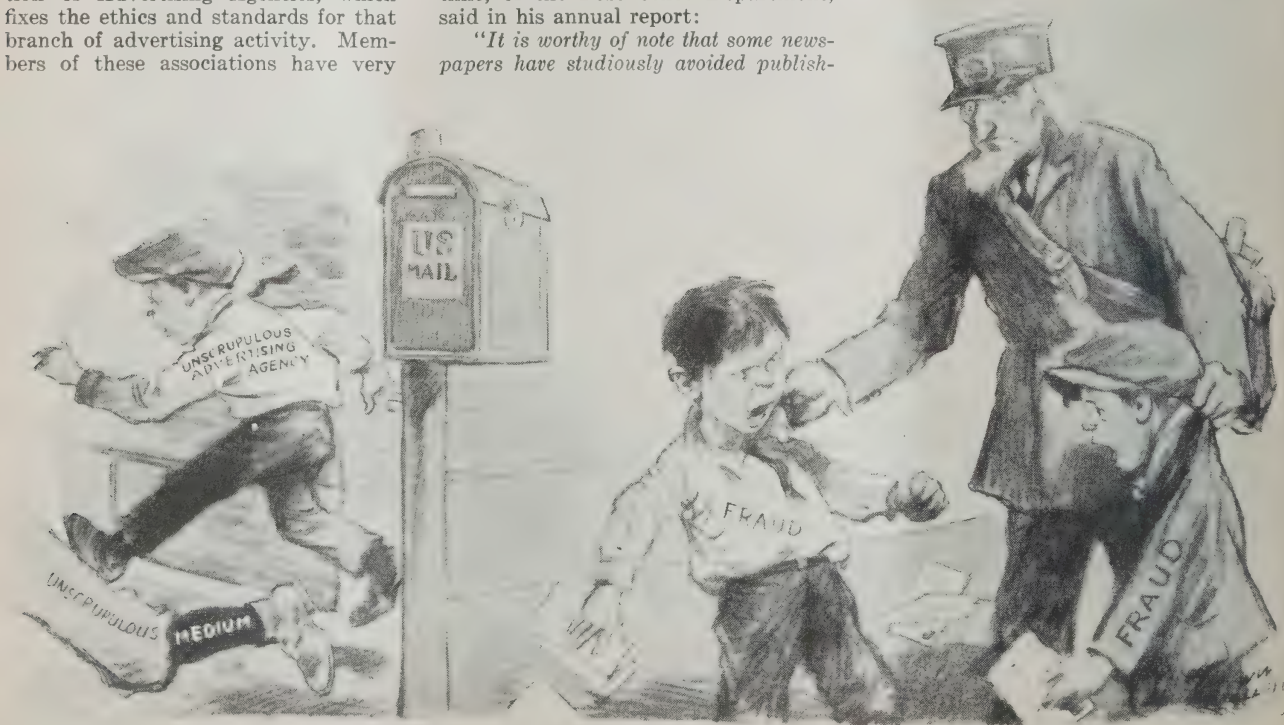
"We accepted our client's or the advertiser's statements as true," they say, "and had no reason for doubting them."

A good defense in law perhaps, but a fallacious one in morals. Any advertising man of sufficient skill to qualify him for agency work, or to handle advertising for even a small newspaper, can spot outright fraudulent advertising on sight, nine times out of ten. Invariably the "copy" bears certain inescapable earmarks, which have been widely advertised to the advertising world by establishments like the National Vigilance Committee.

They have not been so widely advertised among the general public. In fact there is a very little general publicity on this subject; not nearly so much as it deserves as mere news or interesting information.

A few years ago the Solicitor, at that time, of the Post Office Department, said in his annual report:

*"It is worthy of note that some newspapers have studiously avoided publishing any matter relating to the issuance of fraud orders."*



Writing of "blue sky" or fake stock kinds of mail-frauds, Rush D. Simmons, chief Post Office Inspector, said recently:

***Then There Is the Endless Chain Scheme***

"Whenever the Post Office Department secures convictions in fraud prosecutions, the newspapers give a great deal of space, as a usual thing, to the cases; but they do not generally publish the details of the schemes and methods of the promoters. They seldom describe or quote from the fraudulent advertising material, or comment on the selling arguments that were successful in floating the worthless securities. They play up all the dramatic incidents of the crimes and trials, but they fail to give an appreciable amount of information as to how the stocks were sold."

Recently, for example, a relatively new form of mail fraud, now being widely exploited, was attacked by the authorities. It is known as the endless-chain scheme. You buy a coupon for one dollar. This gives you authority to buy three other coupons at one dollar each. You sell these to three friends, who then can buy three each for sale to three friends of theirs. When your three have made their purchases you get ten dollars' worth of silk hosiery or other articles, and the ones you sell to can do likewise when the ones they sell to carry on the chain. It looks easy; when the authorities stepped in, one concern was taking in over $1,000 a day on this scheme. Its impossibility lies in the fact that if a single chain

# MR. FORD'S PAGE

THE country is no longer afraid of mere bigness in business, as once it was. It has become generally clear that any business that performs a national service is necessarily big, though the single point in which it serves may be relatively small But there still remains among those who theorize about business a clinging distrust of bigness, a subtle distrust of size.

This fear and distrust would, of course, be justified if any single industry, or even the whole combination of industries, grew larger than the people, or threatened to seize more power than the people have. There are those who claim that this is just what our industrial order is doing—overtopping the people, usurping power. No doubt it is in human nature to do these things when possible, but under our method of living it is not possible. Human fallibility which makes possible the ambition, also makes impossible its achievement. That is one defense. The other is this: every despotism, in religion, government or business, raises its own triumphant rival.

It is probably unnecessary to go over again here the fact that bigness is more dangerous to the institution that has grown big, than to the community at large. For no institution grows large save by the support and patronage of the community, and that support is not given except in return for equivalent service. Yet, there comes a point in businesses which have grown artificially large where their essential bigness becomes a burden, where human ingenuity and managerial ability fail under the load. Corporations, trusts, mergers, may be piled one on top of the other and the resulting structure may look very imposing, but at the same time the managerial ability required to operate the giant concern has probably not been increased one whit. You may artificially, by bankers' means, build a gigantic world trust so called, but it does not function. It begins to crumble. It is too big for the men who built it. We have witnessed that in our own country often enough to know the truth of it.

We are speaking of industry, of course. Finance is different. No great business ability is needed in finance. Financial pyramids mean nothing. And they are coming to mean less and less.

Now, in addition to the dangers of artificial enlargement (natural bigness in business has its own natural limits) there is always the fact of competition. Theorists say that big business is the death of competition. On the contrary, big business is the motive to big competition.

"Oh," say the theorists, "big competition exists only for a time; then both big competitors merge, and they have the public between them." Indeed! It is a good line in a speech but it is not true to the facts. When big competitors merge it is because they both feel themselves slipping. Not only have they failed successfully to compete with each other, they have failed to compete with the public estimate of the service that should be rendered.

*SOME men defend competition as if it were in danger, or needed a public vote for permission to exist. Competition cannot be abolished; every attempted monopoly is an added impetus to a whole round of competitors. Big business, so far from destroying competition, only raises up bigger competitors. The bigger the stride toward monopoly, the bigger the compensating competition. Our economic observers seem to overlook that. Monopoly is beset on two sides; the Law is against it; the world was never given to one man, or one method. Big parasites are curbed by big competition. The bigger the attempted grab, the bigger will be the control.*

The contention that bigness in business destroys competition is quite false. We are accustomed to think of parasites in a descending series, growing ever smaller:

"Great fleas have little fleas
upon their back to bite 'em,
And little fleas have lesser
fleas, and so *ad infinitum*."

But competition cannot be regarded as parasitic. True competition is not, at any rate. Its best function is to keep service at its topnotch of quality. Even when it acts as scavenger, tearing down what cannot remain standing, it serves a good function. But—it is the public that pays for competition, just as it pays for monopoly. Better the former than the latter, whatever the difference in price, whether more or less. Competition very probably costs more; it is worth it.

There is no need, however, to think that the bigness of business diminishes the possibility of competition. Not at all. The couplet quoted above is not complete:

"And the great fleas, themselves in turn, have
greater fleas to go on;
While these again have greater still, and greater
still, and so on."

Nothing gets so big as to be beyond the two laws here noted, that managerial ability must equal assumption of power, and that competition keeps pace with initiative in every field. Size may be an impediment, but monopoly in any real sense is an impossibility. It offers a universal target. Its challenge is irresistible. Monopoly is of such a character as naturally to inspire in men the desire to grapple with it.

In emphasizing the bigness of attempted monopoly, economic observers have failed to notice the consequent increasing bigness of competition.

## *Still Another Peace Plan*

IN THE south of Europe there are certain volcanoes—Vesuvius, Etna, Stromboli—which are more or less active all the time. If not actually in eruption they are rumbling and threatening and belching forth black smoke and poisonous gases and causing unrest and uneasiness among the people in their vicinity. When an eruption takes place the surrounding country is made desolate and there is loss of life and property.

In the south of Europe also, among those peoples who dwell in the Balkan States, there are frequent mutterings and threatenings and outbursts that may or may not involve the other nations of Europe, but far too often do. From a very early period this part of Europe has been the breeding ground of trouble. Within the past half-century, or a little more, nearly all the wars, nearly all the uprisings and killings and massacres that have halted civilization and filled the graveyards have had their origin here.

The causes which led up to the Crimean War had their origin in the Balkan Peninsula. The "Bulgarian atrocities" of the seventies of last century led to the Russo-Turkish War and Plevna; then followed wars between the Greeks and the Turks, and the Turks and the Bulgarians, and the Bulgarians and the Greeks, and the Serbians and the Austrians. That last was the biggest eruption of all, it spread over the world, and the world still suffers, and will suffer for years to come, from that awful cataclysm.

And still, at Constantinople, and Sophia, and Athens, and Belgrade, in remote chambers and cabinets, there are being hatched plots and counter-plots aimed at further disturbance of the peace of Europe—and of the world at large. The same volcanic rumblings go on, the same poisonous counsels prevail, the same provocative invasion of frontiers and firing of shots.

Preserving peace, or preventing war in the Balkans, would seem to be the first self-defensive act of Europe.

## *College Humor*

HAVE you seen any of the alleged college humorous publications? They contain three themes: beating the profs, sex and booze.

We are willing to accept all of the frank things the youngsters do, and heaven knows they are frank enough. Low necks and short skirts no longer shock us. We refuse to be thrilled or startled by lack of underwear (even in cold weather) and dehosed knees. Even paint calcimine, enamel and slaked lime cannot hide the youth in their faces. Back-slapping and rough-housing, sex versus sex, though boisterous, is not deadly. But the consciously half-hidden, half-revealed smut in the college magazines would make Rabelais blush and it is said that he was some smutter in his time. Rabelais was rather open with his offense, however. It could be got at with a broom, or a cake of soap, or a spray full of disinfectant.

## *Maybe You Have Never Thought of This*

EVERY year or two we have to take a college course in anthracite coal. That is what a coal strike is. We pay for it in higher prices and inconvenience. What are we learning from it?

What is there to learn? There is this: A strike in the production of an essential commodity is the most absurd and grotesque of wars. Though neither party has anything against the public, both bring the consequences of war to it. The miners say they will mine no coal, but every day they consume things that the rest of us make and without some of which they could not live. They refuse to give us coal, but they take the groceries, clothing and other things that we continue to produce. The operators do the same. If we were to shut down upon operators and miners and refuse them everything that we make so long as they refuse to provide coal for us, they would have to resume the mining of coal. This is a world of interdependence in which no man is sufficient to himself. If coal miners or other groups are not willing to work for us why should we continue to work for them, merely to enable them to continue their warfare against us?

But this method is out of the question. Nobody, if he could, would suddenly shut off food and everything else from a population of hundreds of thousands of men, women and children. And if we could we wouldn't unless we were prepared to deal with something like a revolution. What is to be done?

If we would end strikes we must recognize our responsibility to those who provide us with the essentials of life. We must see that they get a square deal. We must go further and provide the social machinery to give them

a square deal. Tyranny in the form of law will not do. There must be justice. Both sides must be made to feel in their hearts that the social judgment is just. But to do this we must agree upon an underlying principle of justice upon which all settlements shall be made. That principle must embody this fact—that every worker is entitled to a wage sufficient to enable him to live decently, to enjoy some of the modest luxuries of life (which are now coming to be regarded by everybody as necessities) and to save something for his old age. If each of us wants the coal and the other necessities that our fellows produce, it is our duty to see that they get a square deal while they are working for us. And that is exactly what we do not do. Hence, strikes.

## *The Negro*

THE Negro is a human being. Under the Constitution his rights are precisely those of any other citizen. And so are his obligations. These are not all the facts, but they are important facts. Of importance too is the fact of Race, which is not understood as yet; indeed, attempts to understand it are scorned and denounced, and efforts are made to suppress it. The fact of Race cannot be suppressed. The fact of Race does not concern the Negro alone. All the Race Question that can possibly exist rises from suppressing the fact, not from facing it. It is one of the strangest aspects of our ignorance in these matters that we conceive the realization of Race to be the origin of the Race Problem, when really its origin is the attempted suppression of that realization. Races are here. They differ. Each has its function. Superiority is not a matter of argument but of achievement. Inferiority is not decided by achievement but by opportunity. Race lines are fixed. Nature punishes transgression with destruction. These are facts. And Race Rights are also facts.

The turn which the Negro's problem has taken in this country is interesting. Formerly the plea was made that he was deserving of assistance. He was regarded as a protégé who needed and expected help. The collection plate and the uplifters' program always hovered near him.

It is now emphasized, however, that the Negro might help himself. Given industrial opportunity he becomes a good worker. He is a good family man, though all too frequently he suffers in general esteem from the prevalence of rowdyism among his own race in some of the larger cities. At present he is restricted to those residence districts from which white people are moving away. Notwithstanding the fact that a highly respectable and valuable type of family life exists among Negroes, it is too commonly the practice of municipal authorities to segregate alongside the Negro settlement any special form of outlawry which police-politics may condone. When, to escape from this condition, Negroes seek respectable surroundings in districts inhabited by whites, difficulties ensue.

These conditions point clearly the way for the next step of self-help, namely, the establishment for themselves of communities where their families may be reared under the best and most congenial influences and where their rights as citizens may be wholly enjoyed. It is practically hopeless to attack as "prejudice" the real opposition which exists to mixing the races. The Negro does not want to crowd in among the whites; what he does want is the air, sunlight, space and sanitation which are to be had in white residential sections. He should have all these things in his own quarter. He can have them if he will intelligently construct such communities and render them illustrative of the virtues of his race at their best.

## *Ads for Cigarets*

"ASK DAD," advised the cigaret ad. And he will tell you not to. But they are getting around Dad by ringing in the authors to keep the cigaret tips burning. Will Rogers writes the ad and takes the fee, but honestly says that he doesn't use the stuff himself. Latest among the professional fag boosters is Irvin S. Cobb. He goes on talking about maple sugar up north. The melty days when sap drips into the pails; snowy New England groves; maple syrup, maple sugar, the essence of northern forests and winters and springs. That, he says, is like tobacco. Flavor of maple syrup; fragrance of tobacco. Mr. Cobb says he has not written advertisements for "manufactured products" because in doing so he would only feel like "a hired hand" exploiting this or that commodity "for so much a word." But with this special brand of cigarets, it is different. It gets to his heart.

Now we know what fame is in America, what its apex. It is to become admitted to the Cigaret Ad Writers' Union.

## *Fall Games*

CAMPAIGNS are over—for this year. What were they? Mostly competitions between sides, between groups of friends, each for its favorite's chance at a public job. In the meantime, the Commonwealth had no partisans. The autumn football season decides something; would that as much could be said for the autumn political games. Vote for Jimmy; vote for Harry; vote for Dick. When shall we begin to vote upon the highest community issues?

***The Man from Chicago*** dropped into The Office, and somehow the talk fell upon Germans. And then it turned to his imprisonment in Germany for five months, and the pitting of American against German wits. "Sometimes they were very clever," said he in describing their efforts to trap him, "but mostly they were just—German." Naturally, the German sense of superiority and the American's sense of the same clashed.

"The worst thing about solitary confinement is the gnawing desire to see or hear something familiar," said the man from Chicago. "I had a jailer who had a long white beard and looked like a saint, but he was the very devil for thinking up silent torture. I had nothing to read. I wanted to keep my wits about me, for they were continually trying to trick me into statements that I did not care to make. They wanted some little thing to hang on our Government, and I had to be on my guard. I had to keep my mind at normal. Then I began to draw out of my mind much of that with which I had stored it. With my thumbnail I scratched on the whitewashed wall the words of Lincoln's Gettysburg Address. There grew upon me a terrible thirst of mind for a sight of the American Flag. If I could only see something familiar, like the Flag, it would be a great thing. So I made one. It took weeks of time, but I made one out of waste paper. The red stripes I made with jam. I hid the Flag in my cot, but I think it helped to keep my mind straight. It was a terrible experience, but now that I look back upon it I can see where it had advantages. The United States as a great Idea in the world never stood out so clearly for me, as it did then. I saw how little one man's life is worth when it comes to the preservation of a Free Nation. I felt myself one of America's defenders, even in that German jail. For that reason I would not stand up for their judges or generals when they came to my cell. I was an American! Let them do their utmost, they could not take that from me."

***The Man from the East*** dropped into The Office, looked at a copy of *Harper's* and remarked he was glad Dayton, Tennessee, was getting fair treatment at last. The deluge of New York abuse has collided with the fair-mindedness of the American people, and Tennessee is coming through.

"Of course, I don't agree with Dayton's theology or science, but its Americanism and its moral sense are admirable beyond words. I knew Bryan well, and I know Darrow. I can understand how, after a week of Darrow, Bryan should die. No, I don't intend that facetiously. Bryan never in all his life had such a glimpse into the abyss, into the profound negativeness of unbelief that was given him by Darrow. Bryan had a Dantesque experience. I think it killed him. He had no argument against it. There is no argument. He had no force to oppose it. There is no such force. It must kill itself, and it will. Darrow not only does not himself believe, but he is not willing that anyone else should believe. I can see his intellectual processes and understand them, and to a certain extent sympathize with them, but the effect of it all is poisonous even to me, his friend. Darrow himself appears to stand it very well. But the atmosphere he generates is dangerously depressing to some types of mind. I can stand it about an hour. I think Dayton whipped Darrow. Not Darrow's position in science, but Darrow the servant of the Everlasting Nay, as Carlyle would say. I wouldn't be at all surprised if Dayton should be the last considerable item in Darrow's public life."

***The Man from down York State way*** dropped into The Office and remarked that the book business was not so good this year. The best sellers were not selling so much as they did. A book that formerly would sell 150,000 copies was lucky this year if it rose to 100,000. Publishers and booksellers were feeling a little neglected by trade. The cause of the slump might be anything from automobiles to radios. Our Caller, who is himself an author—a novelist, in fact—thought maybe it was due to the dishwater that was served up as fiction.

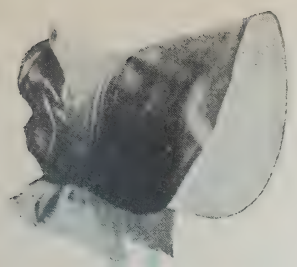
"The old books are selling better than the new ones," he said. "I was with a group of men the other day and about the only thing they raved about was *Huckleberry Finn*. They talked of it with all the gusto that a great new book gives. I was with a publisher the other day who told me a bit of news about Louisa M. Alcott's *Little Women*. He said that all New York public libraries recently had to restock that book, and what do you think the order was? *Thirty-seven thousand copies!* Of *Little Women!* And in New York!"

"Well," said I, "that's the best piece of literary news I have heard in a long time. With Juvenile New York making 37,000 copies of *Little Women* necessary in the public libraries, New York may yet be admitted to America."

## "The Champion of England"

IN WESTMINSTER ABBEY, where kings are crowned, where lie the makers of empire, warriors, statesmen, poets; where are commemoration tablets of England's mightiest and noblest, there is, on the wall of the West Cloister, a stone with an inscription that reads:

Beneath this Tablet Lie the Remains of
Mrs. Elizabeth Broughton,
Died 7th December 1784
Aged 59 Years
Also of Mr. John Broughton,
One of His Majesty's Ushers of the
Yoemen of the Guard
Died 8th January 1789
Aged 86 Years.



The John Broughton thus honored was at one time England's prize ring champion, who, born in 1704, began life as a Thames waterman, studied the art of boxing under a certain George Taylor, challenged and defeated his master in a fight with bare fists, opened a gymnasium and boxing school which was patronized by royal and fashionable folk, and was vanquished in April, 1750, by Lee Slack. His title to fame rested in his invention of boxing gloves, which, he assured his patrons, would "effectually secure them from the inconveniency of black eyes, broken jaws, and bloody noses," and, later, in the framing of a set of rules designed to discourage "unfriendly" practices in the ring. The "unfriendly" acts so denounced were "gouging, or forcing out the eye on an antagonist with the thumb," "the kicking of a man with nailed shoes," "the administering of punishment till life be extinct."

After his retirement from the ring, Broughton was appointed officer in the Yoemen of the Guard, and, according to some authorities, became a verger of the Abbey. At one time it was proposed to add the title "Champion of England" under his name, but the ruling Dean of the Abbey objected.

## Pita Floja Fiber Plants

THE first shipment of pita fiber to reach the United States recently landed in New York Harbor.

Pita floja fiber plants grow wild in many regions of Colombia. Its leaves attain an average length of fifteen feet. The fiber is of a very fine structure and, weight for weight, it is stronger than steel. It has an elasticity of one inch to the yard, has extraordinary resistance to the salt water and is easily dyed. It is divisible into one ten-thousandth of an inch and its ultimate fiber is about one-half inch longer than flax. Large tracts of the plant are found up the tributaries of the Magdalena and Atrato rivers in Colombia.

# "Grandmother's Band Boxes"

## Their Origin, and What They Held

By MARY HARROD NORTHEND

WHEN searching for things procurable, artistic and novel to use in house decoration, have you ever considered the advisability of the old-fashioned bandbox, with its pictured exterior, which may be tucked away and forgotten under the eaves of your attic? Decorative in design, they possess a distinct individuality and charm; fashioned of pasteboard, covered with hand-blocked paper, finished in gay color scheme, with one set of pictures on the side and another on top, they are surely very unique.

When did they first come into fashion and why? Old-time chroniclers tell us little, save they were not a feminine contraption, but designed for protection of neckbands worn by the eighteenth-century beaux. Ruffled shirts, and knee breeches demanded ornamental neckwear, thus wonderful creations with foundations of buckram covered with satin, silk and velvet, came into vogue, trimmed with rich lace and jeweled buckles; often were they so voluminous that only a box of generous dimension could hold them.

These bandboxes were diverted from their original use by our great-grandmothers who desired to utilize them to hold not only their headgear (not simple small bonnets, but calashes, muskmelon hoods, and poke bonnets, capacious enough to hide their fair faces) but smaller ones better to carry their muffs, wigs and caps which were in favor with the early nineteenth-century American belle.

Soon the boxes became so necessary that many different sizes and kinds were demanded, ranging from tiny ones, small enough to hold a cap, to those capable of holding party dresses, laces and camel's hair shawls. Time has dealt leniently with these old-time belongings, for we find them as rich in their bright coloring as when first made. The vegetable dyes of yesterday retain their colors far better than the anilined dyes used today. While we have steadily advanced in art, we have never been able to equal the rich tones of the colonial yellow, the soft shades of china pink, and the cool coloring worked into hemlocks, as depicted by our ancestors in olden days. These blend with the color notes necessary for interior decoration in present-day homes.

These forerunners of the modern hatbox reached the height of their popularity in the middle of the nineteenth century, fulfilling the mission of the traveling bag and modern wardrobe trunk. Protected from dust by cloth covering, finished with drawstrings, they could easily be carried on the pillion or stagecoach, arriving as fresh as when they started. Romances, sad and gay, are linked with their past history. Could they but speak, how eloquently would they relate stories, concerning bygone days and ways.

Into this art has woman intruded, for we come now and then across a quaint old-time wooden bandbox, labeled under the cover:

"BANDBOX MADE BY HANNAH DAVIS, EAST JAFFREY, N. H."

Such a one is still in existence owned by Lee Porter, of Boston, Massachusetts, an oval wooden box painted black, with yellow decorations. This type holds a special place in the old-time bandbox world.

Hannah Davis was enterprising. She purchased spruce logs, had them hauled to her door, then sawed and shaped them into proper lengths through use of a foot-power machine. Each one was oval in shape, sometimes covered with fancy wall paper, and again painted black with pattern drawn in. Their stability made them popular, especially for packing clothes to carry upon a long journey. Her prices were reasonable, rarely charging more than fifty dollars for the larger boxes and twelve and a half for smaller ones. These she delivered in person, within a limited area.

These boxes soon became very popular on account of both their convenience and reasonable prices. They came into style at a time when money was flowing more freely into our country, through the advance of commerce. This permitted better living and more elaborate dressing. In those days journeys were often made on horseback and necessitated lighter baggage as it was often fastened to the pommel of the saddle. Divested of their plain outer covering they were often artistic in decoration, especially when their soft faded exterior suggested the Japanese prints of that day.

Grandmother's bandboxes originated beyond question in France. For proof we come occasionally in a large collection upon one or more with "Carton-French" (for pasteboard) printed on it. They were copied in other countries, although the majority of those found today are of American make, illustrating events that took place during the late eighteenth and early nineteenth centuries.

The majority of them are (Continued on page 25)

Events formed themes for bandboxes. So when the Grand Canal was opened we find it shown on the old-time box for holding headgear.

# Why and How It Is "America"

## Because Vespucci, Not Columbus, Best Understood the Art of Publicity

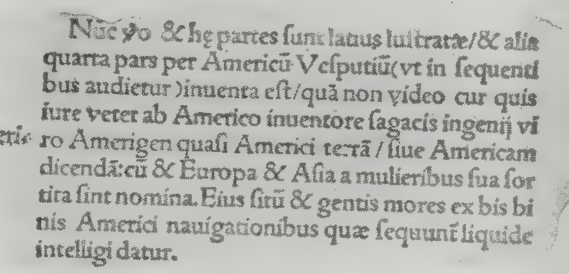
By LOUIS C. KARPINSKI

THE famous Spanish historian Gomara, in his History of the Indies, 1552, began the dedication to Emperor Charles the Fifth with this prophetic utterance: "The greatest event which has happened since the Creation of the world, aside from the incarnation and death of Him who created it, is the discovery of the Indies." Undoubtedly that remark was then regarded as a literary exaggeration. Evidently in disagreement was the Academy at Lyon, France, much later as it proposed about 1783, the prize topic, "Has the discovery of America been a benefit or an injury to the human race?" At the present time the world would agree that Gomara's statement was prophetic, fulfilled beyond dispute.

Full appreciation of the probable significance of the New World in future history was granted to two men who devoted themselves to making permanent records of the events of the discovery period, Peter Martyr and Ferdinand Columbus.

Peter Martyr, priest, ambassador and historian, began in 1493 to keep a systematic account of events in New Spain. The printed versions separated the events into decades and these "Decades" constitute the first history of the New World, among the most precious books on American history. A portion of the first Decade was published without Martyr's authorization in 1504; a separate volume appeared at Seville in 1511.

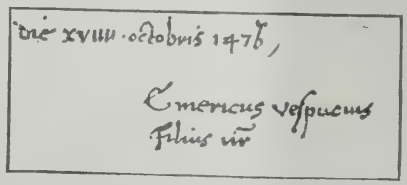
Ferdinand Columbus, son of the great Admiral, enjoyed the advantages of the best schools of his day. Ferdinand was devoted to the memory of his father and wrote an account of his life. This biography written in Spanish was first published in 1571 in Italian translation by Alphonse Ulloa. No trace of the Spanish original has ever been found. Ferdinand was interested, like his father and his Uncle Bartholomew, in maps as well as books, writing a work on the cosmography of Spain. Ferdinand Columbus was the first collector of Americana on record. The success of his father gave to Ferdinand the means to travel over Europe. On his journeys he collected rare books and particularly books which touched upon America. As Ferdinand was careful to note date and place of purchase with price these records give valuable information concerning book prices of long ago. In all, Ferdinand gathered a library of fifteen thousand volumes which he bequeathed to the Cathedral at Seville with provisions for placing the books at the service of students.



On the tomb of Ferdinand in this same old Cathedral at Seville a modest inscription was to be placed, devised by Ferdinand himself, stating: "Here lies Ferdinand Columbus, the son of Christopher Columbus, first Admiral, who discovered the Indies. He devoted himself to the cause of letters and of learning."

The provisions for the maintenance of the library at Seville were long honored only in the breach. Many of the volumes found their way to the book markets of London and Paris.

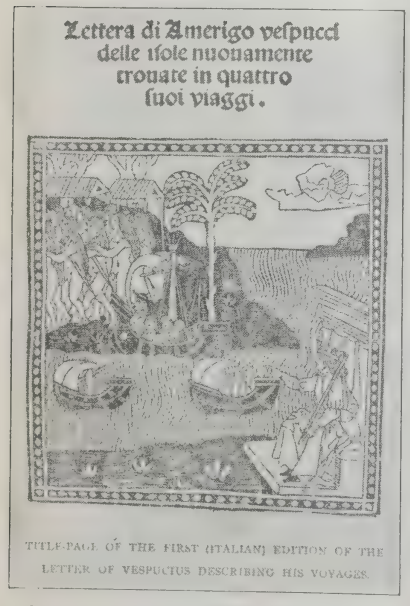
Today some of these valuable books with the detailed entries made by Ferdinand are found in other great libraries. The John Carter Brown Library possesses a book of 1507 with a note at the end in Spanish in the handwriting of Ferdinand Columbus: "This book cost 3 quatrines in Rome in June of 1515"; and a book of 1516 has a similar note. Fortunately the appreciation of the value of the Columbus library was awakened and today the library is protected and placed at the service of the public as Ferdinand intended. Among the most valued treasures of Ferdinand's library are a dozen books with marginal annotations made by the great Christopher Columbus himself. Ten American libraries have united to secure photographic reproductions of these works with the notes and in this form one may examine Christopher's handwriting in Cambridge, Providence, Ann Arbor, New York, Chicago, Washington and California.



In any collection of Americana first place is given naturally to the letters of Columbus printed during the years 1493 and 1494 and later, which announced the birth of the New World. Not over one hundred copies of the letters of Columbus in fifteenth-century edition are known, as the works were fairly "devoured" by eager readers. The known copies are distributed among a few American and several European libraries. Now Australia and Asia are also entering the market for such rarities.

The first book to contain the name America was printed in the village of St. Dié in Alsace in the year 1507. This little cosmography ranks close in importance to the letters mentioned. In the same year the Alsatian students made a globe and also a large map of the world, which was found recently in the castle library of Prince Waldburg Wolfegg of Würtemburg, Germany.

Nūc vo & hę partes ſunt latius luſtratæ/& alia quarta pars per Americū Veſputiū(vt in ſequenti bus audietur )inuenta eſt/quā non video cur quis iure veter ab Americo inuentore ſagacis ingenij vi ro Amerigen quaſi Americi terrā / ſiue Americam dicendā:cū & Europa & Aſia a mulieribus ſua ſor tita ſint nomina. Eius ſitū & gentis mores ex bis bi nis Americi nauigationibus quæ ſequunt liquide intelligi datur.



Ameri-
ca

The first appearance of the word America. This appears in the Cosmographiae Introductio published at St. Die in Alsace in 1507. The author, Martin Waldseemuller, states that it is called America after the discoverer, Amerigo Vespuccius, a serious error. The author adds that the feminine form America agrees with Europa and Asia.

die xviii octobris 1476

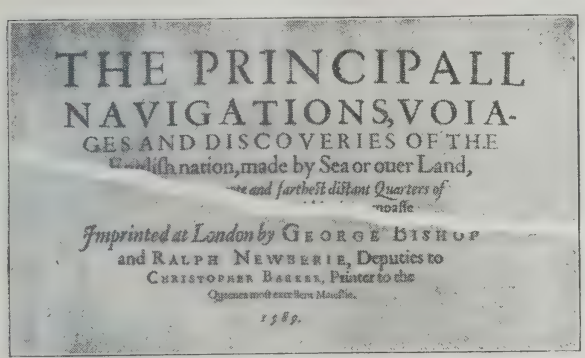
TITLE-PAGE OF THE FIRST (ITALIAN) EDITION OF THE LETTER OF VESPUCIUS DESCRIBING HIS VOYAGES.

The famous Vespucci letters, first edition, Italian, 1505. Vespucci made his accounts more interesting than those of Columbus and so these letters were more widely read and copied.

This is the first map with the name America upon it.

Among rare books the original records of great voyages of discovery command first place. The accounts of the voyages of Cartier and Champlain in the Great Lakes region, of Hudson and Frobisher, of Sir Walter Raleigh's adventures as described by the English mathematician, Thomas Hariot, touch regions where there is wealth and intelligent appreciation of the events of history.

The early history of the Great Lakes appears largely in the Jesuit Relations, small pamphlets recounting the struggles of the priests in carrying their messages to the Indian tribes of North America. These "Relations" are precious. Fairly complete sets are found in Quebec and in the William L. Clements Library at Ann Arbor.



The early collections of voyages enjoy high favor also in the eyes of book collectors, furnishing frequently the

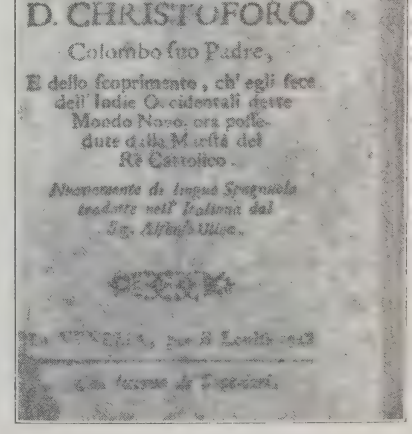
great libraries of England and America.

Thomas Hariot, a mathematician and scientist, went, in 1585, on the colonization expedition sent by Sir Walter Raleigh to Virginia. During the stay of more than one year he made observations of the plant and animal life of the region as well as observations of the inhabitants. In 1588 appeared at London Hariot's *A briefe and true report of the New found land of Virginia, of the commodities there founde and to be raysed as well marchantable, as others for victuall, building and other necessarie uses for those that are and shalbe the planters there, and of the nature and manners of the naturall inhabitants.* Prominent among the products were potatoes, later introduced into Ireland, and tobacco and corn, now highly important world products.

THE PRINCIPALL
NAVIGATIONS, VOIA-
GES AND DISCOVERIES OF THE
English nation, made by Sea or ouer Land,
... and farthest distant Quarters of
... earth
Imprinted at London by GEORGE BISHOP
and RALPH NEWBERIE, Deputies to
CHRISTOPHER BARKER, Printer to the
... Maiestie.
1589.

First collection of voyages in the English language. Extremely rare and valuable.

In 1590 a folio edition of Hariot's work in English with twenty-two plates and a map was issued by Theodore DeBry in Frankfort. These two works are found together in the Clements Library, and in the Huntington Library in California. Either one would make of any library possessing it a distinguished library. Theodore DeBry of Frankfort began with Hariot's work the publication of a series of finely illustrated volumes with accounts of voyages. Hariot's account was published in three versions in Latin, German, and in English. The DeBry volumes continued to appear until 1634, making the acquisition of any complete set a work requiring real patience. During this long period of production the popularity of the work, the copperplate illustrations being largely responsible, made it necessary to publish second and third editions of some of the volumes. The collector desires all the variations and each discovery of a change in size or form of even an initial letter is hailed as an event worthy of note.

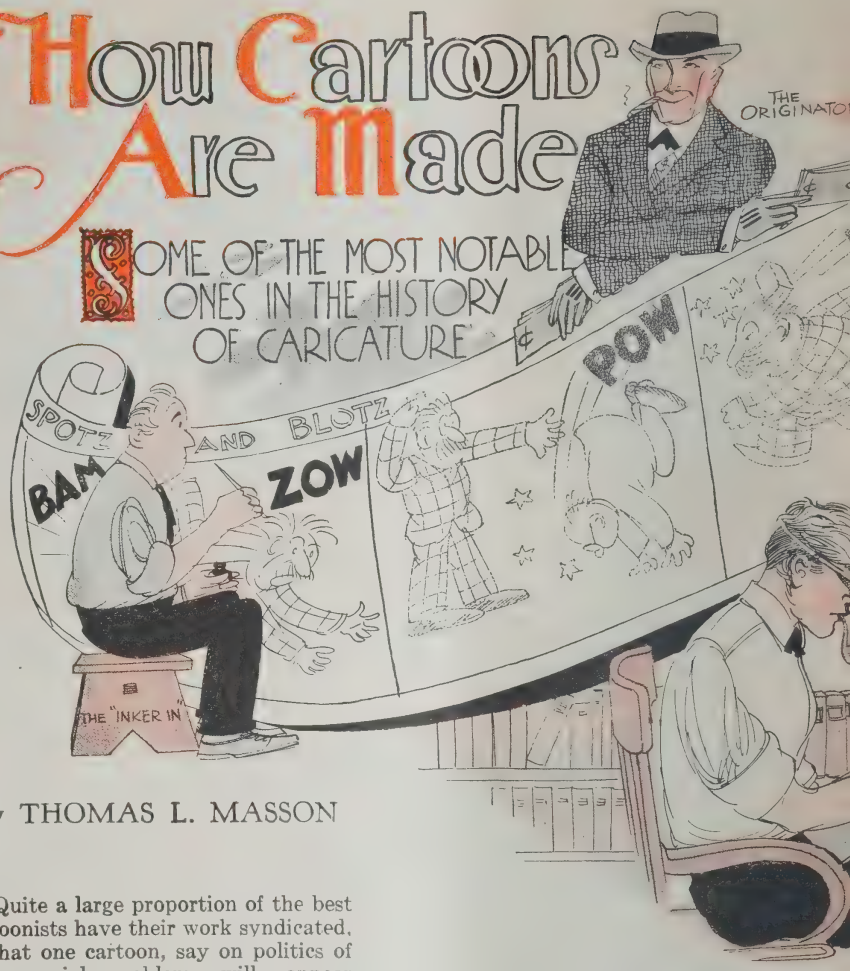


Printing began in the New World, not in Cambridge or New York as one is tempted to believe, but rather printing began in Mexico City in the year 1539. Mexican "imprints" of 1539 to 1600 are among the rarest of American treasures. Even those works printed in Mexico before 1800 are highly prized because of their rarity, due partly to the Mexican habit of revolution. Particularly the imprints which deal with the Indians or with any other subject than religion are desired; however, the religious works predominate, as they do in early New England and Pennsylvania. The material in all cases has little attractiveness today and was never really exciting literature.

Printing in the English Colonies began one hundred years after its appearance in Mexico and long after printing had appeared in Peru. In 1639 Stephen Daye set up a press in Cambridge, Massachusetts. The first product of this press was an almanac which type of literature continued in popularity from that day down to the present. Following the almanac a single leaf bearing the Oath for Freemen was printed, also in 1639. The next year there appeared the first English book, "The Bay Psalm Book," now counted

(Concluded on page 28)

earliest accounts of voyages of great importance. Of Cartier's first voyage to America in 1534, the Italian Ramusio included in 1556 an account which is the earliest known. Ramusio voyages appeared in three folio volumes of about 1,000 pages each; the work was so popular that other numerous editions of the separate volumes appeared from 1550 to 1613.



In 1582, Richard Hakluyt published "Divers Voyages Touching the Discouerie of America," to stimulate colonization. In 1589, the same author brought out a much larger collection of voyages which was well received. This work was issued in three parts, 1598-1600, entitled: "The Principal Navigationes Voiages, Traffiques, and Discoueries of the English Nation . . ." In the third volume Hakluyt gives in English Ramusio's account of Cartier's first voyage and a fragment of the account of Cartier's third voyage of 1540 which is unfortunately the only early printed record of that important voyage. Hakluyt's work is naturally sought by the

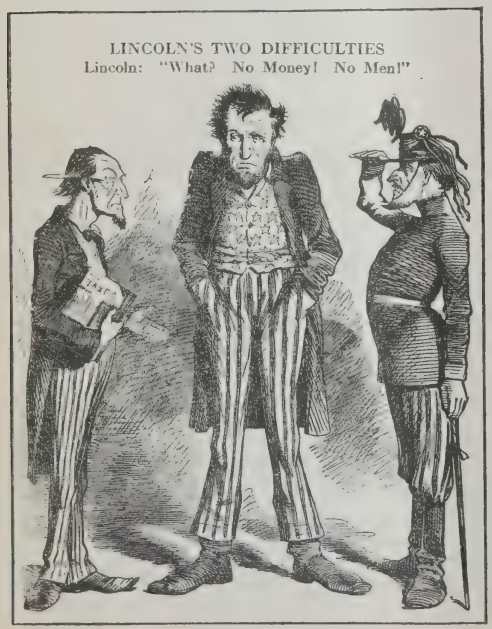
# How Cartoons Are Made

## Some of the Most Notable Ones in the History of Caricature

By THOMAS L. MASSON



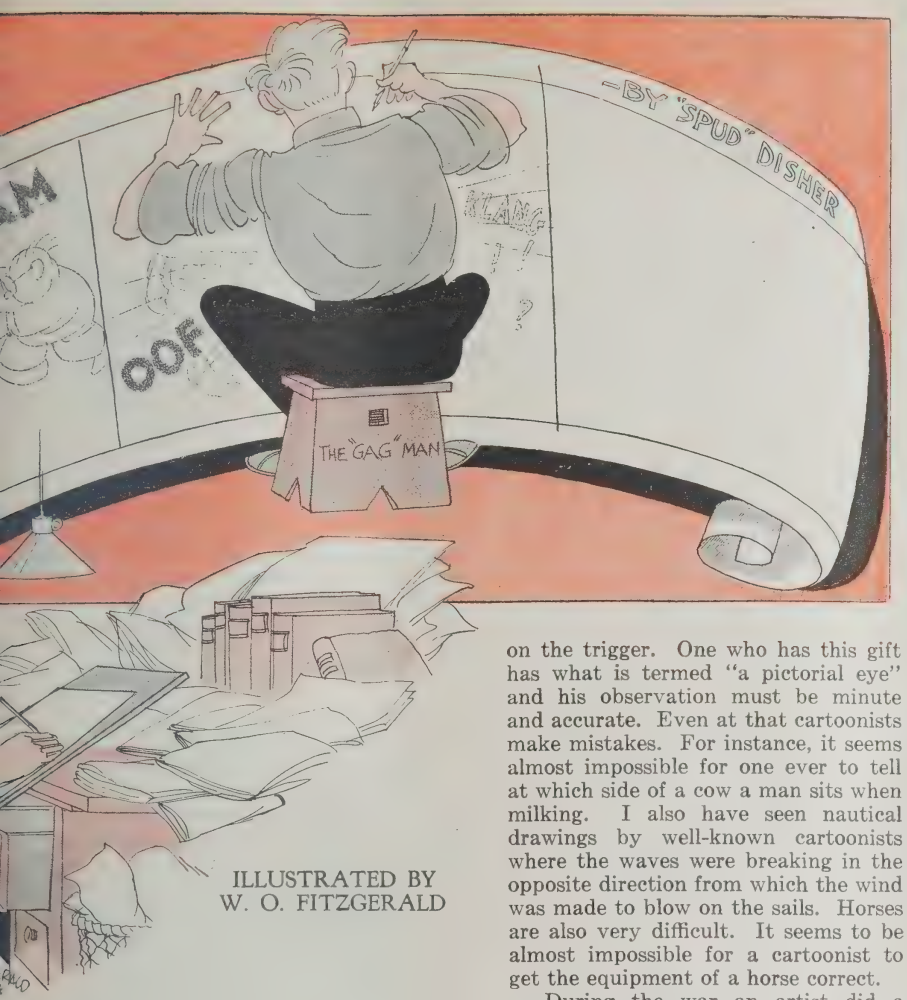
RECENTLY I sat in the studio of one of the greatest cartoonists in this country, a man who refuses to attach himself to any paper, preferring, as he says, to be guided by his own star.

He complained because his boy had just bought a three-dollar necktie, which he thought was grossly extravagant. He was probably right.

"I have had a lot of offers," he said. "One the other day of $300 a week, just for a part of what I do, but upon my word I'd rather wear a fifty-cent tie than do something which doesn't appeal to me. I guess the boy feels otherwise."

This doesn't mean for a moment that all attached cartoonists are slaves. On the contrary, a large part of the success of a cartoonist consists in his agreement and sympathy with the editorial policy of the paper for which he works. The public is quick to detect any note of insincerity. Besides, an artist cannot do a good cartoon unless he feels it.

One of the best cartoonists we have, employed by one of the largest daily papers, told me the thing which is hardest to bear is the indifference with which his work is treated by the management. He finished his preliminary sketches (usually rough outlines in pencil), they were approved without comment, published every morning, and that was the last he heard of them so far as the paper itself was concerned. The only "kick" he got out of them would be an occasional letter or message from some friend. This leveling of an artistic talent to a business routine is due to the pressure brought to bear upon the members of an editorial staff, which cannot waste its enthusiasm on superfluous surfaces.



How John Tenniel used Lincoln as a character in a cartoon (*Punch*, 1862).

Quite a large proportion of the best cartoonists have their work syndicated, so that one cartoon, say on politics of some social problem, will appear simultaneously all over the country. This can be done only when there is time; that is to say, when the idea depicted will keep until it can be used.

This handicap has resulted in what may be termed a generalization of ideas, and has divided the work of cartoonists into the local and immediate, as differentiated from the more abstract and general. A local cartoonist will submit his idea to the editor or staff in the morning, or it will be suggested to him through conference. He will make his drawing, and this will be published the next morning, possibly with editorial comment. The same cartoonist, if he is in the first class, may also make a weekly cartoon, one which will keep, say, a month, and this will be sent out through the syndicate department.

The incomes derived by the best cartoonists are not nearly so large as the incomes of the best comic strip men, who may earn all the way from $30,000 to $150,000 a year. Many cartoonists on small papers get a weekly salary, rarely more than $50 or $75 a week. The rate paid for a single cartoon depends, of course, upon the reputation and ability of the artist and the periodical or paper. Some of the weeklies pay as high as $100 for a single drawing. Most cartoonists are attached to some paper, a free lance being the rare exception. As to the respective ability of the comic strip artist and the cartoonist, it is rather difficult to make any comparison. The work of the cartoonist seems to require a higher order of brains. If he is on a daily paper, he must furnish a new idea every day. His drawing must be so simple that its meaning is understood at a glance. He must be a student of affairs, and know the history of his country, at least in outline, and must naturally feel his citizenship.

On the other hand, the comic strip man after he has first evolved his characters (such as the Foxy Grandpa of Carl Schultze or the Mutt and Jeff of Bud Fisher) must do nothing else but ring the changes on them every day. In some cases the comic strip men, who have originated characters which have become familiar to the public, not only actually employ other men to furnish ideas, but even other artists to imitate their style and do the drawing, so that all they themselves do

ILLUSTRATED BY
W. O. FITZGERALD

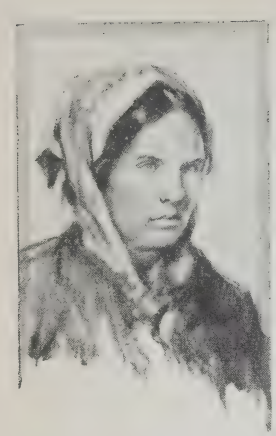
is to draw their pay and take out a small part of it for those who are doing the work. This shows the enormous power of a single idea, which thus continues to support its creator indefinitely.

So far as the cartoonists and their work are concerned, however, I regret to say it is too often true that they know too little about the history of this or any other country, and even their knowledge of current affairs is superficial. There is probably no talent which displays itself as a gift like drawing. A man either has or hasn't it. Men who have it find their work in demand, and so swiftly do things move, that they have no time to acquire a sufficient background. The result is that a too large proportion of cartoons we see are not based upon deep-seated knowledge, or that kind of meditation which is necessary to produce masterpieces. Of course, as I have stated, a cartoonist is handicapped a great deal by the speed with which his work must be finished, and also by the fact that the genius for getting a complete situation on paper in the fewest lines is such a special thing in itself that it is not always accompanied by the capacity for study or research.

A popular cartoonist must be quick on the trigger. One who has this gift has what is termed "a pictorial eye" and his observation must be minute and accurate. Even at that cartoonists make mistakes. For instance, it seems almost impossible for one ever to tell at which side of a cow a man sits when milking. I also have seen nautical drawings by well-known cartoonists where the waves were breaking in the opposite direction from which the wind was made to blow on the sails. Horses are also very difficult. It seems to be almost impossible for a cartoonist to get the equipment of a horse correct.

During the war an artist did a cartoon for me of the marines and got the uniforms wrong. A howl went up from headquarters, not only here but in France. Later, another artist (Paul Stahr) did a cartoon of the Red Cross and Motor Corps women in color. We were both determined to get the picture right, so Mr. Stahr actually got together all the women in their uniforms and, grouping them, painted them from life. This picture now hangs in my library and a hundred years from now could be used as an accurate presentment of the uniforms our women wore during the war. Mr. Stahr will remember that he was paid $25 extra for this additional trouble to get the detail right. It was worth a good deal more than this.

Admitting that the artist has the proper skill and facility in drawing, the great difficulty in getting up a daily or even weekly cartoon is, first, the idea, and second, the setting. In most cases the subject is decided upon either by the editor or the editorial staff in conference. Then the artist may make a pencil sketch for further consideration; or, on his own account, may submit several preliminary ideas in the rough and a selection from these is made by the editor, the whole process taking but a few minutes. The most difficult part of the work is the caption or text underneath. Oftentimes this is suggested by the situation in the picture as, for example, in *Punch's* historic cartoon by Tenniel, of Bismarck, the caption "Dropping the Pilot" was obviously the only one.



For purposes of pictorial representation in cartoons I have always kept on hand a set of the world's most famous picture reproductions, as they often serve as a basis to carry ideas. Fairy stories also, because they are so familiar to everyone, are a prolific source from which to draw. I would not dare say how many times *Beauty and the Beast*, *Cinderella*, and *Jack the Giant Killer* have thus been used as a basis for cartoons. These subjects, however, are rapidly exhausted, so that our modern cartoonists are forced to use modern objects—motor cars, flappers, gun men, radio sets, and a host of other things which have become part and parcel of our horizon and environment. When public men are used as the characters in cartoons they are pictured in all sorts of ways. Thus Kepler made Blaine as a tattooed man and Davenport made Mark Hanna with a suit covered with dollar marks.

In this country the custom of caricaturing prominent men is not so widespread as it was; that is to say, as cartoon subjects. But the art of caricature has made great advances. In England, *Punch* continues its traditional policy of cartooning public men, Raven Hill and Bernard Partridge keeping well up to the high standards of that best of comic weeklies.

It is only in recent (Continued on page 29)

Roosevelt was a popular subject with the cartoonists. This one by Sear appeared in the New York *Globe*.

# Lack of English May Mean Death

## Foreigners' Ignorance of Language Is the Cause of the Killing and Maiming of Many Industrial Workers in America Each Year

By MARIAN K. CLARK

DESPITE the fact that literally hundreds of millions of dollars have been spent in so-called "welfare work" in the past ten years, it is generally conceded that the non-English speaker in industry remains the greatest unsolved problem, the greatest accident hazard, and the greatest turnover liability with which the basic industries of this country have been and are now confronted.

Two factors of vital importance have been consistently overlooked by the average industrial management: first, the human problem—the *volker psychologie* of the Germans; and second, the language problem—the industrial dialect of the industry.

When the immigrant arrives in this country he is alien to our language; our customs. At once he is snatched up by a labor agent, perchance with an order for "forty Spaniards." He is hurried to a train; to a distant town; to a huge and high-power industry. He cannot understand the orders of his boss and his training in obedience goes for nothing when he fails to comprehend commands. He is "fired." Lacking any means of mutual communication employer and employe remain each to the other an unsolved mystery and from this misunderstanding follows the maladjustments that lead to industrial accidents, discontent, restlessness, dissatisfaction, segregation and finally turnover.

In one of the foremost industries of the country where turnover was excessive the costly "welfare work" consisted of milk pasteurization, tennis courts, ball grounds, hospitals, modern housing, et cetera, but the single men were sleeping in double shifts in vermin-infested bunks; while in the carbon rooms an out-of-order exhaust system blew dust into the eyes and lungs of the workers, blackened the atmosphere and piled in drifts upon the floor. It is needless to say that tennis courts cannot be considered an alleviation for the conditions described above. Elaborate systems of welfare management through overorganization often lose their human touch and become mechanical, many of them could very well be modified and simplified, for often their very complexity renders them cumbersome and inflexible and acts as a barrier between managers and those whom they desire to reach.

Until the United States Bureau of Labor Statistics began its inquiry into the accident hazard of non-English speakers in 1917 no systematized analysis had been attempted by a governmental agency to establish the relativity of the alien as an economic factor in industry. The result of that inquiry very definitely established the status of the foreigner as a high accident hazard and a high turnover factor in basic industries. In the same year the State Industrial Commission of New York, through its Bureau of Industries and Immigration, conducted an investigation, based upon the British system, and computed upon the testimony of four thousand non-English-speaking applicants for compensation, with the result that a definite relationship was established between alien illiteracy and industrial accidents. The results of both of these studies have proved conclusively that the ratio of high accident rates to non-English speakers is constant regardless of safety activities and high welfare expenditures.

In the minutes of the hearings before the Congressional Committee which investigated the causes leading up to the great steel strike, an official of one of the largest steel corporations dismisses the subject of the non-English speaker with the remark that "there is no way of getting hold of the foreigner." It is true, there is "no way of getting hold of the foreigner" in a furnace in Pittsburgh from a skyscraper office in New York!

Owing to our public school system the American workman is unit for unit the most efficient workman in the world today and industrial Americanization must begin with a common language for a basis, for whether it be to transform a foreign workman into an American workman or a common laborer into a skilled mechanic, we must bestow upon him first the language of the country.

The non-English speaker does not require scholastic instruction in this connection, nor is it the function of the employer to provide education for him, as such. Education of the alien, once fully admitted to the country, is the obligation of the state and the community of which he is a component part; but, introduction into industry of a system of Industrial English is to be regarded not as an *educational but as a commercial activity.*

It is an amazing fact that the Department of Economics in each and every university in the United States has overlooked this most important phase of not only industrial but political economy. Since the solution of this stupendous problem depends upon methods of instruction it is the patriotic duty of every university in the land to study these statistics, to organize extension courses, to compile vocabularies, to construct dialects and to wipe out the non-English speaker whether such courses are endowed or not.

One language in industry would make for stability, which lessens the excessive cost of turnover. It would increase efficiency and decrease the waste of the green hand. It is estimated that the cost of turnover in industries where non-English speakers are employed runs from 15 to 1,000 per cent, and an exceedingly conservative estimate of the cost of such replacement runs from fifty to five hundred dollars and upward a man. "Hiring and firing" constitutes the most excessive loss in modern industry and this, when added to the cost of accidents among non-English speakers, confronts the industrial world with a staggering loss for which no reasonable remedy has as yet been adopted.

In the 72,000 factories of New York State more than 2,000,000 workers are employed of whom more than 1,500,000 are foreign born. Of these, *400,000 cannot read or write in their own language and 700,000 cannot understand or speak English.* This is a condition that makes individual development impossible and is a barrier to industrial progress and a menace to industrial safety.

During the past decade industrial accidents in New York State have

averaged 1,000 a day. In compiling industrial accident statistics it has been shown that after the seventh year of operation in Compensation Law the peak has been reached, but in New York, with its excessively large population of non-English speakers, there has been a complete reversal of this experience and the ratio of 1,000 accidents a day, once reached, *has remained constant.* These 1,000 accidents a working day, resulting in either total or partial disability, mean casualties of 350,000 a year of which 14 per cent are fatal, and which cost as an initial expenditure, $20,000,000 per annum. To this sum must be added the cost of medical benefits, administration of the Compensation Law, wages and cost of turnover, all of which has increased the total cost of accidents, direct and indirect in that state, to approximately $35,000,000 yearly or at the rate of $117,000,000 a day for each working day in the year, and 70 per cent of these applicants, in the New York Office, present their claims through an interpreter.

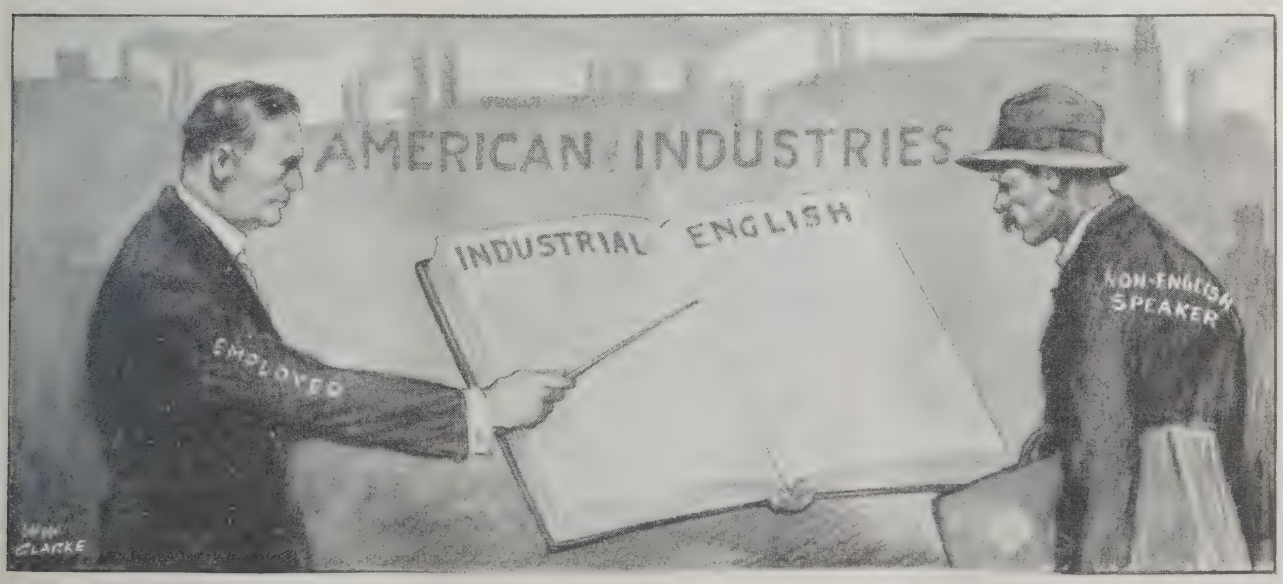
This is an appalling record. It means that every year one industrial worker in every five in the State of New York is so seriously injured while at work that he is at least temporarily incapacitated. These figures appear most unfavorable when contrasted with corresponding statistics of other countries having no language problem.

In Great Britain in 1921, there were 7,315,866 industrial workers and only 283,361 accidents of which only 2,385 or four-fifths of one per cent were fatal; as against 2,000,000 workers in New York State having 350,000 accidents of which 14 per cent were fatal. This contrast is to be deplored not only on the ground of humanity but on the grounds of pecuniary and productive loss.

The fact that 70 per cent of the applications for compensation in New York City are presented through interpreters is concrete evidence that the non-English speaker is a huge drain upon industry, and, if this loss, as all investigations tend to prove, *is primarily caused by ignorance of our language,* its elimination should engage the undivided attention of the industrial management of our time. *"English for Safety"* should be adopted as an industrial slogan in all industries where non-English speakers are employed and results noted.

Ignorance of the English language, with consequent inability to read traffic signs, has been disclosed as a cause of traffic accidents which are so disastrously on the increase and the "Conference on Street and Highway Safety" has instituted an investigation to ascertain to what extent illiteracy may be considered as a factor in traffic accidents. The Delaware Safety Council has taken steps to ascertain facts about the type of driver who is the most frequent violator of traffic rules and the reasons therefor.

Connecticut is also taking into account the question of illiteracy as a factor in motor car accidents and had started a movement to teach enough English to foreign-born drivers to enable them to distinguish between "Go" and "Stop" signs and to recognize road signals. When it is considered that not only the lives of the drivers are at stake but lives of the public as well, it would appear that the time to insist upon such instruction would be before a license to drive is issued and not afterward.



Some 14,000,000 persons in the United States are of foreign birth, nearly half of these cannot read nor write the English language and some 2,000,000 are illiterate even in their native tongue. They have been in general neglected, unappreciated, forced to segregate and denied, through ignorance of our language, the opportunities for contact with that which is best in American life.

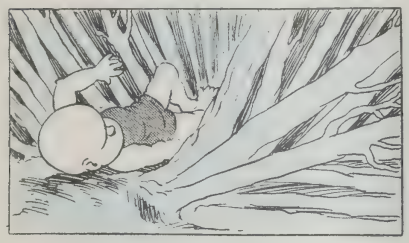
*Their value to the country, to their families, and to themselves could be enormously increased by a compulsory amendment to the immigration law providing for the mandatory acquisition of an English dialect within a definite specified time after admission to the country.*

*No European nation has ever at any time tolerated the use of a foreign language by colonists after a specified length of residence, and no European nation has ever had even an approach to an immigration problem such as ours for consideration.*

Although these facts have been presented in the form of reports by government agencies, industrial and insurance statistics, safety conferences and private reports since 1917, the carnage still goes on and the absentee system of industrial management has completely supplanted the absentee system of landlordism from which the unfortunate alien had precipitately fled.

Upon the language of a nation depends the development of a nation, its literature, its type and its traditions. If a nation is to remain dominant the language of that nation must predominate. It cannot be tolerated at this particular epoch of American history that any foreign influence, either of race or language, shall gain the ascendency over either our characteristics or our institutions. If our national language is to remain the English language, then let there be compulsory requirements for every immigrant to learn an industrial dialect within a given stipulated period after his admission to the country, and one of the most valuable contributions to posterity that can be bestowed upon this nation will be the elimination by industry of the non-English speaker as an industrial entity in the United States.

"Introduction of a system of Industrial English is to be regarded not as an educational but as a commercial activity."



# Who is Paul Bunyan?

## —Great American Myth

By THEODORE M. KNAPPEN

CRITICS agree that staggering exaggeration is the mainstay of the American type of humor. If they are right, Paul Bunyan is not only the greatest and perhaps the only indigenous American myth, but he is also the magnificent personification of American humor. Well known among all who are associated with the huge forest industries of America, Paul has but recently attracted the attention of the

"Rolled so much he destroyed four square miles of timber."

literati. College professors are turning their inquiring spectacles toward his achievements, rejoicing in having a myth in captivity for their seminars and other literary clinics. "Colyumnists" are giving him free publicity, short-story writers are sending forth their own accounts of his adventures, the National Lumber Manufacturers Association plans a Paul Bunyan anthology for the eternal renown of its legendary hero, and a well-known publisher now announces the early appearance of a collection of his fabled exploits.

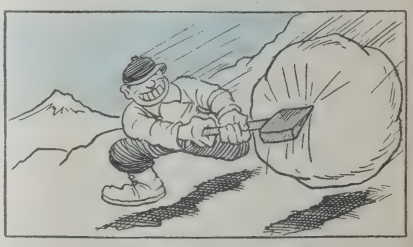
And yet many a well-informed person will ask, Who is Paul Bunyan?

Paul is the giant of the lumber jacks; a myth in installments; a living personage whom no one has ever seen, but to whose mythical biography a thousand imperturbable jesters of the lumber camps are still making their contributions.

It is passing strange that out of lumbering, and not out of war or religion, the Great American Myth has come.

In the run of a camp conversation about logging operations a tough and gnarled veteran of the woods will be moved to relate some deed of Paul Bunyan's performed "on the Big Onion, the winter of the Blue Snow" and another will respond with an account of a mighty achievement "at Shot Gunderson's camp on the Tadpole, the year of the Sourdough Drive." They toss the myth back and forth. Each fabricates a stupefying lie—majestic in its impossibility, grotesque in its contradictions. The unwritten law of these sublime contests in unrestrained fiction is that neither auditor nor veteran hearer shall ever evince mirth or wonder. These unworthy emotions are left for the greenhorns of the camp, but when an old hand surrenders to sniggers, it is the supreme testimonial accorded the anecdotal genius of the story-teller.

Some contend that Paul Bunyan was born in Maine, date of birth unknown; others say that the French-Canadian woodsmen found him and carried him with them to all the lumber camps of the Northern States from Maine to Washington; while there are still others who contend that he was miraculously born in the pineries of the Lake States. Judged by the extensive locale and the various periods of the exploits attributed to him he attained his prime between 1880 and 1900 when lumbermen were mowing the white pine forests of Michigan, Minnesota, and Wisconsin at a rate that rivaled Paul's unlimited resources



The version that honors Maine with Paul's birthplace says that no trustworthy account of his parentage or ancestry is extant. "When three weeks old," however, "he rolled around so much in his sleep that he destroyed four square miles of standing timber. Then they built a floating cradle for him and anchored it off Eastport. When Paul rocked in his cradle it caused a seventy-five-foot tide in the Bay of

"Saved nine barrels of ink one winter by leaving crosses off his t's and dots off his i's."

Fundy and several villages were washed away. He couldn't be awakened, however, until the British Navy was called out and fired broadsides for seven hours. When Paul stepped out of his cradle he sank seven warships and the British Government seized his cradle and used the timber to build seven more. That saved Nova Scotia from becoming an island, but the tides in the Bay of Fundy haven't subsided yet."

Paul grew up to be the mightiest of

"Paul's axmen had to sharpen their axes by rolling rocks down hill."

woodsmen, commanding the aid of certain powerful human and animal associates. Among these were or are Babe, the big blue ox; Benny, the little blue ox; Big Joe, the camp cook; Lucy, the cow; Elmer, the moose terrier; Sport, the reversible dog; Fido, the watchdog; Johnny Inkslinger, the headquarters clerk and bookkeeper, inventor of bookkeeping and master of economy (he saved nine barrels of ink one winter by leaving the crosses off his t's and the dots off his i's); Big Ole, the blacksmith at Paul's headquarters camp on the Big Onion; the Seven Axmen of the Red River; and The Little Chore Boy.

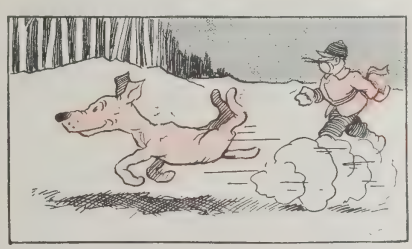
"When Paul invented logging," says the booklet, *Paul Bunyan and His Big Blue Ox*, published by the Red River Lumber Company of Minnesota and California, "he had to invent all the tools and figure out all his own methods. There were no precedents. At the start his outfit consisted simply of Babe and his big axe.

"No two logging jobs can be handled exactly the same way," we read, "so Paul adapted his operations to local conditions. In the mountains he used Babe to pull the kinks out of crooked logging roads (one very crooked road two hundred miles in length in Maine being quickly straightened in that way); on the Big Onion he began the system of hauling a section of land at a time to the landings, and in North Dakota he used the Seven Axmen the winter he logged off that state."

Some people doubt this latter achievement, but there are old-timers who were eyewitnesses, and besides there are no forests in North Dakota now—so there you have the confirmation of the tale! Moreover, Paul is credited with having saved North Dakota settlers not less than $563,000,-

"The men had to wait until Paul came to pick up the horses."

000 by clearing the land. If he had done as complete a job in Minnesota, say the wise ones, the northern part of that state would not still be a wilderness of impenetrable forests, small growth and brush, and sparsely settled. The incompleteness of the Minnesota job is attributed to the fact that Paul had not yet profited by the fruits of his inventive genius. For instance, it was not until the winter he logged off North Dakota that he invented the grindstone. Before that Paul's axmen had to sharpen their axes by rolling rocks downhill and holding the ax against the rolling rocks as they raced along beside them. In the Dakota hills rocks were scarce, and on the plains hills were few, and so necessity mothered the stationary revolving stone.



"This was much appreciated by the Seven Axmen, as it enabled them to grind an ax in a week, but the grindstone was not much of a hit with the Little Chore Boy whose job it was to turn it. The first stone was so big that working at full speed, every time it turned around once it was payday."

It was probably during the North Dakota operation that Paul invented the method of making a draft-team turn itself around. Before that when a sled returned from the landing and put on a load of logs the men had to wait until Paul came along to pick up the horses or oxen and the load and point them in the right direction. All of Paul's engineering inventions and efficiency methods were successful except his plan to run the camp in three ten-hour shifts a day and install the aurora borealis for night work. After a number of trials this plan was abandoned because the lights were not dependable.

Babe, the admirable Blue Ox, was an indispensable factor in Paul's great works. North Dakota would never have been logged off in one season if Babe had not been there to haul a section (a square mile) of timberland at a time to the landing and then haul the land back after the trees had been stripped from it. At six trips a day, six days in the week, a township of land was cleaned up every week. "Section 37 was never hauled back to the woods, but was left on the landing to wash away in the early spring when the log drive went out." A glance at any map of North Dakota will demonstrate the truth of this statement regarding Section 37, for not a township in the state has more than thirty-six sections.

"Babe was seven axhandles wide between the eyes," according to some authorities, says the Red River booklet; "others equally dependable put this distance at 42 axhandles and a plug of tobacco. Like other historical contradictions, this discrepancy comes from using different standards. Seven of Paul's axhandles were equal to a little more than 42 of the ordinary kind."

When Johnny Inkslinger figured cost sheets on Babe he found that upkeep and overhead were rather heavy, but the charges for operation and depreciation were low, and the efficiency was very high. Babe could not be kept at one camp for more than a single night, for he would eat in one day all the feed one crew could tote to a camp in a year. Between regular meals he would eat fifty bales of hay, wire and all; and six men were kept busy with picaroons picking the wire out of his teeth.

"Nothing can be said about the reversible dog."

Babe was a great pet and very docile, but he seemed to have a sense of humor. He liked to sneak up behind a drive of logs going down a river and drink out all the water, leaving the logs stranded. It was impossible to build a sling big enough to hoist Babe off the ground for shoeing, "but after they logged off North Dakota there was room for Babe to lie down for this operation."

Babe's water capacity came in handy the year Chris Crosshaul took a big drive down the Mississippi to New Orleans for Paul. Chris was a careless cuss, and when he came to deliver the logs, acceptance was refused because the marks showed they weren't Paul's. It was up to Paul to drive them back to Minnesota against the current. He simply fed Babe a good big salt ration and drove him to Lake Itasca to drink. The river was reversed and the logs went upstream faster then they came down.

Babe was a diligent worker but the wanderlust got him occasionally. At such times he would run away and roam through the Northwest with sad effects on its topography. His tracks were so deep that a man falling into one could only be hauled out with difficulty and a long rope. At the same time the tracks were so far apart that it was impossible to follow their trail. Babe's cavorting tracks made the ten thousand lakes of Minnesota.

Benny, Babe's sometime yoke-partner, was a gift to Paul Bunyan from a farmer near Bangor, Maine. Although Benny was inferior to Babe as an animate tractor, he could eat more. His digestive capacity was what caused the farmer to give Benny away, as he had only forty acres of hay and Benny had cleaned that up by the time he was a week old. At that he was undernourished, and weighed only "two ton" when Paul got him. Paul drove the Little Blue Ox from Bangor to his camp near Devil's Lake, North Dakota, in one night. Benny was a very notional beast and wouldn't pull a load unless there was snow on the road. That made it necessary to practice deception on him by whitewashing the dirt logging roads in the spring. Although Paul kept 200 men busy cooking flapjacks for Benny he was always hungry. In his hunger one night he went into such convulsions that he stirred up a wind that blew down what pine Paul had left standing in North Dakota. At breakfast time he tore loose from his moorings, stormed the cook shanty and began bolting pancakes. He swallowed the red hot stove along with the cakes and a fatal attack of indigestion resulted. The Black Hills are his grave mound.

Brimstone Bill was the ox-skinner who handled the two oxen. He was an unsung efficiency engineer and a great help to Paul. It was he who devised the idea of a buckskin harness for wet weather. Thus equipped Babe and Benny would pull the traces until they stretched from the load to the landing, where they were tied to a tree. As the leather shrunk it pulled the load up to the landing. In the meantime, Bill and his oxen were doing other work, such as hauling white snow from China. That was the winter of the Blue Snow on the Big Onion which was not suitable to logging roads. Fortunately, the Pacific Ocean froze over.

Great as he was, Paul Bunyan had some failures and disappointments,

"Deception by whitewashing the dirt logging roads in the spring."

usually due to "the mistakes of some swivel-headed straw-boss or incompetent foreman." In the long-remembered winter of the Blue Snow, Shot Gunderson, who represented Paul on the Big Tadpole, boomed his logs in a landlocked lake, (Concluded on page 32)

# The Parasite Hunters

(*Continued from page 6*)

generations of parasites in America. When these parasites grew sufficiently numerous they would check the pest, would bring Nature back to a balance. That was the end which the scientists had in view.

The hunters in China had a similar problem in hand but it had to do with the activities of a different insect. They were trying to counteract the ravages of the San José scale which got started in America some decades ago and spread to most of the orchards of the nation. It was scale medicine they were after but not medicine that would improve the health of those marauders.

The appearance of the San Jose scale, arch enemy of the orchard, started a world search for its parasites. The first task, no mean one in sleuthing, was to locate its native home. It was traced to Hawaii, to Australia, to Japan, but in each case found not to have been native there. It had been brought to those countries from somewhere else. Finally it was found along the Great Wall in Northern China, into which region there had never been any introductions from the outside, living on wild haw apples. This was its native home.

Here, also, was found a certain ladybird beetle that fed upon it and held it in check. Shipments of these were made to Washington but, what with the long journey and the strange climate, but two of them lived through the winter. One of these bore young. From her were raised many generations of ladybirds that were established in orchards from coast to coast. The war between the scale and the ladybirds was on and would have been fought to a finish, had not another method intervened. The lime-sulphur sprays came into use and, since the fruit grower could get immediate relief from them, he turned to them instead of waiting for the slower development of the parasites. Unfortunately the sprays kill the lady birds as well as the scale.

Habrobracon eggs on larvae of the European corn borer. Years have been spent to introduce a parasite that would lay eggs on the corn-borer larva, afterward to hatch out and devour it.

Here is another clear-cut example of the sort of thing that takes place in the shifting of insects from place to place. The sugar-cane leafhopper appeared in the Hawaiian Islands and, a few seasons later, was costing the planters $3,000,000 a year. One plantation, for example, had been making 10,000 tons of sugar a year and ran down to 800 tons. The United States, having taken Hawaii under her wing, sent her experts to study the problem. They soon discovered that this leafhopper had come from Australia. They hurried to that country, found out what were its natural parasites, collected quantities of them, hurried them to Hawaii and released them. One of these was a tiny creature which laid its eggs in those of the leafhopper. There the parasite hatched out and devoured the young leafhopper. Another leafhopper destroyer was a strapping beetle which went about the sugar cane and devoured great quantities of them. In a year, after these were introduced, they were so plentiful that the plantation cited above produced 11,000 tons of sugar. The sugar-cane leafhoppers have not worried Hawaii since.

Yet all of this is not so simple as it seems. It may require much time to find out what is the effective parasite of an insect. Maybe there are two or three that attack it at different stages of its development. If the destroyer is a moth, for instance, there may be a parasite that does good work by attacking it in the egg stage. Yet another may attack it in the caterpillar stage and another in the moth stage. It may be necessary to introduce all three.

Bringing a living insect from Australia to California, for example, may be a very complicated thing. It has, on occasion, been necessary to stop off at New Zealand and allow a new generation to be bred. Then a run might be made with these youngsters and Hawaii might be reached before, having lived for ten days, they died of old age. There a new generation might be bred and a run made for San Francisco, again in competition with the grim reaper.

There are infinitely delicate problems in handling this sort of livestock. One might be introducing, for instance, a parasite as big as a gnat. It, in turn, might have its own parasites, as big as a pin point. The task is to introduce the parasite you want, without bringing in the secondary parasite that would keep it from flourishing.

Adult Japanese beetles doing business with an apple.

Then there is the task of causing the immigrant to flourish in the new home. It may get along well and it may not. It is hard to know what is happening. Many parasites have been brought to America that have seemed to die out. Strangely they sometimes come to light after decades have passed, thus showing that they have been present all the time in small numbers, have not been noticed, but in the end have established themselves.

There is the case of a parasite of the Hessian fly, dreaded enemy of the wheat crop, for instance, that was brought to America in 1894 and released at Fredericksburg, Maryland. It did not seem to get hold and no specimens of it were found for many years. Twenty-three years later, however, it turned up and now it is abundant through Maryland, Pennsylvania and New Jersey and is performing yeoman service for the wheat growers and will probably spread and continue to do so to the end of time.

It is also true that parasites are not always the answer. In the case of the boll weevil, for instance, searches for effective parasites have been in vain. Certain insects that were already in the United States have attacked them and reduced their effectiveness as much as 10 per cent but have failed to destroy them. The search for an effective parasite never ceases, however, and may be found. Even now one that has been brought in may be slowly increasing in numbers and some day may turn the tide against this great plague.

This parasite hunting is one of the most peculiar tasks to which the government sets its hand. There is the emergency, for instance, presented by the recent invasion of the Japanese beetle, which, as a grub, lives on grass roots and as a grown beetle takes to the fruit trees. It is the most dangerous present pest. The government has had one

man in Japan and Korea for five years, doing nothing but hunting for parasites for this beetle. The trail grew hot and another veteran hunter was sent to help him. Then China was added to the possible sources of relief and two more men were dispatched to the Orient. India became of interest and others were sent out there. Russia became a prospect and difficulties of language being great, a scientist of that nationality was added to the staff of the American insect hunters. Yet this world search is not very far along.

There are more modest enterprises under way all the time. One does not hear much about the Mexican bean beetle, for instance, but it is a weevil that comes up from the South and attacks the bean crop. For years we have been sending men into Mexico to hunt for its native enemies. Some of these have been found but the menace to the bean crop is not yet defeated and the parasite hunters are still working on the task.

*Some of the Newest Plagues Out*

The European corn borer is one of the new plagues. It gets into the stalk of the corn and blights it. It gets in the middle of the cob and spoils the ear. It is one of the plagues that is just now harassing the agriculturist. The parasite hunters are abroad in search of those insects that, in other lands, keep it within bounds. They have established a laboratory in France and there a half-dozen scientific men are at work. They are sending corn borer enemies over all the time which are being established.

There is another newly arrived enemy of the garden abroad in the land, the earwig, which also comes from Europe. The alfalfa weevil is another native of that continent. The scouts in Europe are diligently on the trail of parasites that will master these pests.

It is only the present generation that has, with any degree of understanding and organization, set about a systematic fight on the insects. This idea of fighting insects with insects had its first striking demonstration when, back in the nineties, a scale, introduced from Australia, was wiping out the orange groves of California. Its native enemy, the ladybird beetle, was brought over and, in a year, had wiped it out. Then there followed the fifty-year fight in New England against the gypsy moth, the first great world combing for parasites, the establishment of hundreds of them, the ultimate turning of the tide. Thus were demonstrations put on, new applications of science shown to bring about practical results.

America has taken the lead in this fight, probably because she has suffered most. The great stretches of cultivated lands over here offer an opportunity for the spread of insect pests that is not presented elsewhere. They are introduced and, in the absence of their natural enemies, run riot. In America the summer season is longer than in Europe. Insects coming from that continent are likely to breed more generations in a year than they do at home. This causes them to become overnumerous. We have suffered more than other nations.

So we have developed agencies to fight the insects. The Bureau of Entomology, in the Department of Agriculture, has led the world in its studies of the insect problems. It employs more than 400 trained entomologists, more entomologists than existed in all the world a generation ago. It has developed an idea that is coming to be accepted all around the world. That idea is that man's greatest enemy and rival on this earth is the insect. Man and the insects are the two groups in the animal kingdom that are gaining in strength. The theory is that the insects are gaining faster than man, and that they may, in the end, do him to death by the simple means of eating up all his food. Man is inadvertently helping them to this end. He is furnishing them transportation that gives them new starts in new lands. He is killing off their prime enemies, the birds. In his crops he is providing them with food supplies such as they did not formerly possess. Recently, however, he has estimated the situation and thought of taking action to check this enemy. Now, finally, the conclusion has been reached that the most effective manner of campaign is that of setting insect to fight insect. So has an idea been born into the world that promises to develop vast possibilities.

*Insects Pave the Way for Famine*

The study of parasites is becoming world wide. Most nations are establishing bureaus of entomology modeled on our own. There is a commendable comradery among them. If a troublesome insect appears in Italy, for instance, that country sends out a bulletin to the entomological bureaus all around the world, asking for information on it. If we get a plague from Switzerland, we ask the nations of Europe for advice. The insect hunters of this country, wherever they go, apply first to the entomological bureaus and often find their work far advanced for them.

*A Ladybird Hotel Is Provided at Sacramento*

The end to which these experts on parasites are working is that of establishing parasite depots. The United States, for example, has a depot of ladybird beetles in Sacramento and will supply them to any orange-producing country that finds itself attacked by the scale upon which they feed. It has established a series of parasites of the gypsy moth and, should that pest get a start in New Zealand, or Argentina, it would be glad to help light the back fire. As time goes on the riddle of fighting more and more insects by the use of their parasites will be worked out. More and more depots will be established. Thus may man meet the rising tide of insects, a tide which he has heretofore tended to swell.

## Golden Rule Universal

AN INDICATION of the golden thread that runs through all religions, ancient and modern, pagan and Christian, collected from here and there expressed sentiments upon ideals; Duty, for example, or Diligence, or Tolerance, or Individuality, or Integrity. Everywhere is found exquisite simplicity and inimitable brevity, and everywhere the central idea was the same. Take the precepts on Justice.

Hindu. Do not force upon thy neighbor a hat that hurts thine own head.

Persian. Avoid everything calculated to injure others.

Chinese. He who strives to treat others as he would be treated by them will not fail to come near to the perfect life.

Grecian. He who commits injustice is always more unhappy than he who suffers from it.

Roman. Let not another's guilt make you sin.

Jewish. Thou shalt love they neighbor as thyself.

Christian. Whatsoever ye would that men should do unto you, do ye even so unto them.

If shaving leaves your skin inflamed

INGRAM'S Therapeutic Shaving Cream is made particularly for you. It is more than a rapid beard softener—it prevents all after-shaving irritation and heals troublesome little cuts. It leaves your skin smooth, cool, invigorated and refreshed.

Thousands of men have told us that it makes shaving a pleasure—no longer a job to be dreaded.

If your druggist cannot supply you, send 50c. for the blue jar that contains six months of shaving comfort. Or send two cent stamp for sample.

# O. Henry at Work and Play

(*Concluded from page 5*)

need of money, it is interesting as referring to his story, *Thimble-Thimble*, for which he was paid $200, a bargain price, as he facetiously says, in view of the fact that presently he was to receive from $500 to $750 and even $1,000 each for his stories:

"My dear Colonel Griffith: If you've got $100 right in your desk drawer you can have my next story, which will be ready for delivery next Tuesday at the latest. That will pay half; the other half on delivery.

"I'm always wanting money & I have to have a century this morning.

"I just wanted to give you a chance at the story at summer rates, if you want it.

"Please give the bearer a positive answer, as I'll have to know at once so as to place it elsewhere this forenoon. Yours very truly, Sydney Porter.

"P. S. Story guaranteed satisfactory or another supplied."

Readers of O. Henry need not be reminded that the *Thimble-Thimble* story, to which the foregoing letter refers, is a "trick" tale, on the order of Stockton's *Lady or the Tiger*.

Another letter, of even more interest to the great and growing audience of this master story writer, is not dated, but was written sometime in 1908, and is notable as disclosing his method of writing (always leaving a title, for instance, until a story was finished), and as referring to what has come to be regarded as perhaps the greatest of his tales. In a symposium conducted by the New York *Times* in 1914, in which some twenty of the foremost American fiction writers named what they considered the greatest American short story, the one referred to in this letter—*A Municipal Report*—received the largest number of votes, including that of Richard Harding Davis.

It will be observed that the author deliberately locates the scene of the story at Nashville, Tennessee, because Frank Norris, the novelist, had once said sarcastically, "Think of anything happening in Nashville, Tennessee!" As a further preface to this letter is the following extract from one written by Mrs. William Sydney Porter (his widow) in which she places this story at the head of a list which she regards as his ten best stories, with this qualification: "After all, I am not sure that it is *the* story—good as it is—for O. Henry's own face lifts from a Nashville (newspaper) 'roast' that was given that story, and I hear his puzzled, 'Why did it offend? Do you see anything in it that should offend?' " The letter follows:

"Title will follow with the remainder—have to take time on titles."

"My dear Colonel: The story—(you will please understand that this scenario does not give the effect) ends as follows:

"The old negro carriage driver is a relic of the old South. He is a night-hawk and a ruffian (probably) but his piratical depredations upon travelers & transients are for the sole purpose of supporting an elderly lady (the poetess) who is the last of the family to which he once belonged. All his small earnings are contributed to that end.

"Major Caswell, a type of the degraded Southerner, is living off the slender income of his relative (Azalea Adair). He is the rat & utterly despicable.

"Azalea Adair is a type of the tenderly nurtured lady of the old régime, but who is drained of her resources (furnished principally by the old negro) by her impossible relative.

"In the end there is a dramatic & mysterious murder, the victim being Major Caswell. The 'snapper' comes in the last paragraph, revealing the slayer by a bare intimation. The whole scheme is to show that an absolutely prosaic and conventional town (such as Nashville) can equal San Francisco, Bagdad or Paris when it comes to a human story.

"The beginning of the story is not yet written—there will be 2 or 3 pages (to follow) containing references to Frank Norris's lines in which the words occur—'think of anything happening in Nashville, Tennessee!' I have to look this up in *Putnam's Magazine*.

"It will work out all right.

"P. S. Your money back if you want it.

"P. P. S. Send the dough to the Caledonia. I'll wait here for it. And send it soon.

"There's just space enough here to send you my pussonal regyards."

That story having been accepted and published, another one was forthcoming presently as a sequel to an advance payment in full for, I think, the story entitled *Next to Reading Matter*. The letter says:

"Thanks. Ain't it nice to pull together during the hard times?

"I know this arrangement ain't a precedent with you or me, because it is a precedential year (laughter). Pretty soon I'll raise my prices cheerfully; and you'll meet 'em with a smile. There's a good time coming, even if it's a good time coming.

"Greetings and salaam.

"I'll try to make the story A. I. Yours as Usual, O. H."

It is my recollection that the prophecy O. Henry made with regard to a raise in rates was realized with startling suddenness, so startling that when he asked $500 for the next story he submitted, the business office, especially the publisher, declared it exorbitant and a reflection upon my bargaining ability. However, I had contracted for the story (I forget its title) and the price mentioned was paid. Circumstances made it advisable to resell it to another publication, and when no difficulty was experienced in getting $750 for it, another story was ordered from O. Henry. It turned out to be the titular tale of his volume, *Strictly Business*, and the following letter, dated July 10, 1908, having reference to it, was written from Good Ground, Long Island, where the author, with his wife and daughter, had taken a cottage for the summer. The letter is of more especial interest in that it makes note of the beginning of the gradual physical breakdown which culminated two years later. During that interim O. Henry frequently confessed to me that he would sit all day, pencil or pen in hand (he usually wrote with a pencil on yellow paper), at his little table in the West Twenty-sixth street apartment and find himself unable to write more than a paragraph. The letter reads:

"She'll be up in just a day or two—the first of next week at the outside.

"I've been kind of an invalid lately; but am rejuvenating in this fine cool air.

"Glad to hear you are extending the scope of *The Broadway*. It reads pretty good to me as it is. I intend to do some better work this summer down here; and I expect the story coming to you will show it—some anyhow.

"Some time when you can, like to have you run down here for a few days.—Nothing much to promise you except plenty of good grub, fine sailing & cold, cold nights under cover.

"Story in a few days—sure pop."

Shortly after writing the following note, with reference to the same story, O. Henry returned to New York to finish it. He found it difficult to write in the country, missing the sights and sounds and smells of the city of his inspiration. The story was completed and delivered as promised, the afternoon of the day this note was written:

"I was called out of town in a hurry Saturday night, in spite of my infirmities.

"Here's all of the story except about 8 or 10 pages which I am doing now—They'll be with you before 2 o'clock today.

"Will communicate with you personally or 'phonically later about the week-end stunt.

"P. S. Be Kam."

The "week-end stunt" referred to was a visit to his place at Good Ground, on Long Island, some forty miles from New York. En route together by train, I recall the speechless indignation of the Negro parlor car porter who, while using his whiskbroom on us, awesomely informed O. Henry that the young lady he had just been "handsoming" was John Drew's daughter.

"John Drew?" repeated O. Henry, with simulated ignorance. "Who's that?"

"Mistah Drew—John Drew, the actah," panted the busy but informative porter.

Turning to me, O. Henry inquired, "Colonel, did you ever hear of John Drew?"

I properly professed my lack of hearing, and the porter was rendered a bit apoplectic when O. Henry murmured to him, "My friend here is the son of P. T. Barnum, and he has never heard of John Drew. So you must be mistaken." Wherewith he characteristically cushioned his target with a five-dollar bill.

# 'Grandmother's Band Boxes

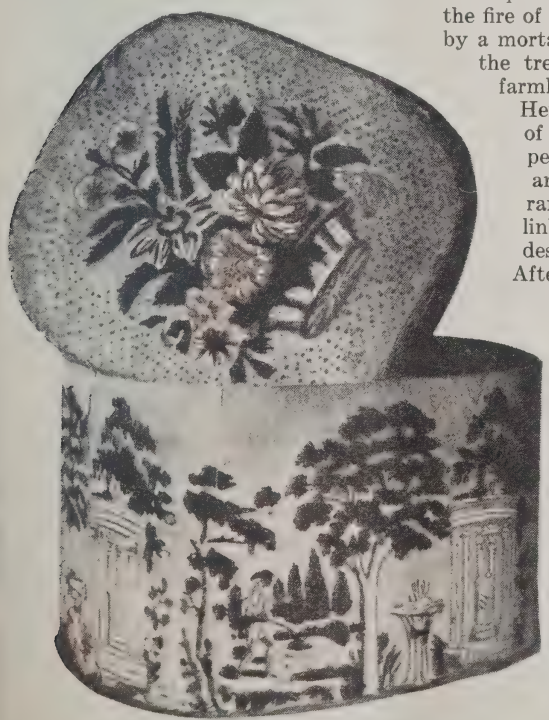
Grandmother chose often bandboxes that represented the flowers that grew in her garden.

(*Continued from page 13*)

made of pasteboard, with a covering of paper, pictured by printing with a hand press from wooden blocks, necessitating often three or four impressions in order to give them a wonderful range of coloring, from light to brilliant yellow, exquisite pink; in fact, all the colors of the rainbow have been shown.

Among the prominent designs was the State House, in New York, the Deaf and Blind Asylum, also in the same city. The first being shown on exterior and the latter designed for the cover. Old landmarks were also immortalized, for we come across the first capitol in Washington, combined in cover by the Deaf and Dumb Asylum of New York which formerly stood in the vicinity of Madison Square. This illustration shows a velvety lawn, dotted with trees, the central feature being a flight of steps at the entrance.

New York and not Venice is represented on the "Grand Canal" bandbox, the canal boat being drawn in a storm by mule power. Underneath is pictured an old aqueduct feeding a waterfall that dashes by the side of a mill. "The windmill and railroad" show horsepower as used for the drawing of rude cars, loaded with wood and varied freight. A primitive windmill is commonly featured in the landscape, which shows a simplicity of treatment that, combined with rich coloring, makes it most interesting.



Military subjects were rivaled only by naval scenes. The former represents both infantry and cavalry executing their drills as performed during the Revolution. Favorite subjects of the latter are ships and shipping, particularly a view depicting the Sandyhook lighthouse with a full-rigged ship tossing to and fro upon a tempestuous sea, close by. This forms the side of the bandbox, the cover showing a man sailing a boat amid mystical mountain isles, covered with fantastic buildings.

Flower representations were in favor with the ladies, more especially those picturing artistic bits of garden where sported the gaudy peacock, its fan-like tail reflecting iridescent hues. This and the grapevine pattern are the ones found today pictured on old-time bandboxes.

Doubtless the hunting pictures originated on the gentlemen's bandboxes, being masculine in trend. They frequently depicted four huntsmen in full regalia resting after capturing the brush. This covers the top of the box, the sides picturing the coach and four waiting to convey them home.

Bridal boxes were generally finished in dull yellow and browns. Venus was a favorite subject chosen, one cover in particular representing a dancing scene in which the goddess is the central feature. The sides exhibited a Temple of Venus with altar and grove, the fire of the former being replenished by a mortal partially concealed among the trees. For the country folk, farmhouses were most prevalent. Here we find the different types of houses designed at that period, together with gardens and animals. This style is rarely found, but forms a link in collecting the different designs.

After the Revolution came a decided change in popular taste and the spread eagle, pictured on both cover and sides, came into vogue. Generals who had immortalized themselves in battle were also a favorite theme; particularly is Zachary Taylor found displayed on horseback overlooking the snowy camp tents. Where can we find among great-grandmother's belongings anything that equals the old-time bandboxes in historic interest, or that lends itself more adeptly to the interior decorating of today?

Sometimes the flowers were arranged in a basket. The bandbox showing temples and groves of trees.

The paper with which these were covered was at first made in Europe, and imported into our country, utilized for bandbox purposes only. Later on when we instituted paper making in our country, importation was practically done away with. Bandbox making became such an important industry that it was extensively advertised in the local papers. One of the insertions just after the Revolution shows the interest felt in them:

"Joseph S. Tillinghast,
Importer of
French Paper Hangings
and
Band Box Manufacture
Four doors west of the mansion house
Union Street,
New Bedford."

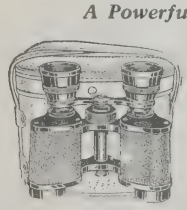
Within the last few years the interior decorator has realized the qualifications of these old pictured boxes and this discovery has forced a higher money value making them in price almost prohibitive. For this line of work their value depends largely upon their freshness, coloring, and size, but even dingy ones can be brightened by careful cleaning. Fortunate is he who possesses one or more of these treasures which can be utilized for decorative purposes in his home.

They are most attractive when used for waste paper baskets, not only in the library but the living room; all they require is a lining of paper cloth to hide the inside which is often an old newspaper or a dull, uninteresting white finish. Care should be taken in the choice of linings, choosing colors that will blend with the tones of the covering. Finish the top in a binding of bright-colored dress braid if designed for a colonial room, but for a twentieth-century apartment use silk harmonizing with the color scheme of the exterior.

Lamp shades can be most effectively designed through the use of this same

pictured bandbox. Toned by filet lace, they are much more effective if they are worked out in the same manner as the French do. What more artistic use could be chosen for them than this, for certainly they do add softness when used to conceal an electric light bulb.

These are very easily made, all one has to do is to remove the bottom and cover before slipping it over a wire frame that has been made exactly to fit it. Before using sew it on to a pasteboard frame finishing the top and the bottom with silk or braid. If when finished there is too much space at the top, sew a piece of silk in harmony with the color scheme; it will serve the double purpose of filling in the space and adding to its attractiveness while throwing the light more fully down on the table.



Your library is probably finished in dark wood and will need a bit of color to brighten it. Here the small bandboxes come into play. Line them with a bright bit of silk and place one on each end of the large writing table for the filing of bills, and so on. The effect is almost magical, enhanced, if a lamp shade and waste paper basket can be utilized to balance the decorative scheme.

We have dealt with the box solely, but the covers are fully as interesting and well fitted for wall decoration. When framed as pictures they resemble an old-time English print, in their rich coloring. The most effective way to work out a scheme is the use of a black glass mat framing it with a single black line, the type procurable for a medium price at almost any picture store.

For tray bottoms inserted in a plain gilt picture frame they are charming and quite out of the usual. Should your tray-lining become defaced it can be freshened through the use of one of the most decorative types of bandbox cover, being placed beneath the glass.

For chamber use, any carpenter can fashion a frame dividing it into partitions, high enough to allow a couple of these pictured boxes to slip into the shelves. They are useful to hold either laces or bonnets. The practical housewife can conjure up innumerable other ways decoratively to use this old-time feature so reminiscent of colonial days.

**Highest Grade Prism Binocular**
*A Powerful 8x Glass*

25 MM. Objective **$19.50**

Highest grade French 8-power day and night achromatic lenses; rack and pinion adjustment; weighs only 19 oz. Right eyepiece individual focus. **Brand new, not a war glass. Complete with leather case, postpaid in U. S., or will ship parcel post C.O.D., $19.50.** Our glasses sold on absolute money-back guarantee.

**BAKER & KIMBALL, Inc.**
385 South St. Est. 1913 Boston, Mass.

## State Tourist Bureaus

IN AUSTRALIA the government dabbles in all kinds of business and has found that in some it is easier to lose money than to make it. One line, though, in which an outstanding success has been scored both financially and from a standpoint of public service, is that of the state tourist bureaus, most notable of which is the one conducted by New South Wales, largest of Australian states.

This bureau, with headquarters in Challis House, Sydney, began as a public convenience. About 1920 it was put on a business basis, charged up with the amount of money the state had invested in it, given control of government-owned resort hotels and properties, and systematized throughout along lines of modern business efficiency. Its publicity department, ably handled, went after business from residents as well as from tourists from the outside, and its routing department arranged trips from a one-day sightseeing jaunt to any size desired.

Moderate rates are charged for everything and when one buys tickets from the bureau they include practically every item of expense he will encounter on his tour—railways, motors, hotels, meals and even morning and afternoon tea.

The Jenolan caves in the Blue Mountains are the greatest attraction in New South Wales, with many thousands of visitors yearly. Next in popularity is Mt. Kosciusko, famed as the only place in Australia where there is snow in the winter months of June, July and August. It is both a winter resort and a summer resort. Other places of interest include the Yarrangobilly caves, Abercrombie caves, Wombeyan caves, Bulli Pass, Sublime Point, river, lake and ocean beach resorts.

Some of these are not money makers for the tourist bureau, but that does not prevent it from giving as excellent service to the tourist as it does to the others. The big attractions help to maintain the lesser and the business showing at the end of the year shows a credit balance for all.

For the fiscal year ending June 30, 1924, the New South Wales tourist bureau showed a gross profit from all sources of 23,755 pounds sterling, approximately $116,000. After allowing for salaries, interest on capital invested, depreciation and contingencies there remained a profit of $45,000 to $50,000. The Jenolan caves had brought in more than $60,000 and Mt. Kosciusko more than $10,000 of the gross profit.

Considering that the traveler saves money as compared with any individually routed trips, gets excellent service everywhere and has expert aid in seeing that the time he has for his tour is all devoted to things worth while, and that the tourist bureau makes a profit for the state in rendering such service, its complete success is unquestionable.

## Robbing the Public by Post

(*Continued from page 8*)

were carried to the twentieth series of lengths, more than a billion persons would be entitled to ten dollars' worth of goods at only one dollar's cost. This case was the subject of a fraud order, which is being contested in the courts. Yet virtually no newspaper, even in the city where the concern operated, mentioned it.

And there has been like avoidance of publicity of general character of "home work" schemes of which there has been an epidemic, several of which have been the subject of Post Office Department fraud orders. The promoters of many of these have been "aided and abetted" by some of the most reputable newspapers and magazines.

"Most all home work schemes are frauds," says the Buffalo, New York, Better Business Bureau which has had occasion to investigate several of them. What it means, evidently, are the advertising ones. The writer knows one, that doesn't advertise, which is entirely legitimate and successful. Its operators have no occasion for advertising for workers, and they state that many desirable ones could not be procured that way.

There are many variants of the fraudulent "home work" scheme and all are so plausible that it is almost impossible for unknowing persons to discern, from the advertising, their elements of fraud. They offer to sell machines with which to do the work, guaranteeing to buy back the product at good prices. But when the product is sent in it usually fails to pass inspection and is returned. They advertise for lists of names and addresses, first selling an "outfit" for preparing them, and then the victims are told to sell the lists directly to mail order houses. Various kinds of outfits are sold for doing many kinds of work, on "buy back" guaranties that are worthless. Courses of study by correspondence are sold with the pledge that employment will be supplied or procured for students who "pass," few of whom ever do so to the satisfaction of the promoters.

Of these schemes—aided and abetted by many "recognized" advertising agencies and "reputable" periodicals—the general public knows nothing, as it knows very little of the methods used in operating many others. One reason perhaps why "sucker lists" are so valuable to these operators is that defrauded persons rarely are advised as to how they were mulcted, and keep on biting at other schemes in the hope of getting their money back. Some operators keep going successfully even after fraud orders are issued against them. They tell their dupes to remit by express instead of the mails

and many, knowing nothing of the integrals of the scheme, do so.

An effort was made to get a definition of the attitude of organized advertisers as to the agency factor but it was unavailing. The attitude of the run of high-grade publishers is fairly presented probably in the following:

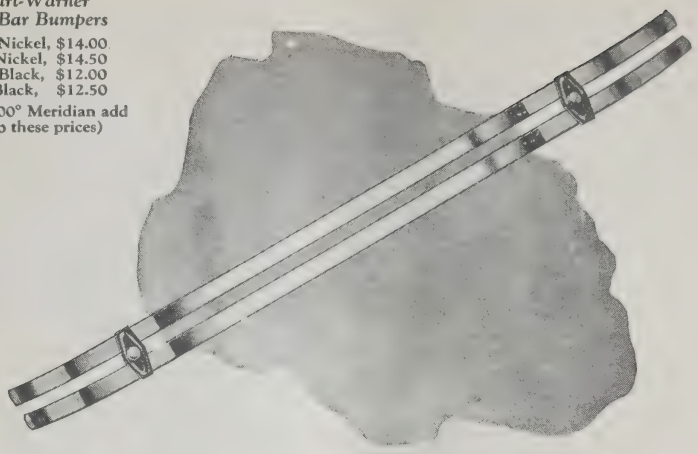
The *Saturday Evening Post* was written and asked as to the responsibility of persons for whom that magazine recently was running a "home work" advertisement. One of its advertising managers replied as follows:

"For your information we wish to explain that we do not guarantee the advertising that appears in the columns of our publications, but before accepting any advertising it is our policy to investigate the moral and financial standing of the advertiser in so far as possible for us to do so. The appearance of such advertising in the columns of our publications is evidence that the information received upon investigation is satisfactory to us."

A statement which may mean much or little, depending on the character of the paper and its publishers—in this particular instance, very high.

The following conclusions seem to be justifiable:

1. The public is led to believe that the Post Office Department protects the mails from fraudulent operators and that the organized advertising profession policies advertising with the view of preventing its use, via the mails, by outright crooks. Possibly ten per cent of all mail-fraud operations—which, according to the authorities, take a billion dollars or more a year from the public—are apprehended and stopped by postal officials; but only, as a rule, after they have gone on profitably for varying periods of time. While advertising is policed in a measure by organizations like the National Vigilance Committee of the Associated Advertising Clubs and the Better Business Bureaus, it is done inadequately.



2. While perhaps the run of them will have naught to do with advertising crooks, it is easy for mail-fraud operators to get service from some recognized advertising agencies, as well as from many that are not recognized.

3. Though many newspapers and magazines will not "knowingly" accept fraudulent copy, numerous other ones apparently will do so.

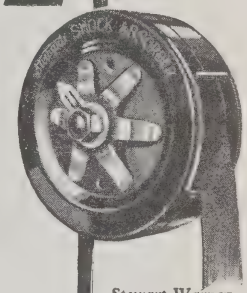
4. While a measure of war is waged by both the government and private organizations against the immediate promoters of fraud schemes, little is done toward combating the chief and necessary intermediaries.

5. Though there is much informative propaganda on the subject, the public is insufficiently informed concerning these schemes; in fact, one might be justified in suggesting the existence of a "conspiracy of silence, but not a duly formulated one, to prevent disturbing but enlightening information from reaching the general public.

*Stewart-Warner*
*Double Bar Bumpers*
Front—Nickel, $14.00
Rear—Nickel, $14.50
Front—Black, $12.00
Rear—Black, $12.50
(West of 100° Meridian add $2.50 to these prices)

# Equip Your Car for Today's Traffic—

BEFORE you take your new car out on the busy highway, by all means have your dealer install Stewart-Warner Bumpers —front and rear.



They will pay for themselves many times over in the protection they will give your motor car investment—as well as the satisfaction of safety you will enjoy.

Shock absorbers, also, are essential- giving greatly increased comfort and preventing dangerous "bouncing."

Stewart-Warner Electric Windshield Cleaner, Spotlights, Rear Vision Mirror, and Heaters are now recognized as necessities, especially during the winter months.

Equip your car with Stewart-Warner Accessories for today's traffic.

# Why and How It Is "America"

(*Concluded from page 15*)

one of the greatest treasures among books, "The VVhole Booke of Psalmes Faithfully Translated into English Metre. Whereunto is prefixed a discourse declaring not only the lawfullnes, but also the necessity of the heavenly Ordinance of singing Scripture Psalmes in the Churches of God." In the mountain regions of Kentucky and the Carolinas where there is pure American stock the psalm-singing congregations are found today and probably nowhere else in the world are the psalms "lined out," line by line, by the preacher for the congregation to sing.

In New York, William Bradford was the first printer. With his brother Andrew Bradford he set up a press a little later in Philadelphia. The Bradford imprints and any products of the presses of the English Colonies printed before 1700 are treasures found only in a few fortunate American libraries. A New Jersey bookseller came across a rare Bradford imprint and took it to New York to the office of a famous bibliographer. Before the seller had taken the book from under his arm the bibliographer remarked, "I see that you have a Bradford imprint." This type of familiarity is acquired only after long years of experience and only by one who has a kind of sixth sense for books. The bookseller is firmly convinced that this bibliographer can detect a Bradford imprint by smell.

A careful study of American literature in the period before 1775 reveals clearly the fact that the Stamp Act and the other commonly accepted immediate causes of the Revolutionary War were only incidents in a long series of events which were leading inevitably to separation. These pre-Revolutionary books of protest and the contemporary material dealing directly with the Revolution are of fundamental importance in understanding the American Revolution. Recently a famous Philadelphia bookseller came into possession of the original copy of the Declaration of Independence as sent to Emperor Frederick the Great. The price placed upon this document was $175,000, but whether it was sold has not been announced. More recently Maggs Brothers, booksellers of London, offered for sale an original copy made by Christopher Columbus, of his Book of Privileges. This important document, one of three copies known to have been made by him, was more modestly priced at $50,000. When one enters this realm of prices there is no comparison of values possible. Such manuscript documents are unique. With them one can compare only the Constitution of the United States, the Magna Charta, and a few other documents.

The most recent entry into the field of rare books are so-called Western Americana. The first books printed in California and the early laws of the western states command high prices. Early volumes, before 1850, which deal with emigration to the West, are also prized. The first newspapers of the West and Middle West are being sought by the many historical societies and libraries of this region.

Our knowledge of many minute details and of all fundamental elements of American history has been furthered by collectors of Americana. With almost prophetic vision the great and enduring documents of wide human interest have been sought and found and treasured by individuals afflicted with the mania for collecting. The prices paid for old American books by individuals whose sanity is well attested by their success in commercial fields has resulted in saving from destruction numerous invaluable documents. Largely due to the activity of collectors state historical societies have been organized and have contributed no little to the preservation of precious historical documents.

Like Ferdinand Columbus, many great American collectors have been inspired with a zeal for the spread of learning and so the priceless treasures of American history are made available to the qualified student, frequently too poor to own the most common books. The most recent gift to the public of a wonderful collection is the gift of the J. P. Morgan Library in New York City which would be modestly appraised at ten million dollars. Every gift of this kind removes forever from the market thousands of rare books. This serves to decrease the supply of rare books and thus, incidentally, with the growing demand, to increase prices. The truly great collector has been almost without exception the true lover of literature and history, able to appreciate the best in books. Both in literature and in history the cause of learning has been furthered by such collectors.

# Americanisms

AMERICANISMS, in language, may be termed those words and phrases peculiar to the United States and Canada that have originated in America or that have emigrated from Britain and continued in use here until obsolete, or nearly so, in Britain.

Certain newly coined American expressions indicate their origin on the frontier or in the forests. Our first settlers clearing the farming land on the Atlantic seaboard worked constantly on guard to preserve their lives and possessions from the inroads of the savages. Here originated such expressions as *going on the warpath, digging up the hatchet, burying the hatchet, clearing, to draw a bead, fight fire, a gone coon, salt-lick, hogwallow, raft, timber, paleface, Indian summer, trapper, scalping, took to the timber.*

Later on as the pioneer pushed westward to the Lake States, the Mississippi Valley and the Far West such expressions as *blazing out, cache, prairie schooner, squatter, squaw man* and *log-rolling* came into being. Western ranch life gave us such words as *corral, cowboy, tenderfoot, buckaroo, round-up, maverick, stampede, lariat;* the mining regions supplied *bed rock, grubstake, claim, prospect, placer, diggings, bonanza, pan-out* and *poke.* In the sparsely settled districts the necessity for neighborly help in gathering in the harvest or erecting buildings led to the custom of the *raising bee* or *building bee,* the *quilting bee,* the *husking bee,* and latterly the *spelling bee.*

Among the many English words used in America in a different or perverted sense are *barn,* for stable; *boards,* for deals; *corn,* for maize, whereas in England it means grain of any kind, in Scotland, oats, and in Ireland, barley; *cracker,* for biscuit; *depot,* for station; *dress,* for gown; *baggage,* for luggage; to *jew,* to haggle—in England, to cheat; *likely,* for promising; to *mail,* for to post; *reliable,* for trustworthy; *saloon* (happily a thing of the past—?—) for taproom; *smart,* for talented; *store,* for shop; *ugly,* for ill-natured. In America we also use different words for the same thing, as *conductor,* for guard; *editorial,* for leader; *elevator,* for lift. We also have examples of American words retaining their old English meaning. For instance, *fleshy,* in the sense of stout; *sick,* in the sense of ill; and *wilt,* a "provincialism" in England, in the sense of wither. *Right here, right now, right away,* are Americanisms and are not found in the colloquial speech of Britain.

When one remembers that the dialects of the counties in England alone have such marked differences that a Lancashire miner and Lincolnshire farmer can with difficulty understand each other, we may well be proud that a country as vast as ours has one common accent. More especially so when we consider the heavy influx of European immigrants from non-English-speaking countries. Because of the increasing foreign element in America our teachers are forced to devote much time to the teaching of English, a thing regarded in Britain as unnecessary, because the stock is more or less uniform.

A cartoonist is handicapped by speed.

# How Cartoons Are Made

(*Continued from page 17*)

years that the word *cartoon*, used in its modern sense, has appeared in the dictionaries. Up to the year 1843, a cartoon was a design which served as a model or study used in making frescoes, studies, and so on. An exhibition of such cartoons, many of them with enormous designs, was held in London with "a view to ultimate execution on the walls of the Palace at Westminster." This gave John Leech, the celebrated artist of *Punch*, a glorious opportunity to burlesque the whole exhibition. He drew a burlesque picture, representing a humble crowd of needy visitors to the exhibition of pictures on a suggested "free day" in accordance with the recommendation of the government. This design was itself suggested by Jerrold and entitled *Substance and Shadow* with the legend "The Poor Ask for Bread, and the Philanthropy of the State Accords—an Exhibition." M. H. Spielmann in his *History of Punch* says that after using these drawings and a number of others satirizing various public abuses, "*Punch* for a long time dropped the word cartoon, but the public remembered it and has clung to it ever since." It is not only remarkable that the word cartoon thus originated in the *Punch* office but the method of getting up a cartoon then is the same method which prevails today, not only in the *Punch* office, but very generally in all editorial offices. It is thus described by Mr. Spielmann, when the editorial weekly dinner is over and the coffee finished.

"Then the editor, who has been presiding, invites ideas and discussion on the subject of the 'big cut' as the cartoon is commonly called; and no two men listen more eagerly to the replies—suggestions that may be hazarded, or proposals dogmatically slapped down—than Mr. Burnand, who is responsible for the subject, and Sir John Tenniel, whose duty it will be to realize the conception. (This account was written many years ago when Burnand was editor and Tenniel chief cartoonist.) The latter makes few remarks; he waits, reflects, and weighs, thinking not so much, perhaps, of the political or social, as of the artistic possibilities of the subjects as they are brought up, and other points that recommend themselves both to the artistic and literary members of the staff . . . On one occasion, when Mark Lemon was editor and Shirley Brooks was recognized as the best suggestor, an exceptional incident took place. The subject was duly decided upon and Brooks went home. After he was gone, and none but Mark Lemon, Charles Keene, Sir John Tenniel and Henry Silver were left, Keene, to the surprise of the rest, made a suggestion in connection with the American war (Civil War) then being waged, that was immediately accepted as vastly superior to that which had previously been adopted; and the future editor was much astonished when he opened his paper on the following Tuesday and his eyes fell on a different and wholly unexpected cartoon."

In this country, however, at the present time, with certain exceptions, our cartoonists are much more independent than the previous description implies. Our method, as stated, is for the cartoonist to submit his pencil sketches first, but it almost always happens that the best cartoons are evolved by two minds working together. This is the ideal way. For a great many years I have (more or less humbly, I hope) assisted artists in this way. In these circumstances, sometimes the idea comes so quickly and inevitably that the whole affair is over in a jiffy. These ideas seem purely inspirational, so swiftly do they come, but to be accurate those which are born in travail and come slowly are frequently the best.

Theodore Roosevelt was the only public man I know who made no objection to the cartoons published about him but when they were particularly violent frequently sent a word of appreciation and asked for the original—which was invariably sent. When he was in the White House these cartoons were displayed by him to his intimates with great glee. Before America got into the late war we published a drawing by W. H. Walker showing some people in front of an aquarium. Behind the glass was a large fish with the head of Woodrow Wilson. The fish was labeled "Weak Fish." This elicited great applause from Mr. Roosevelt. I believe it was during the Taft campaign that one of the National Committees got one of our leading cartoonists to draw a cartoon for its own political purposes and inserted it in *Life* at the regular advertising rates. I discovered it by accident and stopped the press to get it out.

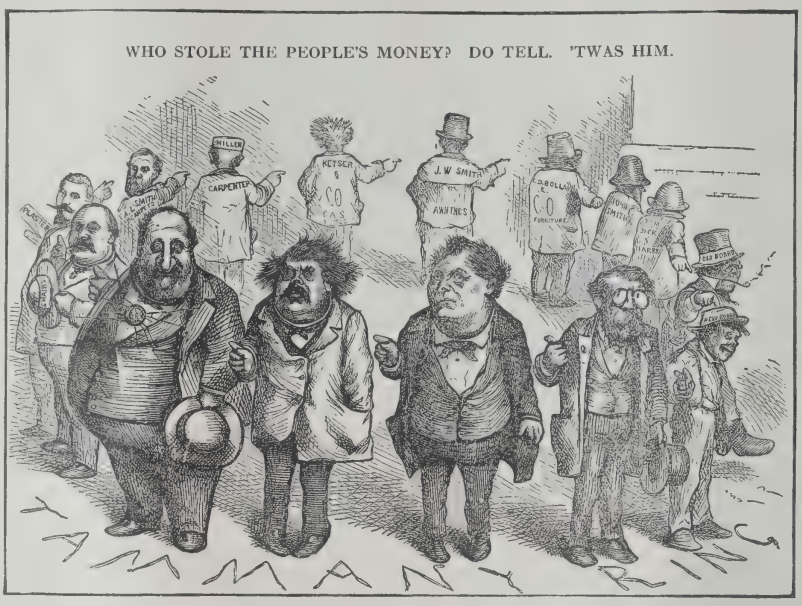
In getting up an idea for a cartoon

Cartoons are effective weapons of artists who have real insigh

there must be on the part of the artist and his collaborator not only perfect sympathy but a kind of combined moral indignation, a sense of injustice. Let us suppose that both of these collaborators are stirred up over the delay of the law. Thus Justice might be portrayed as the Sleeping Beauty, while the prince who is to awaken her with his kiss is pictured as Public Opinion. At this stage the figure of Uncle Sam might be interposed and (as anything in a cartoon is permitted to bring out the idea) he might be saying to the Prince:

"Young man, let her sleep on. I'm so used to seeing her asleep that you mustn't wake her up."

Thus a rebuke would be administered to Uncle Sam for his deplorable laxity, while Justice as a sleeper would reinforce the whole idea.



Cartoons are without doubt the most effective weapons in the hands of artists who have real insight and patriotism. As a medium to hold up Man to satire, to arouse him to a sense of his own defects, as a keen corrector of governmental deficiencies, they are as old as Man himself, when he first drew pictures on the rocks, caricaturing himself.

The oldest drawing in the British Museum is a cartoon dating from 1320 which represents two devils throwing a monk into a river, dealing thus with the Reformation. But as far back as we can go in Egypt we find cartoons satirizing popular customs; for instance, one shows a lady who has been drinking too much, with her maid, the caption being translated "Too Late with the Basin." This dates back several centuries before Christ. In India there is a famous cartoon of the god Krishna on his travels.

To come down to modern times, without doubt, the two most famous cartoons are in England by Tenniel and in America by Tom Nast, whose successful pictorial campaign against the Tweed ring in New York undoubtedly had more influence than any other factor in forming public opinion against Tweed. Sir John Tenniel's cartoon *Dropping the Pilot* has already been referred to. The one by Thomas Nast appeared in *Harper's Weekly*, August 19, 1871, representing a ring of politicians (since called grafters) with Tweed, each one pointing to the one on his right, the caption being:

"Who Stole the People's Money?"
Do Tell—New York Times.
'TWAS HIM

Perhaps the best cartoonists in America today are Herbert Johnson, of the *Saturday Evening Post;* Rollin Kirby,

Nast's famous cartoon printed by the New York *Times* in its campaign against the Tweed ring.

of the New York *World*, and "Ding" of the *Herald Tribune*. Then there are Fitzpatrick, also of the *World;* John McCutcheon, of the Chicago *Tribune;* Sykes, of Philadelphia, and indeed so many more that it would be wrong to set aside any special group or put one before another.

What happens in many cases is that a young man with the "gift" begins doing odd sketches for a local so-called small-town paper. At first his figures are crude but as he gains in facility he also gains in knowledge of affairs; but this, as I have said, is too likely to be superficial. When his work begins to attract outside attention he is gradually called to a larger field of influence and eventually may wind up as the staff cartoonist of one of the largest daily papers.

Among the total number of American cartoonists only comparatively few have studied in Paris. Quite a number, however, have gone over there after their reputations have been acquired. Many have gone through the art schools located in the large centers, New York, Chicago and Philadelphia, and many have made themselves without instruction. E. W. Kemble, creator of the Gold Dust Twins, began as a clerk, I believe, with the Western Union. He amused himself by drawing sketches on his desk pad. One day he left some of these sketches at Harper Brothers in Franklin Square. A few days later he called to learn the result and was paralyzed at being presented with several gold pieces, so much so that he forgot to ride and walked all the way to his home in Harlem, several miles. When he entered the dining room dinner was over and his father started to scold him, whereupon he threw down the gold pieces on the table and shouted, "That's what I made today." He never went back to his desk.

The war gave a great impetus to cartoon making. In England it offered a supreme opportunity to Bruce Bairnsfather, whose war cartoons, very humorous, were an enormous uplift to the Tommies in the trenches Louis Raemakers, the Dutchman, did some of the most dramatic war cartoons. In this country Charles Dana Gibson, C. B. Falls, W. A. Rogers, and many others were great forces in determining public opinion.

Pictures as a medium for conveying truth are being used more and more. A cartoon may have enormous power in molding public opinion and frequently has such power. Some cartoonists pay regular visits to Washington and are deep students, but these are too few. There are, of course, any number of art schools and academies. The thing I have in mind is something different—in effect it would be a school of practical current affairs as they are being so swiftly evolved, the object being to interpret our country pictorially, and to correct abuses pictorially from the highest ground. That is, of course, what every cartoonist is trying to do in his own way, and individual genius should be allowed its course. But this ought also to be done coöperatively so that the total amount of genius is always on tap.

## Origin of Oaths

THE word "curse" in the common saying, "not worth a curse," is a corruption of the old English word "kerse," meaning a wild cherry. Thus, in the *Vision of Piers Plowman*, an allegorical presentation of the world of men, written by William Langland about 1400, we have the passage, "Wisdom and witte now is not worth a kerse."

The expression "O Jimminy" comes from the pagan "O Gemini!" "The dickens!" as an exclamation has nothing to do with the name of Charles Dickens, but is by philologists supposed to be a contraction of the word devilkins.

# Value Determines Demand

It is a basic business principle of the Ford Motor Company that value determines demand.

Never has this principle been better exemplified than in the popularity of the latest Ford cars.

Embodying in even greater measure the familiar Ford characteristics of economy, dependability and utility, the improved cars also have striking beauty and finer riding comforts.

Yet—these finer, more beautiful cars are available at no increase in prices.

That their popularity should be without precedent is entirely logical—the result of applying a proven principle.

FORD MOTOR COMPANY, DETROIT, MICH.

Ford

## "I Read *in* the Papers"

***I read in the papers,*** of England, that a firm of alien money-lenders had got into difficulties as a result of a public campaign against usury. Many borrowers, emboldened to default, have disclosed interesting facts about money lending during bankruptcy proceedings. This firm borrowed funds at *fifty per cent interest* to lend to its clients. "One rather wonders," commented the Official Receiver, "if the debtor described the interest which he paid as excessive, what he called the interest which he charged when he re-lent the money."

The campaign in England is a very serious one. It has led to the Business Names Act by which it is sought to prevent Hebrew money-lenders from taking English names as a cover for their business.

*The International Jew* in 4 volumes: *The International Jew,* Vol. I, 235 pages; *Jewish Activities in the United States,* Vol. II, 256 pages; *Jewish Influence on American Life,* Vol. III, 256 pages; *Aspects of Jewish Power in the United States,* Vol. IV, 246 pages. Price: 25 cents each; set, $1. The Dearborn Publishing Company, Dearborn, Michigan.

***I read in the papers*** a story that reminds me that over a year ago THE DEARBORN INDEPENDENT described how a group of high-pressure stock salesmen under the leadership of Colfax Gibbs had duped investors and involved a lot of country bankers in Western Michigan through the operation of the "myself-note" game. The Detroit *Free Press* says that Gibbs is supposed to be in Florida selling real estate.

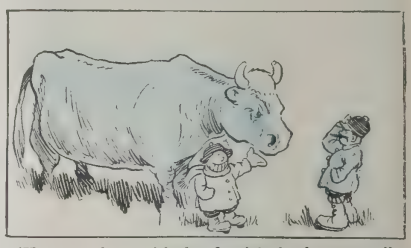
One of Gibbs' former salesmen is now charged with wrecking another Michigan country bank through Florida real estate promotion financing. *This salesman had been paroled from the penitentiary after serving part of a sentence for frauds upon a Michigan investor.* Through what the Michigan Securities Commissioner describes as an "accident" this paroled prisoner and protégé of Gibbs was *again licensed to sell stocks in Michigan* with the result that another bank has been gutted of its resources. The outstanding feature of the Gibbs' "myself-note" game was for his agents to worm themselves into the confidence of small bankers, frequently splitting profits with them, and then proceed to raid the countryside.

People throughout the country are asking why crooks should be turned loose and officially licensed to return to their trade of fleecing investors and ruining banks. Here is something for business men to take up. The bank in question was a private one.

# Who Is Paul Bunyan?

(*Concluded from page 21*)

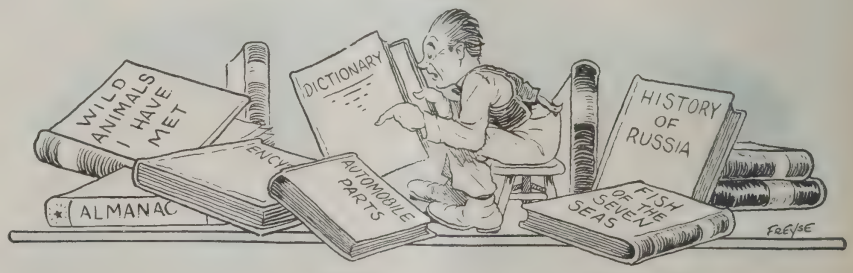
and towed them three times around its circumference before he discovered his 100 per cent mistake. The nearest stream was ten miles away, with high hills in between. Paul had to deal with this situation in person. He summoned Sourdough Sam, the cook, who made everything except coffee out of sourdough, and told him to mix enough dough to fill the big water tank. Babe hauled the tank to the lake and the dough was dumped into it. The dough rose, carrying the logs with it, and swept over the hills like a stream of lava from a great volcano. Tourists often go miles out of their way to see Sourdough Lake in Northern Minnesota.



"The griddle was greased by skating over the surface with hams."

The Seven Axmen of the Red River —folks say they came from "down Bay Chaleur way"—were the best outfit Paul ever had. Mighty workers and prodigious eaters. It was they who cut over the whole of North Dakota from the one camp on the Big Onion, walking to and from their work daily. Each man had three axes and two helpers to carry the spares to the river when they got hot. There was always a danger of setting forest fires. Instead of axhandles the axes were hung on long ropes, and whirling these as they marched through the forests a quarter section of timber fell at every step.

When the Seven Axmen quit Paul he was hard put to do his work. It was then that he invented the two-man saw, half a mile long. He had trouble getting a man to handle the other end with him. This saw worked all right in level country but in rough country it cut only the trees on the hilltops. To remedy this situation Paul had Big Ole build the "down-cutter" —something like a mowing machine. It made the round of eight townships at a time, cutting a swath 500 feet wide.



Paul had a hard time getting cooks with capacity and ingenuity enough to feed the Seven Axmen. After all the others failed he got his cousin, Big Joe, "from three weeks below Quebec." Joe had Big Ole make him a pancake griddle so big you couldn't see across it when the grease was smoking. The batter was stirred in drums, like those of concrete mixers, and poured with pipes manipulated by tackle. "The griddle was greased by colored boys who skated over the surface with hams tied to their feet. They had to have colored boys because they could stand the heat." Cooking operations were made difficult by the deep snowdrifts that piled up on the shanty. Big Joe had to keep digging a flue up through the snow. When it melted it left a hole 178 feet high standing in the air.

The limitations of space forbid selections from bits of stupendous myth about Lucy, the half-Jersey, half-wolf cow; or about Mrs. Paul Bunyan and her son, Jean, which have been recorded by E. S. Shepherd, of Rhinelander, Wisconsin, who worked in Paul's camp on Round River in 1862, "the Winter of the Black Snow." For the same reason nothing can be said about the Reversible Dog, resulting from a bungling surgical operation when an ordinary dog was accidentally

"He was undernourished and weighed only two ton."

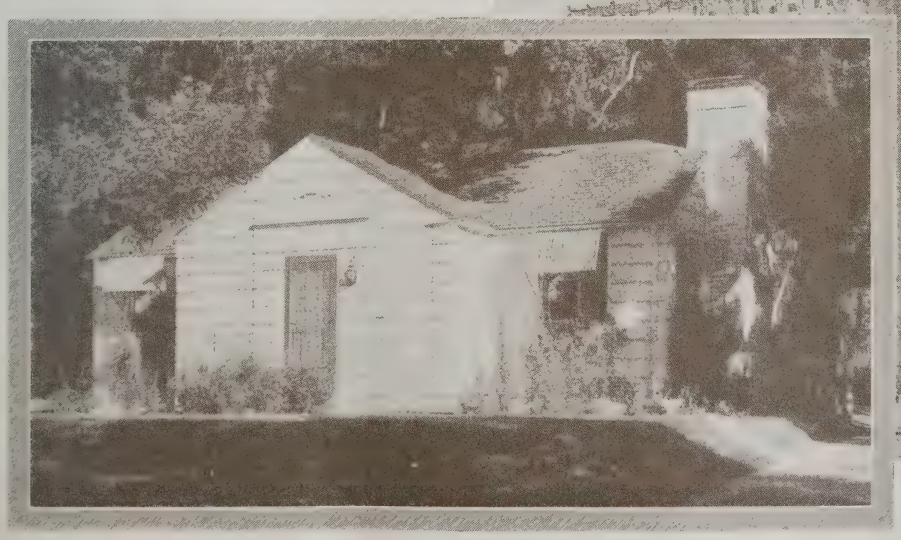
cut in two, the hind legs pointing upward instead of down; about the adventures of The Little Chore Boy, or of others of Paul's human and brute confreres. There are thousands of such anecdotal bits and their number is being daily and nightly added to in the far-flung camps of the lumber industry, chiefly in the camps of the towering firs of the Pacific Northwest, where now, are about the only remaining stands of timber.

"And yet many a well-informed person will ask: 'Who is Paul Bunyan?'"

# "Frozen Music"

## ~we cannot melt it with indifferent glances

by Albert Wood A.I.A



MOST folk enjoy music more than architecture or art. Little conscious effort is required to hear, but considerable conscious effort must be made to see. One does not usually notice whether buildings are fine or ugly; but when musicians perform, one is immediately conscious whether the music is pleasant or not.

From childhood the ear educates the mind to sound; the eye has not developed "conscious seeing." Yet, architecture may be made as music to the layman with a little conscious attention.

Buildings crowded together are distracting, just as museum rooms crowded with pictures are confusing. As well set a dozen orchestras to playing simultaneously, all claiming attention at once.

Concentration on fine pictures and fine buildings will give discernment and discrimination to one's sense of the harmonious, the interesting and the beautiful. Cultivate a courageous eye. Do not be easily misled by critics who overemphasize style or period.

The training of the eye may seem a slow process. Do not be discouraged. Devote ten minutes a day to exercising the eye and presently a new and wonderfully interesting world will open to your gaze—a world peopled with the many fine children of the artists' mind.

Two examples of the beautiful in architecture. The Broadway Temple, above, and a cottage that sings of "Home, Sweet Home."

THERE is more rough and tumble in the American democracy than is altogether agreeable to people of sensitive nerves and refined habits, and the people take their political duties lightly and laughingly, as is, perhaps, neither unnatural nor unbecoming in a young giant. Democracies can no more jump away from their own shadows than the rest of us can. They no doubt sometimes make mistakes and pay honor to men who do not deserve it. But they do this because they believe them worthy of it, and though it be true that the idol is the measure of the worshipper, yet the worship has in it the germ of a nobler religion.

—*James Russell Lowell.*

# Presented in This Issue:

One of the grand old men of this generation is Edwin Markham. Those of us who remember the crash with which his *Man With the Hoe* smashed through the complacency of a generation ago, have some sense of his power. His was a prophet voice. A great painting was made to give its message through a great poet. In presenting this article from Edwin Markham's pen we feel that we are making a distinct contribution to valuable literary history, as well as recalling to present readers great hours now past. (p. 3)

---

Mr. Pinci expresses in a gratifying way some thoughts that in the mind of a long-suffering public have long throbbed for utterance. The truth about the movies is just a matter of common sense, which seems not so common as its name implies. The movies have not yet won the middling intelligent classes (p. 5)

---

SPARE TIME is becoming one of our problems. What to do with *Leisure?* We have more of it than ever before. That means "everybody." For the more restricted "we," all of us say that we are busier then we ever were in our lives. True, but isn't most of it in our *Spare Time?* It is becoming quite a problem. We only hope that no one will be moved to propose a new Government Bureau to take over the regulation of the people's Spare Time. That would be the last straw. (p. 13)

---

Those who give their support to what is called "the Filipinization of the Philippines" should inquire what it means. If it means a stoppage of the beneficial work which has won the admiration of the world, we should go slowly. One thing it undeniably means is the driving out of the English Language and this means a return to the region of dark and primitive ideas. Language is the gateway into the world of light, and a plan which would deprive coming generations of Filipinos of that benefit should be scrutinized with some care. William E. Barton states the case. (p. 7)

---

Copp's Hill, Boston, is a mecca for many pilgrims. Here, overlooking the harbor, is the cemetery where lie many of old New England's notables and some of the obscure ones who took part in the historic "Boston Tea-Party." Down at the corner is the Old North Church in whose belfry, still accessible, was hung the lantern-warning for Paul Revere. It is a place where one lingers on the past. (p. 8)

---

A Maryland physician writes:

Apropos of your article on the "Illustrious Dead," page 13, of THE DEARBORN INDEPENDENT of Sept. 5, I think you will be interested in the following statement in regard to Ex-Governor and Vice-President George Clinton, whom you mention in your first column.

Clinton's body was enclosed in a lead coffin, which parted at one of the seams, and let in water, so that in 1908, 96 years after the burial, when the remains were removed to Albany, N. Y., for interment there, the coffin was full of water. I was asked to examine the body and report anything of interest. . . . .

There were large cavities in the lungs, suggesting that he had possibly died of consumption. D. S. L_____.

Advertising Old and New - 24
*James R. Daniels*

Advertising is a colorful art and is under general discussion. How far it will go, or what its next development of control will be, no one knows. That it performs a public service is indisputable. That, like other good things, it lends itself to misuse, is also certain. But it more speedily comes under the law of retribution for wrong and reward for right than most things. A young writer here discusses the subject from an unusual angle, in a style that promises much for his future work. (p. 24)

---

"Chats With Office Callers" is a new departure. This office is the meeting place of people from all parts of the world, and frequently the content of conversation is of more sprightly interest than is found in carefully considered articles. (p. 12)

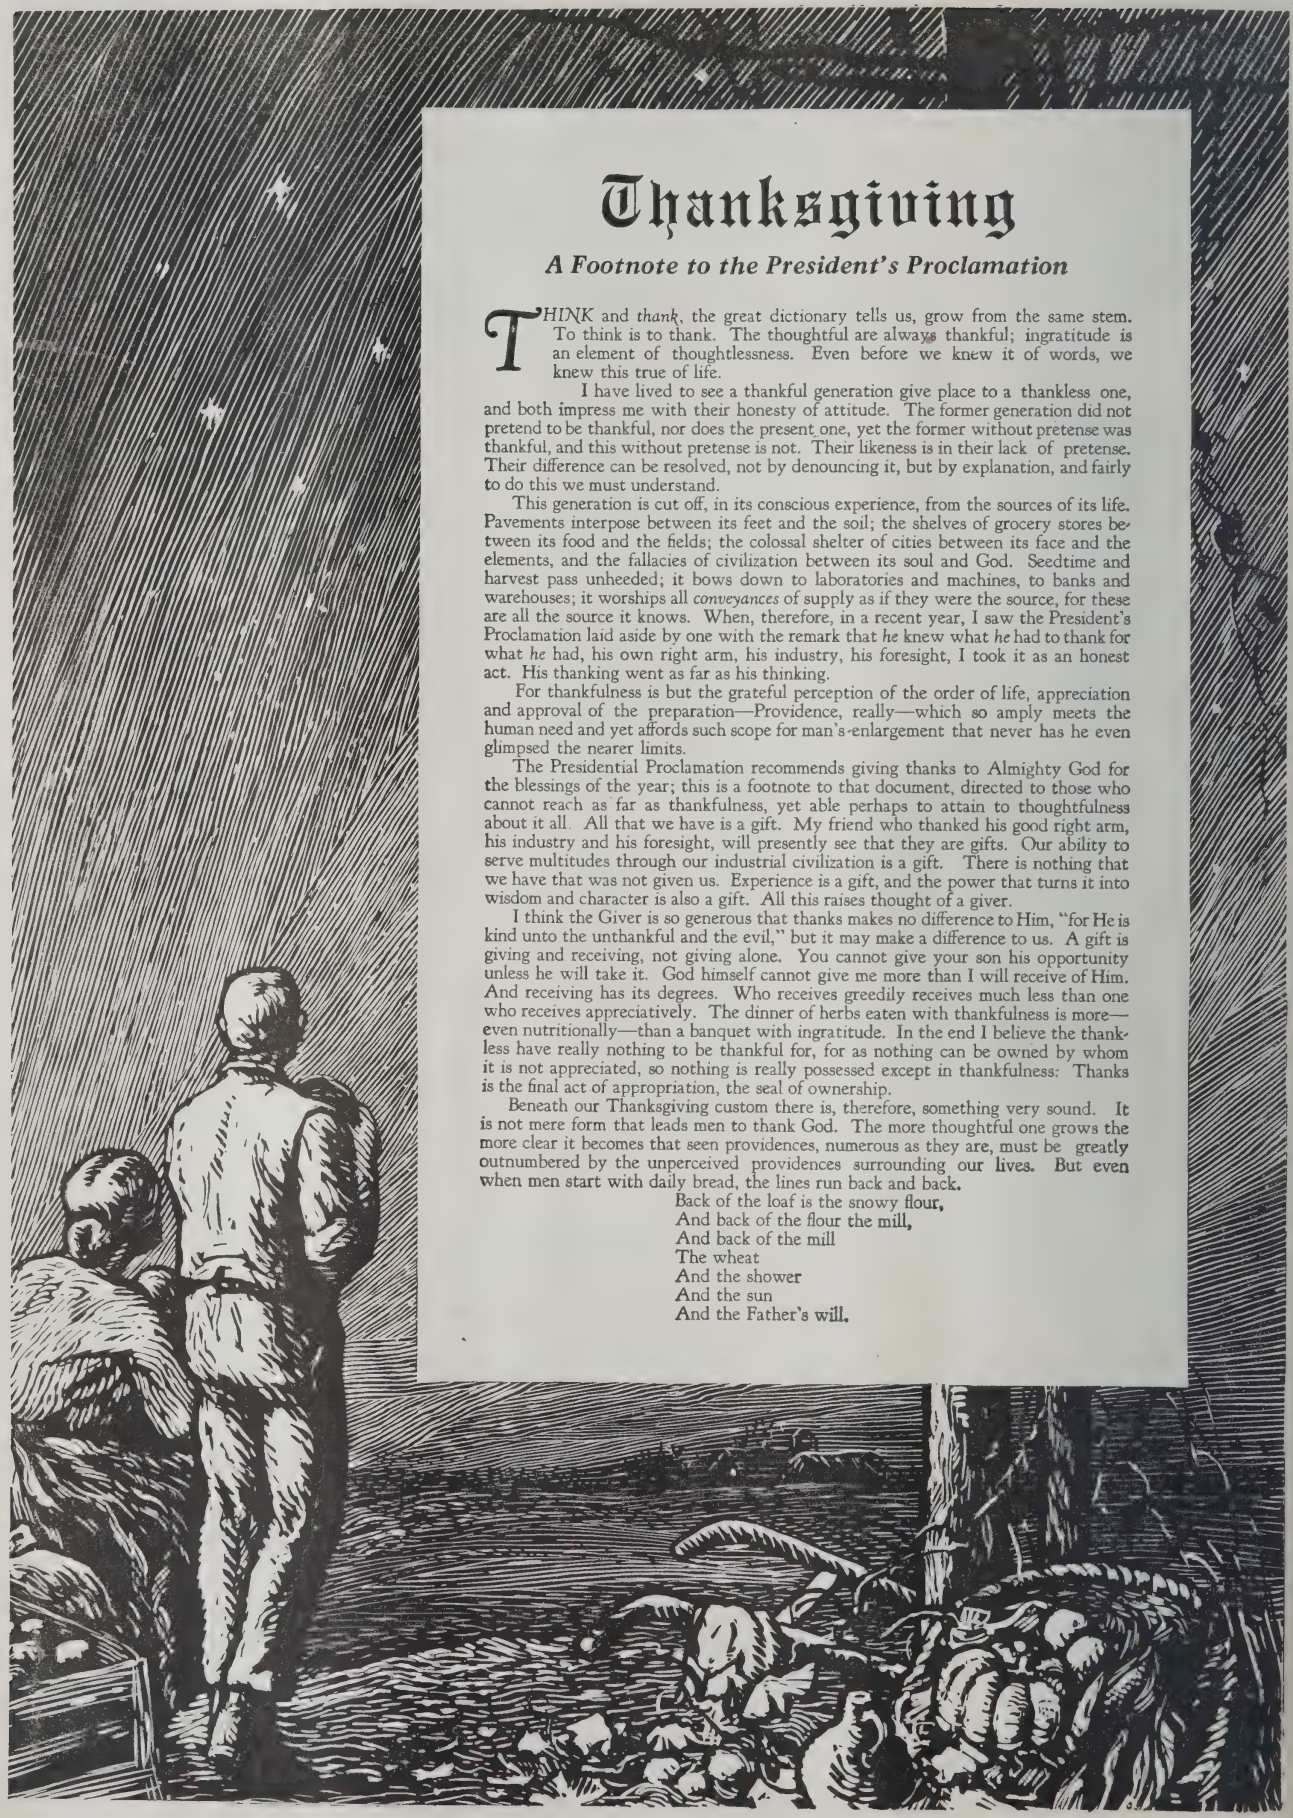
---

This is a Thanksgiving Number. Thanksgiving is an American institution. *Think* and *thank* grow out of the same stem. This is the thought developed in "A Footnote to the President's Proclamation." (p. 2)

---

There are two ways of burning money, but the official way completely destroys it by fire. A page of interesting facts about the physical substance we call money is given this week by Mr. DuPuy whose authority to write is based on long study. (p. 15)

---



Blending the qualities of fiction and romance, but dealing with nothing save the facts, the "Romantic Rascal" portrayed this week is Belzoni, the Patagonian Samson. Bookman, monk, juggler, he had a strange career, which shows how different the world was in his days. (p. 16)

---

A Doll Show! Attended by Dolls from all over the world! Big dolls and little dolls, dolls in satin and dolls in rags, all equals in the freedom of Dollville! This occurs in Portland every year. In fact, it has been occurring for the past 23 years. A good idea. (p. 21)

---

The magic of Lake Tahoe compelled Julian Hawthorne to write this article, and as you read it you will see why. Mr. Hawthorne has seen the world, but little to compare with America in scenery. (p. 22)

# Thanksgiving

## *A Footnote to the President's Proclamation*

THINK and *thank*, the great dictionary tells us, grow from the same stem. To think is to thank. The thoughtful are always thankful; ingratitude is an element of thoughtlessness. Even before we knew it of words, we knew this true of life.

I have lived to see a thankful generation give place to a thankless one, and both impress me with their honesty of attitude. The former generation did not pretend to be thankful, nor does the present one, yet the former without pretense was thankful, and this without pretense is not. Their likeness is in their lack of pretense. Their difference can be resolved, not by denouncing it, but by explanation, and fairly to do this we must understand.

This generation is cut off, in its conscious experience, from the sources of its life. Pavements interpose between its feet and the soil; the shelves of grocery stores between its food and the fields; the colossal shelter of cities between its face and the elements, and the fallacies of civilization between its soul and God. Seedtime and harvest pass unheeded; it bows down to laboratories and machines, to banks and warehouses; it worships all *conveyances* of supply as if they were the source, for these are all the source it knows. When, therefore, in a recent year, I saw the President's Proclamation laid aside by one with the remark that *he* knew what *he* had to thank for what *he* had, his own right arm, his industry, his foresight, I took it as an honest act. His thanking went as far as his thinking.

For thankfulness is but the grateful perception of the order of life, appreciation and approval of the preparation—Providence, really—which so amply meets the human need and yet affords such scope for man's-enlargement that never has he even glimpsed the nearer limits.

The Presidential Proclamation recommends giving thanks to Almighty God for the blessings of the year; this is a footnote to that document, directed to those who cannot reach as far as thankfulness, yet able perhaps to attain to thoughtfulness about it all. All that we have is a gift. My friend who thanked his good right arm, his industry and his foresight, will presently see that they are gifts. Our ability to serve multitudes through our industrial civilization is a gift. There is nothing that we have that was not given us. Experience is a gift, and the power that turns it into wisdom and character is also a gift. All this raises thought of a giver.

I think the Giver is so generous that thanks makes no difference to Him, "for He is kind unto the unthankful and the evil," but it may make a difference to us. A gift is giving and receiving, not giving alone. You cannot give your son his opportunity unless he will take it. God himself cannot give me more than I will receive of Him. And receiving has its degrees. Who receives greedily receives much less than one who receives appreciatively. The dinner of herbs eaten with thankfulness is more—even nutritionally—than a banquet with ingratitude. In the end I believe the thankless have really nothing to be thankful for, for as nothing can be owned by whom it is not appreciated, so nothing is really possessed except in thankfulness: Thanks is the final act of appropriation, the seal of ownership.

Beneath our Thanksgiving custom there is, therefore, something very sound. It is not mere form that leads men to thank God. The more thoughtful one grows the more clear it becomes that seen providences, numerous as they are, must be greatly outnumbered by the unperceived providences surrounding our lives. But even when men start with daily bread, the lines run back and back.

Back of the loaf is the snowy flour,
And back of the flour the mill,
And back of the mill
The wheat
And the shower
And the sun
And the Father's will.

# How I Wrote "The Man With the Hoe"

The author of this article, from a photograph made during his recent visit to the new offices of THE DEARBORN INDEPENDENT.

The Hoe-man is not the workman in his best estate: he is the bemoiled toiler in the abyss of civilization

Edwin Markham

By EDWIN MARKHAM

A QUARTER of a century ago *The Man With the Hoe* electrified the world with its music and its meaning, with its passion and its purpose. All tongues seemed to be talking. The London *Critic* said: "No other poem ever swung so swiftly into the mouths of men from sea to sea." Joaquin Miller said: "*The Man With the Hoe* is the whole Yosemite—the thunder, the might, the majesty." Other voices called it "the battle-cry of the next thousand years."

"This Hoe-poem," said the San Francisco *Chronicle*, "attracted more attention than any other poem in the world." For, while it was printed first in San Francisco, it was soon flashing from continent to continent. It has been translated into thirty-seven languages; and experts estimate that it has been printed more than twelve thousand times in newspapers and magazines in all corners of the earth. It has stirred the social dream in millions of souls. Here is Edwin Markham's own story of it:

A man cannot escape from his past.

I am reminded of this fact when from hosts of friends and from thousands of my auditors comes the question: "How did you happen to write *The Man With the Hoe?* Tell us the how, the when, and the why of it." In the main, I have been forced to deny my friends an answer.

But now comes a request from Dearborn, a request that overcomes my inertia, a request that causes me to tell at last the details of the story of these forty-nine lines, which sprang out of my inkwell in the early dawn of the twentieth century.

Why have I been so long reluctant to tell the genesis of this Hoe-poem? First, because I felt the need of finishing new literary projects; and, second, because these reminiscences force me to become my own hero and rehearse my own exploits.

The ground for this poem was doubtless laid in the experiences of my youth, when, as a hard-worked, sunburned boy, I hoed and weeded the orchard and garden from dawn to dusk on my mother's farm and range, in the little Lagoon Valley in the Suisun Hills that spur in the Coast Range of California. A thousand times I have felt the ache in the back and the utter weariness of the long unbroken day's work, with no prospect ahead but another day's work.

But I am not sorry that I learned to work in my youth. It brought me into robust contact with the open air, with soil and sun; and it also gave me a first-hand knowledge of the bread-labor of the world, and a keen sympathy with all toilers.

I feel that it is a misfortune for anyone to grow up in wealth-sheltered homes where they miss this outdoor

experience. Moreover, it seems to me that in a well-ordered world, everyone would be expected to spend a part of his time in bread-labor, and this would make that labor light for all who are engaged in it. Has there ever been offered any good reason for dividing the world into two classes—one class to do all the physical labor and little or none of the thinking, and another class to do all the intellectual labor and little or none of the bodily toil?

Even in my young manhood, these ideas began to take root in my mind. I began to dream of a new world wherein all workers would be thinkers, and all thinkers would be workers. It would be a world based on a union of culture and labor.

Man is a compound of mind and body, and they both should have exercise in order to develop an all-round and healthy personality. The failure of our civilization to carry out this principle leads to innumerable disasters. Our physical workers, performing all the bodily toil, have a tendency toward misshapen bodies and undeveloped minds; while, on the other hand, our mental workers, confining themselves merely to mind labor, have a tendency toward corpulent bodies and nervous disorders.

Big influences were pressing upon my youth in those early days. I not only worked in my mother's orchard and garden, but I also rode my broncho on the tops and slopes of the hills, herding cattle or hunting for them when strayed away in the cañons of far-off ranges. A thousand times I gazed from some hilltop over the Sacramento plains toward the far-off ghostly line of the Sierras.

These vast expanses helped to widen the horizons of my mind. But there was another great influence at work, for in those days I had the happiness to be reading *The Gospel of Jesus*. This is the greatest democratic document in the possession of mankind. It is—when properly interpreted—a daring and powerful demand for the political and industrial liberation of the world.

It was not long before another great democratic document came to my hand to marshal the forces of my young spirit. I refer to a translation of Victor Hugo's romance, *The Man Who Laughs*. Here I came in contact with the soul of Hugo, the chief literary glory of France, a man alive with the glowing enthusiasm of humanity. I was seventeen years old, and all the energies of my mind were bubbling hot in their crater. The huge humanity of Victor Hugo was the fortunate mold into which the fluid emotions ran, cooled, and took form for the labor of a lifetime.

The cry against social injustice, against brutal wrongs, sounding through all this romance, reaches a startling climax in the hour when the young democratic hero of the story stands up in his seat in the Parliament of England and he is asked, "Where do you come from?" and he answers, "From the bottomless pit!" Then begins his terrible arraignment of the men in power, the men who have done nothing or next to nothing for the submerged millions struggling and perishing in the abyss of civilization.

He tells the startled lords of England that they are Privilege—that they should be afraid, for the true master of the house is about to knock at the door. "I come to warn you," he cries. "For myself, I am nothing, save a voice. The human race is a mouth, and I am its cry."

When I wrote *The Man with the Hoe*, I had not seen this awakening romance for years; but the spirit of it was doubtless alive somewhere in "the backward and abysm" of my mind.

Years passed, and I had worked my way out of farm and range, worked my way through two or three colleges. At last, in 1886, I was elected superintendent of schools in El Dorado County, in the beautiful foothills of the Sierras. Here, in 1849, gold was first discovered by James W. Marshall, a man who died in poverty in his little bare cabin at Coloma.

Even in those days, I was a reader and book-buyer (I have now 12,000) and I was still deeply concerned with the problem of the toiling millions. I still had the pain of sympathy in my heart.

I had in my library a volume that widened my knowledge and deepened my compassion. It was *A General Introduction to Social Science*, by Charles Fourier, that extraordinary social philosopher of France, who had won the attention of all forward-looking men in the early half of the nineteenth century.

This volume, packed with new social hopes, had been translated and edited by Albert Brisbane, an impassioned and high-minded reformer of those early days. These hopes of Fourier had gone out as a great tidal wave over the thinking world. Among other effects, this wave stirred the hearts of Nathaniel Hawthorne, Ralph Waldo Emerson, George Ripley, Margaret Fuller, Charles A. Dana; and it led to the organization of a social family known as Brook Farm on the outskirts of Boston. Here men and women of lofty spirit undertook to work together as comrades and to realize a higher life based on the union of labor and culture. For a number of years, this social experiment prospered greatly. Horace Greeley became the impassioned exponent of these new ideas, and opened the columns of his New York *Tribune* to the new social propaganda.

Fourier does not stand on the high idealistic ground occupied by Jesus, yet his criticism of civilization throws a broad light upon the Gospel, and makes it plain that Jesus had in mind the organization of (Continued on page 19)

## "THE MAN WITH THE HOE"

*Written after seeing Millet's world-famous painting.*

God made man in His own image, in the image of God made He him.
—Genesis.

Bowed by the weight of centuries he leans
Upon his hoe and gazes on the ground.
The emptiness of ages in his face,
And on his back the burden of the world.
Who made him dead to rapture and despair,
A thing that grieves not and that never hopes,
Stolid and stunned, a brother to the ox?
Who loosened and let down this brutal jaw?
Whose was the hand that slanted back this brow?
Whose breath blew out the light within this brain?
Is this the Thing the Lord God made and gave
To have dominion over sea and land;
To trace the stars and search the heavens for power;
To feel the passion of Eternity?
Is this the Dream He dreamed who shaped the suns
And marked their ways upon the ancient deep?
Down all the stretch of Hell to its last gulf
There is no shape more terrible than this—
More tongued with censure of the world's blind greed—
More filled with signs and portents for the soul—
More fraught with danger to the universe.

What gulfs between him and the seraphim!
Slave of the wheel of labor, what to him
Are Plato and the swing of Pleiades?
What the long reaches of the peaks of song,
The rift of dawn, the reddening of the rose?
Through this dread shape the suffering ages look;
Time's tragedy is in the aching stoop;
Through this dread shape humanity betrayed,
Plundered, profaned and disinherited,
Cries protest to the Judges of the World,
A protest that is also prophecy.

O masters, lords and rulers in all lands,
Is this the handiwork you give to God,
This monstrous thing distorted and soul-quenched,
How will you ever straighten up this shape;
Touch it again with immortality;
Give back the upward looking and the light;
Rebuild in it the music and the dream;
Make right the immemorial infamies,
Perfidious wrongs, immediacable woes?

O masters, lords and rulers in all lands,
How will the Future reckon with this Man?
How answer his brute question in the hour
When whirlwinds of rebellion shake the world?
How will it be with kingdoms and with kings—
With those who shaped him to the thing he is—
When this dumb Terror shall reply to God
After the silence of the centuries?

# If the Movies Say It Is —It Probably ISN'T

## Just Why Is This So?

By A. R. PINCI

ILLUSTRATED BY W. O. FITZGERALD

WHETHER producers and directors of movies realize it or not, superproductions have really become commonplace. They have run out of plots and of adjectives. On the business side, competition is becoming so keen and even vindictive that the closed corporations of a few years ago have become stock companies which merge and consolidate as a measure of economy. Costs are going up and income has about reached its utmost elasticity. Whether income must snap or rebound is food for thought for even the most opulent cinematographic companies.

In the life of any and every business competition and the apparent stalemate must be faced, and what is done at the moment of crucial discovery will determine the future. It is not too much to say that the motion picture business of the United States is about encountering such a dilemma, all the more difficult because of the nice, secure, single-track padded path it found right along—up to now. It has been easy so far to extract nickels, dimes, quarters and even half-dollars from spectators, but a singsong that is neither melodious nor welcome, but dolorous and unmistakable, is the collective comment of patrons as they file out, whose remarks are overheard by theater owners and managers:

"I liked 'On the Sea by the Rocks' better," the comment goes. "They gave it last year and wasn't much different from this." This, by the way, happens to be entitled "By the Rocks on the Seas." Which is the quickest way to say that plots and titles are beginning to be so much like each other that we can decide on a hunch whether or not a picture is worth seeing. We have learned to discard much of such late entertainment as easily as bank tellers throw out spurious money.

It has been alleged that the phonograph industry broke down because radio defeated it. That is not true at all. Phonographs slumped as soon as the powers that presided over the record departments slumbered serenely on, believing themselves safe in the assurance that a few celebrated artists could be depended on to bring home the bacon. There are certain selections that have been recorded ten or twelve times. Even a music student could be forgiven for not having more than two or at most three of one kind. There are thousands of selections that have never been recorded.

So it is with the movies now. There are plots that are doing double duty right along. There are plots that have never been satisfactorily exploited. Moreover, one successful picture will bring on an avalanche of imitations, not necessarily bad, but which surfeit.

What are the people tired of with respect to the movies?

They are tired of bad stories varnished over by spectacular means; they are tired of the effort to "put over" certain actors and actresses when normally there is nothing for them to do. Finding a story to fit a certain actor and vice versa is one cause of trouble.

They are tired of the insincerity, the infidelity, the grotesqueness that marks most of them in some way. They do not represent life; they represent the personal tastes of the director who happens to be in charge, and even the most capable is so intent usually in putting over the big idea that the substructure of little ideas trails along like so many deformed creatures.

I have made no attempt as to the recurrence of titles and plots and sets. I believe a study of the subject has been made or is under way, which must be a colossal task at that. In most cases as soon as we get a scent of the plot we know how the story will evolve.

For example, if there is a Chinese there must be an opium den or a gang of smugglers.

If there is a cowboy we know that there must be some cattlerustlers with a bad man after the gal.

If there is a Northwest Mounted Police you could bet your last million against any odds that a half-breed is on the rampage and that "Get your man" will never be downed.

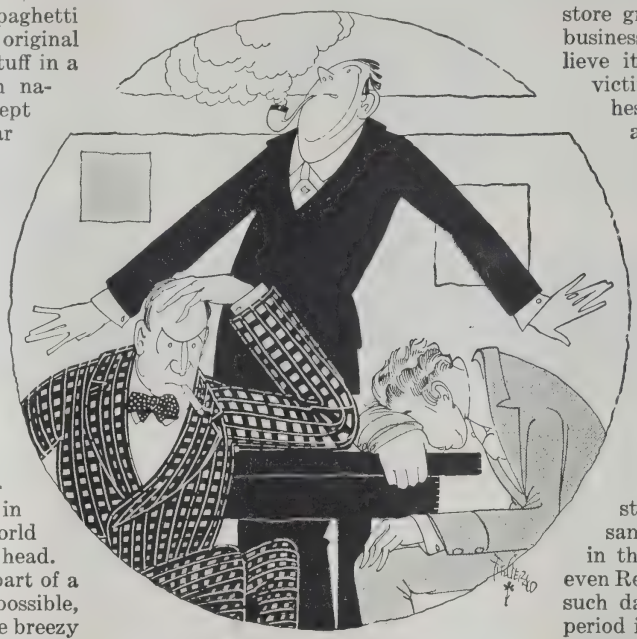
If there is a society man with waxed mustache and hair parted in the middle we are sure that he is trying to confuse Miss Millie's paw-paw by taking his money trickfully so as to compel marriage with a young lady who could shorten the picture in a more convincing way by boxing the villain's ears at the end of the fourth scene, second reel. (In real life she would.)

The appearance of a Japanese may portend two plots: in the case of a valet he is a spy of the Nipponese government; in the case of a master, he is either a prince in disguise or the adult edition of Peck's bad boy, Japanese version, luckily drafted for the American movies.

The Frenchman means some sort of Marsellaise plot or one of those diplomats that never lived except in the movies, occasionally getting us into a

war reminder, just as a doughboy links us with the National Anthem, trenches, smoke pots and more bullets than the war consumed.

No Italian could possibly live in the movies who did not eat spaghetti three times a day using his original Adamitic fork and taking the stuff in a gargling position and no such nationality could be depicted except by garlic garlands hanging near the front door, or he must be some sort of artist whom nature absolutely deprived of speech, judging by gesticulations which I hope some moviedom efficiency engineer ought to utilize for developing horsepower around the studio.



An oversize derby and a cigar planted in the middle of a square face whose mouth always twitches and droops at one corner means a detective who, unlike some legendary beings born with silver spoons in their mouths, came into the world with a hard-boiled hat on his head.

Since even an infinitesimal part of a complete list is physically impossible, I shall close with reference to the breezy young man who confronts us, pencil and memorandum book, y-cleped a newspaper reporter. If the newspapermen who are said to have gravitated to the movies ever reported anything in that fashion then we can absolve moviedom for most of its faults and go after, instead, its employment managers. And, to prove my seriousness, I should appreciate the name and address of every city editor who would approve memorandum books as a legitimate reporting expense. I should like to interview the owner of the newspaper employing both such editor and reporter.

But the point I wish to make is no doubt apparent. You and I, going to the movies, know what to expect in the way of dénouement, and we do not have to read the cast of characters (a useless appendage on the screen) to place most of them. We can't help knowing what they are going to do by their stereotyped appearance.

There is one thing in which apparently all directors seem to excel. That is a desire to confuse us by grandeur that somehow is unsatisfying. They predilect scenes that are supposed to be far, far beyond the ken of ye common peepul, so they relish Monte Carlo, the South Seas, Alaska, Siberia. When they do not feel like wandering so far from home they take two other localities; the ultra-smart-billion-carat set and the ultra-squalid slums, on the assumption that both are equally far from ye common peepul's ken.

The greatest objection to the movies is the conviction, when the screen animates, that the director considers you a most ignorant sort of person who by no means could possibly understand what he is trying to tell you—that is, understand it on your own account, and that his idea of things is paramount. All of us can stand a certain amount of exaggeration, so as to make other

They have run out of plots and adjectives.

limitations a little less obvious, but we draw the line at impossibilities and absurdities.

Who has ever seen a shanghaiing story that was not identical with previous ones? Once in a while I hoped, I earnestly prayed, for a shanghaied hero who would become lame, who would lose his life, and who admitted the impossibility of resisting a score of shanghaiers intent upon keeping him a good boy. I hoped equally often that the "girl" would be delayed by the elements or could lose her way, such has been her inveterate habit of getting into the fray for the sake of being saved.

I do not know who the rope-tying master of the movies is, but one of these days I am going to discover one whose pupils hamstring their victim a little more convincingly than my chain-store grocery boy ties a string at the business end of a broom. I really believe it is time to stop tying movie victims with rope and just use adhesive plaster. It would be novel and not so bulky.

I have not visited the bad frozen Northwest of the goldfields, but I have been in some bad places in my time, and for that reason it would be interesting to know the name of the director who originally fashioned the saloon ladies of either Bloody Gulch or Frozy Pass. Except for the fact that there have been so many of her, and that those I saw ten years ago would be too old now, facial surgery notwithstanding, I could imagine that the same ladies have been doing duty in that rôle all the time. I believe even Rex Beach pictures have portrayed such damosels of the pre-Spanish war period in silk stockings. Can he attest that at that time, somewhere near Nome, young women possessed such wealth in perfect silken stockings that they never appeared without them?

There is a type of story which is flourishing anew these days which I have in mind. The story, in its every portrayal, reveals the same absurdity. It may prove, this, that each story may have been copied from predecessors, but more than likely, since plots are cheap, that directors, lacking knowledge of such matters and being without a mentor who could direct them properly, looked up old pictures and took their cue from those. So here is a case of productions, some quite elaborate, involving a multi-million salary organization, (Concluded on page 28)

There is no doubt that more and more patrons are tiring of the stuff which exceeds cinematographic license.

# Driving the English Language out of the Philippines

By WILLIAM E. BARTON

The Negrito baby is more afraid of the camera than she is of the monkey on her mother's shoulder.

IN THE wake of Dewey's fleet there sailed to the Philippines one of the most interesting expeditions that ever left the shores of the United States. How long we were to keep the Philippines we did not know, but so long as we retained them, we intended to do as much as possible of our communication in some other language than the Spanish. By unprecedented measures, the Government of the United States undertook to transport to the Philippines a thousand schoolteachers before the end of 1901. The undertaking was surprisingly successful. In 1904 there was an enrollment in the public schools of 280,414 pupils. The educational force was 4,207, composed of 787 Americans and 3,414 native teachers. Now, in 1925, the end has nearly been attained of providing school facilities for every boy and girl in the Islands. The Vice-Governor of the Islands, appointed by the President of the United States, is the Commissioner of Education and also of Public Health, and the results of this double arrangement are worthy of all praise. Manila is one of the healthiest cities in the world, and the system of education appears, in spite of the limitations which I shall presently indicate, to have accomplished wonders.

More persons in the Philippines now use the English tongue than ever used the Spanish.

Please consider for a moment what that means. The United States has accomplished more in twenty-five years in the way of approach toward a universal language in the Philippines than Spain did in three hundred years. Those eight hundred American schoolteachers did not live and work in vain, and their successors have not wrought without result.

There are 49 provincial school divisions, each with its own director. There are 50 provincial high schools. There are normal schools and vocational schools of marked efficiency—the Board of Education receives $150,000 a year from the United States for the products of the vocational schools of the Philippines. There are 4,000 school gardens and 100,000 home gardens, a result of the economic stress of the World War. There is a university with an enrollment of more than 5,000, with courses in arts, science, education, medicine, law, engineering, forestry, music and other departments. The campus is finely located and has 45 permanent buildings.

In all this system of education, English is the language employed.

Please read that sentence again. When I was in Bilibid Prison I noticed that the women prisoners were learning not simply to make embroidery, a remunerative vocation, but were learning from charts to read in English, not in Spanish or any native dialect.

The purpose of this present article is not only to record this remarkable achievement, but also to say something of *a movement now under way, and gaining strong support not only in the Philippines but in influential quarters in America, to limit if not to overthrow this system of enlightenment.*

The literature of this movement is being sent to America by distinguished advocates of the idea, and the names of American scholars who approve, or appear to approve, the thesis are given glad publicity.

Since 1916, when President Wilson set out to Filipinize the entire government of the Islands with a view to speedy recognition of their independence, the American element in education has greatly shrunk. There are now only 330 American teachers as against 24,732 Filipino teachers. The school enrollment has increased from 280,000 in 1904 to 1,132,719 in 1923.

Of the Filipino teachers, 246 are college graduates, 3,411 are graduates of high or normal schools, and 20,475 are below the grade of high school graduation, about half of them having had no high school or normal training.

And they are all required to teach in English!

(*Concluded on page 29*)

# Copp's Hill, Where Heroes Rest

## Boston's Historic Necropolis

By May B. Whiting

THE cemetery always used to be regarded as a delightful place in which to spend a Sunday afternoon, and that idea is not so strange considering the sort of burying grounds that fostered it. For in those days there were no mere monuments with names and dates and platitudes, but dreadful sculptured faces to stir the imagination, and intimate lines that gave an inkling of the whole family history, even to the skeleton in the closet. When the movies were not dreamed of and the theater was a crime, the pious Sunday visitor could evolve in fancy a whole drama, say, "The Follies of 1695," with the epitaphs as a theme.

Copp's Hill Burying Ground in Boston is rarely situated on an eminence overlooking Charles River as it enters the harbor. At the foot of the hill Winthrop and his company first landed, coming over from Charlestown to avoid the mists from the lowlands, and on its crown they placed their windmill. For years the place was known as Windmill Field, and for two centuries it was a recreation center for the north end of the town as the Common was for the south end. To celebrate the surrender of Quebec "forty-five tar barrels, two cords of wood, a mast, a spar, and boards, with fifty pounds of powder" were set off, and, that there might be nothing lacking, the colony at the same time provided "32 gallons of rum and much beer." A pirate was once executed on the top of the hill, and, on this joyous occasion, the river was crowded with small craft filled with spectators.

In 1659 William Copp conveyed a parcel of land for a burying ground. This Copp was a shoemaker, or cordwainer, as they were called, and, besides his trade, he made a pretty penny investing in land. At one time he was fined for concealing money. Samuel Sewall, a few years later, sold to the town the adjoining field which he inherited from his wife, Hannah, daughter of the mint master who put the pine tree, instead of the English oak, upon the shillings. The land for a street was given on condition that it bear the name Hull "forever."

Parallel to Hull, bordering the burying ground on the east, is Charter street, named in honor of Governor Phipps whose mansion house was at its lower end, facing the water. Phipps was a ship carpenter in his youth and then became master of a vessel. On one of his voyages he learned the whereabouts of a sunken Spanish treasure ship, raised it and carried the booty to England, where he was knighted for his pains. This bold exploit pleased Andros, soldier of fortune himself, and he made him high sheriff, although at that time he knew nothing of law and could hardly write. When the new charter was granted, through the labors of Increase Mather, Phipps brought it to America and became first royal governor under it. He was a true friend of the Colonies and would have been a good governor if he had ever learned to control a fiery temper.

The Phipps mansion became the property of Captain Gruchy, a privateer, who built a tunnel from it to the water's edge. The night one

# MR. FORD'S PAGE

THE emphasis given to wages in all discussions of economic welfare may seem somewhat extravagant at times, and certainly is proved to be extravagant when taken up and forced to strong conclusions without reference to parallel considerations of equal importance.

Thus, in the face of a class that regards wages as an element to be fought down as much as possible, it is necessary to insist on the fact that wages furnish purchasing power and the whole process of business depends on people who are able to buy and pay. It is necessary to insist that an attack on wages is an attack on the very foundations of that adequate production and exchange of supplies which is necessary to social life.

On the other hand, when special pleaders begin to declare that wages should absorb all the economies, all the increased profits made possible by industrial improvements, it becomes necessary to call attention to the essential class-nature and limited benefits of such a view.

As this view has again been lately asserted under very respectable auspices, it may be stated again. It is proposed that henceforth all the advantages accruing from better management such as increased production, lower costs, higher values, should be made over to wages.

That this is a most narrow, anti-social and unfair position needs only be stated to be seen. Take the case of one factory. It was built on one man's idea of a certain service which society needed and which up to that time had been only crudely met. Society responded, giving large patronage to the factory, which was thereby not only enabled to grow but to make still further improvements in the service which it rendered. Not the least of these improvements were internal, that is they occurred within the management of the business, the laying out of the work, the simplifying of the method, the saving of useless labor and wasted material, all of which permitted the service to be rendered at less cost than formerly.

Now, there were three ways this decreased cost, which was really increased profit, could go. The manager could say, "I will keep it all, because it was my ability that made this saving possible." Or he could say, "I will take this difference between what the article used to cost and what it costs now, and put it into the wage envelopes of the men." Or he could say, "It costs less to produce this service, therefore the selling price ought to be reduced an equal amount, and the buyer given the benefit."

In the first instance the argument could well have been: the extra profit belongs to the man whose brains made it possible. In the second instance, the argument could have been: the extra profits belong to the workers, the producers. In the third instance the argument could have been: the buying public has the right to necessities and service at the lowest possible cost.

*WHEN improved methods and better management make possible lower production costs, who should reap the advantage? Should the increased profits go to the capital end of the business, or to the labor end of the business, or to the public that buys the manufactured commodity? Each of these is a claimant. But it is only necessary to trace the possible effects of such a course to see how faulty it is. Just now the demand is being made that all the economies of business be used to increase wages. Why only wages? Why not also to decrease prices?*

The first attitude represents the extreme of the short-sighted capitalistic philosophy which ruled a generation ago, and which is swiftly passing. It is doubtless true that improvements in methods of production which have greatly reduced the costs of living have been the result of managerial brains. But managerial brains are rarely if ever capitalistic. If capitalism had the faculty of management it would thereby cease to be capitalism and would become productionism. The improvements of production did not come from the class that loaned the money, but from the men who actually put their brains to work in the industry.

These, if any, are surely a part of labor. They are a part of labor which is often lost sight of. If it were proposed to distinguish between the forms of labor, that which contributes brawn and that which contributes brain, the distinction being made in order to discriminate in the latter's favor, there would doubtless be some opposition. Yet under the arguments assumed above this is what should be done. "The men who contribute the ideas that decrease the cost of production should reap the additional profit"—how would that sound? Why, labor itself would repudiate the idea.

Yet that is what has been seriously proposed of late with reference to the other part of labor which did not contribute to the idea at all, but only to the lesser parts of the scheme. Whether this proposal has elements of common sense is a question about which no doubt exists. We shall state the case next week, in the hope that it may serve to clarify labor's thought in the matter.

## The Plight of the Parties

IS IT the "party" or the "organization"? The party is the rank and file of the people committed to a specific view of political problems and to a specific program of political action. The organization is the group at the top which attempts to swing the party this way or that, does the "trading," the tricks, the sordid diplomacy of place and prominence. It is the organization that kills the party. The party is natural, useful, inevitable. The organization is usually a cancer of narrow selfishness which grows upon the party.

In no surer way does the organization weaken and destroy the party than by forgetting that one of the functions of a party is to nourish future statesmen. Time was when parties looked over the ranks of their young men and saw governors, presidents and diplomats coming to the front. The party was the seed-plot of public service. That seems to have been changed. Organizations resent young "comers." They drive out ability. They discourage political enterprise. They are not training up young men to take their jobs, as all good business men do.

The natural result is that when parties today look through their ranks for candidate material, they find little or none. Take the plight of the Democratic party today. Not many years ago Democracy bristled with young men coming to the top, displaying fine mettle, acquiring ability. Today Democracy casts its eye hopelessly around to find a man to carry the banner. It is compelled by the very scarcity of men to take second-grade material, which the nation instinctively rejects.

Not only is this bad for the Democrats, it is bad for the Republicans, for it permits Republicans to go into elections with less than the best candidatorial timber. The excellence of one party personnel compels an equal or greater excellence to be displayed in the personnel of the opposite party. But this cannot be done when parties degenerate into organizations and when national elections become mere contests between two groups of politicians at the top. It is time for parties to inquire what the "organization" has done to them.

## Suppressing Facts in Boston

MAYBE it is not always wise to tell the facts. If police have laid a plan to trap a criminal, newspapers ought not to advertise the criminal of the fact—though they often do. But if a condition exists which is dangerous to the people, it ought to be advertised—but it frequently is not. We all know how careful newspapers are not to print anything that would be likely to offend theaters or stores.

An extreme instance, however, is taken from *Editor and Publisher* which in turn quotes from the Springfield (Mass.) *Republican*, as follows:

> "One of the most amazing instances of news suppression that has ever occurred in Boston came to light this week, with the detention of the man who for more than 10 weeks has been throwing missiles in a crowded Boston theater, and at practically every performance. For more than a month the facts have been common knowledge in every Boston newspaper office, yet not a single paper had the courage to print the facts. Instead, innocent persons were permitted to attend every performance, with the practical certainty that a deadly missile would be thrown and the probability that some one would be hit. Many, in fact, have been hit, but happily none of the missiles has reached a vital spot, although several women have suffered painful injuries to their limbs. Some of the missiles were sharp pieces of steel, others were comparatively heavy junks of iron or lead. That no more serious injuries resulted is little short of miraculous."

As an illustration of the extreme to which these things can go, this instance is worth recording.

## In 1987—What?

THE strategy of publicity seems to follow that of war, with equally bad results. It is now accepted as true that kings, when dissension affected the nation, often created a diversion in the form of foreign war. The European press and politicians seem to be using the American attitude on war debts to divert attention from Europe's internal troubles. *The war debts are not one of those troubles*, since they are not being paid. The Americans are asking only an understanding, an arrangement; why this should be made the ground for a campaign of hate against this country, is not plain to reason. The consequences of the state of mind which Europe is now stirring up may be more than French and English press and politicians are bargaining for.

It should be made clear, however, that the people of the United States are still thinking about the war debts. We are not at all impervious to the argument that Europe's men against our money represents the greater loss; we recognize that, because we lost men also. All we say is that to offer the solution of money versus men for our consideration is very unwisely done. It represents a form of thinking which gives us an uneasy sense of shame for those who use it. Yet, we recognize the poignancy of its fundamental truth.

We also recognize that the situation in Europe just now is such that it is better for her to figure on paying debts than on making war. If it is a question of millions going into munitions, or millions going into debt payments, we think it is for the good of the world that we insist on payments first.

But as yet it is only suggestion; it has hardly reached the stage of collection. And it is principally a present policy. No one knows what it will be a few years hence. Some of the arrangements that have been made run for 62 years. Many things will occur in the world before 1987. Think what occurred between 1825 and 1887; the record will be stupendous between 1925 and 1987. And different conditions will bring about different policies, no doubt of that. Our sons, to whom these debts will run, and Europe's sons to whom the responsibility for them will run, will both have new points of view, new problems. In 62 years such events may have occurred in Europe as to leave forever uncollectable all such debts. Such events may have occurred as would leave America in a position to take other attitudes. We do not know. Few of us ever expect Europe to pay. Europe herself has little notion of paying. If the present American attitude serves Europe by making debt embarrassment a hindrance to more war, America should be thanked, not hated. Anti-American propaganda in Europe is very dangerous to Europe—fortunately it does not touch us and would make no difference to us, but it is hurting Europe. It is creating a state of mind which must bring damaging reactions.

It is the wisdom of statesmen in Europe and America to say frankly whether the business attitude toward the war debts is not the best attitude to take in the present circumstances. As to 1987, that is two generations of leaders away. Other men, other times, other policies. These matters usually come out right in the end.

## *A Sound Conviction*

DELEGATE McCullough, of Omaha, in the discussion of the Campaign for the so-called Child Labor Amendment to the Federal Constitution, at the last meeting of the American Federation of Labor, told the advocates of the measure they had made the mistake of opposing the common people, and that they must educate the common people and secure their support before the effort to sew another patch on the Constitution could succeed. *The Presbyterian* read the same thing, and thus comments on the delegate's words:

> "Mr. McCullough is right. It was the common people who defeated the attempt to take from the family and the State the control of the youth of the nation up to the age of 18, and center it in a Washington bureaucracy. And it will take a lot of educating to make them change their minds."

*The Presbyterian* adds a straightforward declaration of its own position thus tersely:

> "The attempt to destroy the family by robbing it of divinely appointed rights, powers and functions and to make the state all-inclusive in its powers over the child, is anarchy in its worst form, and it cannot live inside or near to a republic."

That is the common mind of the common people on this question. Is there any likelihood of "educating" them out of that?

## *Failure of State Farming*

A STATEMENT, specially interesting because of its frankness, has just been issued by a select committee appointed by the British Ministry of Agriculture to inquire into the question of state farming. Under the Agricultural Act of 1919, the British Ministry of Agriculture was empowered to engage in "direct farming operations," and has had under its control, for several years, farm lands in Yorkshire and elsewhere. The scheme has been developed on a profit-sharing basis, but, so far, there have been no profits to share. On the contrary, "financial losses have been considerable," and the committee frankly declares that the country ought to realize the cost to the taxpayers by which the scheme is maintained.

True, the committee declares that "apart from the cost of it, the experiment has been a very successful piece of work as an instance of practical land settlement"; and it goes on to record the fact that there is "a very much larger population on the land than ever was employed before, living in good conditions, in decent houses, and with decent wages." But then it is always possible to secure all of these if money is no consideration. Such conditions, however, should be secured and can be secured while maintaining the industry concerned on a paying basis.

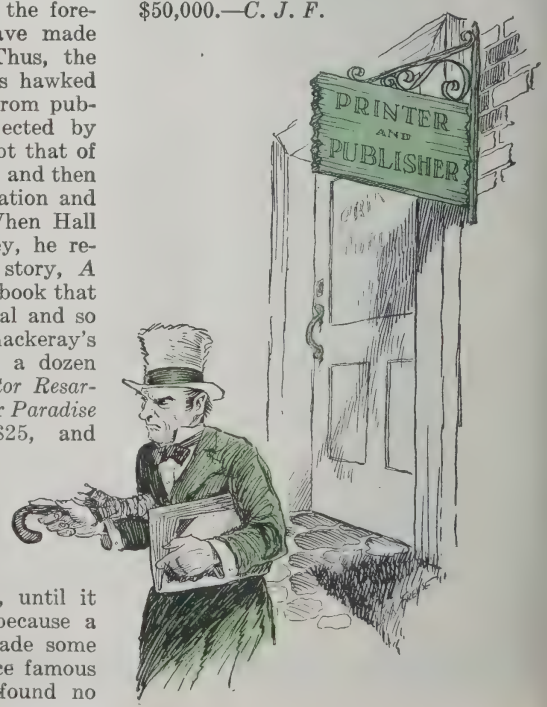
***The Man from New York*** came into The Office and told how Will Hays was being defeated all down the line in his fight for the motion picture producers. This man thought it significant that the Presbyterian church turned down Will Hays' plea and stood out for control, and that even the old ministers were firm notwithstanding the fact that Will Hays is chairman of the Ministerial Sustentation Committee which provides the living of worn-out ministers. The censorship in New York, this gentleman told me, was working well. Its services are not to be measured merely by the number of films totally rejected, nor the number of excisions made, but also by the number of immoral films that never attempt to show in the state because of the law. The New York motion picture censorship is not only self-supporting, but turns in a profit to the state.

Connecticut, also, this gentleman tells me, has passed a movie licensing law, providing for a $10 tax on each film shown in the state, and which enables the tax commissioner to revoke the license on any immoral film. Will Hays was actively engaged against that law also. Mr. Wickersham was one of the movie men's attorneys. I understand that the day was saved by the work of an Episcopalian clergyman, who offered to act as "friend of the court" to bring to light certain facts which he felt were not being sufficiently emphasized by the attorney for the state. So Connecticut lines up also.

Most of the things said against a censorship can probably be substantiated on the ground of pure art, but when it is a condition that confronts us rather than a theory, a condition of sordid exploitation of immoral pictures among the public, the American mind simply seeks to stamp it out. There is, after all, no difference between the purveyor of pornographic post cards and the purveyor of pornographic plays and motion pictures. We have police for the one, and who in the name of decency are the others that they should go free!

***The Man from England*** dropped into The Office and said that, from his point of view, England was in for a severe trial. "Not only are one and a quarter million men out of work, but much of the work now being done is slowly being crowded out. When the United States can sell steel in Birmingham cheaper than the English can make it there, it doesn't promise well for English industry. The whole country is astounded to learn that the greater the improvements in coal-mining methods and the greater the wages paid, the less coal is mined. Eighty per cent of England's population is made up of laboring people. Her normal unemployed is half a million. The greatest nation in the world treats its laboring people in a way hard to understand, and I feel that the retribution will be very severe. The English monied class are not 'good sports' when it comes to dealing with their own kindred in the factories."

***The Man from China*** dropped into The Office and said that China was on the move now and no one need expect her to slacken. He predicted that the nations would have to adopt another attitude toward the Chinese. Nothing was more absurd anyway than that the Western nations should assume that the Chinese were barbarous—they have an ancient civilization and an established character based on racial, religious and intellectual foundations. The Western nations will have to back down from their position—no doubt about that—and afterward they will find the Chinese good friends.



Our Caller said that Russia had a finger in the pie, but that there was no more chance for the Chinese going Bolshevik than for the Nordic American. Chinese just naturally have too much sense; they are too highly educated; their philosophy is too ancient and strong. Russia is trying to capitalize the present situation by subsidizing the noisier students. The method of the outbreak was not Chinese at all; when Russian gold ceases, disorder will cease, but that will not affect the issue in the least.

"There are more than 435,000,000 Chinese in China," said he, "and only about 325,000 foreigners. Of these about 25,000 are British and American. There are 85,000 Russians and more than 200,000 Japanese. So, you see, the 25,000 are really the center of the trouble, or more especially the 15,000 who are British. One trouble is that, copying the errors of the West, China thinks—that is, Young China—that something can be accomplished by 'hurrah.' But that is not Chinese. The lack is of a Central Government. It is impossible for Western peoples to conceive how smoothly China gets along without a Central Government.

"Where Western nations have failed is in exploiting China, instead of helping her. If we help her now, she will be grateful."

## Successful Books That Were Scorned

PUBLISHERS whose interests lie in the production of books calculated to make successful appeals to popular caprice are no new phenomena. But, aiming at money-making as the foremost consideration, they have made sad errors of judgment. Thus, the fine story, *Lorna Doone*, was hawked about by R. D. Blackmore from publisher to publisher, and rejected by every publisher's reader except that of Sampson, Low and Company, and then was brought out with trepidation and a paucity of advertising. When Hall Caine was reader for Bentley, he rejected Marie Corelli's first story, *A Romance of Two Worlds*, as a book that would have no popular appeal and so mean financial disaster. Thackeray's *Vanity Fair* was refused by a dozen publishers and Carlyle's *Sartor Resartus* had no better fortune. For *Paradise Lost* Milton was paid $25, and Goldsmith sold his classic *Vicar of Wakefield* for $350, given as a special favor. No one would bring out *Uncle Tom's Cabin*, and Fielding's *Tom Jones* was rejected time and time again, until it was brought out in 1749, because a slight play by its author made some noise in the world. The once famous *Mr. Barnes of New York* found no publisher, so Archibald Clavering Gunter brought it out at his own expense, spending $925 on the venture. In less than a year he had cleared $50,000.—*C. J. F.*

# What Would You Rather Do Than Work?

## The Great Problem of the Future Will Be How to Loaf Harmlessly

By ALLAN L. BENSON

PERHAPS you were born too soon. One never can tell. At any rate, it may interest you to know that the great problem of the next hundred years or so is going to be to learn how to do a scientific, non-skidding, pleasurable and harmless job of loafing. Loafing is by no means the right word, but it is the word that will be best understood today. Life with little labor is what is meant—life with a great deal of time to spend in doing whatever one wants to do.

It sounds easy and delightful, and it will be when we learn how to do it, but until we do, this kind of existence will probably be productive of more heartaches than any other problem that we have ever tried to solve. Any fool can work, but it takes not only a wise but an experienced person to use sensibly and enjoyably a considerable amount of spare time.

The human race is recapturing its leisure. It once had leisure and lost it but it is getting it back again. The discovery of how to make fire was what first set us to work because it enabled us to live farther from the Equator where food produced itself and clothing and shelter were unnecessary. People moved away from the Equator, not because they preferred cold and work to heat and idleness, but because the colder climes offered them a refuge in the struggle for existence. As Mr. Malthus told us long ago, the growing of two blades of grass where but one grew before always has a tendency to cause two children to be born where but one was born before. Malthus did not use these words, but that is what he meant. Population always tends to press to the limit upon subsistence. Fire made it possible for more people to live upon the earth provided they would forego some of their leisure.

The process of working like the mischief for a bare living is what the world has long called, and still calls, a distinguishing mark of civilization. This process reached its climax in England about a hundred years ago. It was then that leisure reached its lowest level. England had led the world in the adoption of the factory system of production. She had no competitors, the world was her market, and there was a demand for all the manufactured goods she could produce.

English manufacturers put on every bit of driving power they could muster. Adults were required to work sixteen hours a day. In the textile industries, children were employed, nights as well as days, some of the children no more than five years old, and when the tots fell asleep at their work, men hired for the purpose gently shook them until they awakened.

In the United States, fifty years ago, eleven and twelve hour days were the rule in industry. Workingmen then talked of the ten-hour day as workingmen now talk of the five-hour day. American industry is now mostly on an eight-hour basis, while here and there a trade works six hours and talks of five. And in England, the workday of a coal miner is fixed by law at seven hours.

The human race is recapturing its leisure. Mechanical power and machinery have so increased the productivity of the worker that it is not necessary for him to work so many hours to produce all of the commodities that the market can consume. Of course, the story is not quite so short as that. Workingmen have pressed and are still pressing for shorter hours. The resistance of labor and the increased productivity of power and machinery have worked hand in hand to shorten the workday.

Nor is the workday yet as short as it will be. We have only just begun to use power. We have only just begun to use machinery. We have only just begun to take the lost motion out of manufacturing processes. We have only just begun to use automatic machinery. As we employ more power and learn better how to do things, the workday will become shorter and shorter.

We are recapturing our leisure. Here in the United States, during the last fifty years, we have added four or five hours a day to the time that we may have to ourselves. The problem of what to do with our leisure is therefore a present one. It is not a problem with which only our grandchildren will have to deal. It is already our problem, too. We may not recognize it, but such is the fact.

What are we doing with the leisure that has come to us? We may be doing a little better than the savage when he wants to dress up and considers himself ready for a party when he puts on a plug hat and knots a tie around his bare neck; but we are making considerable of a mess of it. Nothing is apparently more difficult for hard-worked men and women than agreeably to dispose of some spare time. I recall the days of my youth when I was a newspaper worker. The last day before a reporter was to begin a week's vacation he was full of glee. Possibly Monday would pass without a sight of him. No later than Tuesday afternoon, he would amble into the office smoking a big cigar, the complete personification of wealth and leisure. Going from desk to desk he would offer sympathy to the downtrodden slaves who had to

work for a living. The next afternoon he would come back and do the same thing. I have seen them drop into the office every afternoon of their brief week's vacation, for the very good reason that they knew nothing else to do. They had been used to hard work and could not suddenly turn a corner.

We are all of us about the same. It is difficult enough to know what to do with a week, but when all of the workdays are cut from sixteen hours to seven or eight we have, whether we know it or not, a real problem. As a race, we have had to work so hard since we left the tropics that we have had little occasion to consider how we might most enjoyably spend our spare time. Much if not most of the opposition to prohibition is due to the fact that man has developed so few of his capacities for happiness. One hears nothing else in New York except that the town has gone to—well, let us not say where—and that there is nothing to do! There are a great many explanations of the drink habit, but the best explanation of all is that people drink because they have time to spare, crave recreation, and believe they know of no other way to enjoy their time.

*Crimes Committed on Behalf of a Thirst*

There is probably not a human being in the world who, if he knew how to handle himself, could not do many things, each of which would yield him more pleasure than he could get from drinking. But how many know how to handle themselves? This writer will frankly say that he himself does not. He once drank some, he now drinks none, because he does not believe in violating the law, he does not care to take the moral responsibility that comes from indirectly employing bootleggers to commit crimes in behalf of his thirst, and if he contemplated suicide he would know better means to accomplish his purpose than to drink the stuff that is now peddled.

I have suddenly drifted into my own attempts to solve the leisure problem for myself because, for twenty years or so, I have had more leisure than most persons have had. In a way I have, and in another way I have not. Subconsciously my work is probably always in my mind, and consciously it is there a great deal of the time when others would not consider that I was working. But I have had enough leisure so that I should know a good deal about what to do with it. And I very frankly confess that I know very little. One can read, yes; but what is reading in comparison with the direct human touch? A very poor substitute, indeed.

Why not have the real thing, real contacts with human minds—friends? Try to get them. Acquaintances may be had for the asking, but friends are all but impossible to obtain. The young, having many acquaintances, think they have many friends, but they are lucky if they have any. An acquaintance may be here today and there tomorrow, but one never wants a friend to go away. Yet what is a friend but an acquaintance who has proved worth while? That is exactly what he is. Are most persons not worth while? Probably everybody is worth while to one or more persons.

*Why Not Organize the World for Friendship?*

Why isn't the world organized for friendship? It is organized for almost everything else. It is organized for religion, business, science and many other things. There have even been some small attempts to organize it for friendship. Clubs are partly for this purpose, but in a sea of loneliness, a club is smaller than a tomato can adrift in the Atlantic Ocean. One can be more lonesome in a great city than anywhere else because he is so completely shut out. He is surrounded by everybody and acquainted with nobody. He passes clubs but he does not belong. If he joins one he may soon find he does not want to belong. It sometimes seems as if there are more boobs in clubs than anywhere else. That is because the experimenter has not yet found his own kind of boobs. It takes so long to comb a city for one's own kind. Life is too short. The only chance is to blunder into the right place very early in the game. I have done this once or twice in my life, but usually the place burned up or something happened to destroy it. I recall an exceedingly interesting luncheon club in New York that was wrecked by the war. Too much argument, too much bitterness; it was easier to scuttle it than to try to calm it.

What is one to do with his spare time? One may say that he can go home. Home is a great institution, but it can be overdone. Home would oftentimes be more popular if it were not patronized so much. Home is a place to which to return, but it is also a place from which to get away. One is likely to value his home more highly if he does not see too much of it. This goes for women as well as men. Home, carried to an extreme, becomes but another word for monotony. We all know what happened to the man who wagered that he could eat a quail a day for thirty days. Human nature rebels against nothing more than lack of variety. That is why we have so hard a time in disposing of the leisure that we are recapturing. We do not know enough ways to spend it.

*There Must Be No Turning Back*

We shall have more and better ways when we have had leisure longer. That the most experienced have learned so little about what to do with their time shows how difficult is the problem that we are now called upon to solve. If twenty years were enough to solve it, it would not be much of a problem. Centuries were required to train men to work sixteen hours a day. A century or two may elapse before we learn how to spend our spare time happily and wisely.

There will be no turning back. The world will never return to the sixteen-hour workday. Nor can the individual solve the problem for himself by devoting himself wholly to work. To do so would be merely to admit that the problem had beaten him and driven him back upon his ancestors.

Nor is it desirable that the world should turn back. There is no virtue in work, as such. Work is but a means to an end. We work that we may live afterward. Our predicament lies in the fact that we have worked so much that we have not found out how to live afterward. We have not found out how to entertain ourselves.

How can we be entertained? What have we to please? We have our physical senses. We have our minds. Gratification of the physical senses offers no solution, otherwise the problem would long have been solved. Our only unexplored possibility is the mind. From the little that we know of it, its possibilities for giving us enjoyment are infinite. The mind can derive pleasure from the study of a flower seed or a star, but it is perhaps most agreeably engaged when it is in direct contact with other minds. I think the happiest men I have ever known were those who had most developed the art of making friends and talking just enough to keep the other fellows showing off the best they had in their mental warehouses.

*"When Everybody Has His Own Airplane*

What one does for the pure enjoyment of it is still play even though he do it for wages. The creative instinct takes pay because it cannot live without it, but it would operate without cash if it could. Probably everybody has this instinct more or less. We shall never have so much leisure that we shall not want to do anything. But we shall do more things for the pleasure of doing them.

It is a very fine thing for the world that a good deal of leisure has already come to it and that more is coming. But it will have to pay a big price for what it gets. The poverty problem which is now on the way to solution was and is very little in comparison with the problem of what to do to keep from being bored stiff. The best hope that I can think of, for the moment, is that the time will soon come when everybody can have his own airplane and make the grand tour of the world for about eleven dollars' worth of gasoline. We should probably eventually tire of so much scenery, but at the end of each trip it would be so fine to go home, plant flowers, trim the rose bushes and at night do a little fishing on the radio.

As we learn how to use leisure life is bound to become more and more worth while. Our golden age is just beginning.

# This Country Has Money to Burn

## Millions Worth of National-Bank Notes End Their Career in the Incinerator

By WILLIAM ATHERTON DU PUY

THE Federal Government has just snuffed out the lives of $118,000,000 worth of national-bank notes, a currency which the people has carried more consistently in its pockets since the Civil War than any other.

This act calls to mind the fact that national-bank notes are scheduled for retirement, are to go for good as an element of the currency if the policy of Secretary Mellon is continued. It means that a piece of old financial machinery is to be scrapped in the face of the development of something new and better.

*Resolved That Bond-Secured Currency Should Go*

The people, all of whom have used national-bank notes all their lives, will probably never miss them. It is an odd fact in the United States that the users of money seldom come to know much about what it is like. They do not so much as know that they are constantly using no less than five types of paper money. The national-bank note is one of these types. If the program for its retirement is carried out there will be four types of paper currency in circulation instead of five.

It was the intent of the Federal Reserve Act of 1913 that national-bank notes should go. Two smaller blocks of the Government bonds on which they could be issued had previously been withdrawn. Secretary Mellon says: "The importance of simplifying our currency system by the elimination of the national bank note is paramount . . . A way should be provided for the gradual elimination of the bond-secured currency issued by the several thousand different national banks."

The individual who has occasionally stopped to examine his paper money has found that some of it carries the legend, "The Blank National Bank will pay to bearer on demand." That is national-bank money. About one-eighth of the paper money is at present of that type. In 1914 one-fourth of it was national-bank notes. In 1880 one-half of it was national-bank notes. Back of that, all the way to the Civil War, it was the only paper money besides the war-time "greenbacks."

*A System Which Has Served Its Purpose*

National-bank notes are, obviously, a historic element in the monetary structure of the nation. Steps toward their retirement means the removal of a currency which, prior to the introduction of Federal-reserve notes, stood out in impressive prominence.

This type of paper money was almost the first Federal paper money to be issued. The "greenbacks" had previously come out and both issues had grown out of the Civil War.

Near the close of the Civil War, the Treasury had needed two things—currency for circulation, and a market for its bonds. Out of these needs had grown the national-bank idea. Banks wanted the privilege of issuing paper money. They were allowed to do so under certain conditions. They must buy specified Government bonds and deposit them with the Treasury to guarantee the redemption of the paper money they were permitted to issue.

It was out of this Civil War idea that the national-bank system grew. It served its end. It created a market for Government bonds. Before the war the only paper money was that issued by state banks. The government had nothing to do with it. It was not satisfactory. To support the national-bank scheme the government taxed the state-bank issues out of existence.

And these other types of paper money that the citizen is likely to find in his roll! How do you suppose they came about?

*Gold Certificates Have Become Richest Element*

Well, there are the Civil War "greenbacks" already mentioned. They are still in circulation. They are an obligation of the Civil War that has never been paid. They are now called United States notes. They are a distinct type of paper money. They can be told from the others because they alone bear a red seal on their faces. Instead of retiring them, Congress provided that, whenever one of them came in for redemption, a new note should be put out in its place. Thus have $346,000,000 worth of them been kept going ever since. Thus were the people given a second type of paper currency.

The Civil War period, in fact, seems to have been an outstanding germinating period for currencies. Another of our types of paper money, gold certificates, started in the sixties. It was then provided that whosoever had gold and wished to exchange it for paper money had but to bring it to the Treasury where he would be given gold certificates. This is the yellow-backed paper frequently met today. Some gold certificates were issued from 1866 on, but the bulk of them was not great until the world's outpouring gold began piling up abundant stocks of it at about the beginning of the present century. What with the flood of gold from Europe resulting from the war, gold certificates have become the richest element in the currency, next to that baby of the group, the Federal-reserve note.

Then there is the silver certificate. Most of the one-dollar bills are of this breed. It came about because silver dollars were over heavy in the public pocket. Instead of carrying silver dollars the public deposits them and takes silver certificates as warehouse receipts. These slips of paper certify that there has been deposited in the Treasury of the United States of America one silver dollar payable to the bearer on demand. This type of currency has a blue seal on its face where the United States notes have a red seal. The dollar bills carry the face of Washington. Thus they add another currency to the list.

*National-Bank Notes Are Most Confusing*

Finally Congress provided for Federal-reserve currency. This was a thought-out money. It had one quality that was lacking in the others. It automatically adjusted itself to the need. When there was a boom and much money was needed, it poured forth. When times were slack, it contracted. The time may come when it will replace all the others. It may be the sole paper money of the next generation.

The national-bank notes are the most confusing of all because there are about 8,000 banks issuing them, no two alike. Their manufacture is the great problem at the Bureau of Engraving and Printing, as no less than one hundred orders from the banks come in each day. These orders are small job lots in printing. The bureau must keep separate plates for each bank, must get out those plates, make ready on the presses, run a few thousand, and quit. It is quite different on the silver certificates, for instance, that are printed in the hundreds of millions, all just alike. Here plates may be put on the press and run, without a change of program, until they wear out.

*May Be 1930 Before All Are Gone*

The last of the national-bank notes cannot be retired until 1930. The reason for this is the fact that the government has sold the banks certain bonds, known as two per cent consuls, that do not mature until that date. It sold them, agreeing that they should have the currency privilege. The national banks bought them. So the government has got to keep about $600,000,000 in national-bank notes in circulation until that date.

Of course it is by no means certain that this type of currency will be entirely removed from the field. It is Mr. Mellon's policy to remove it. He will probably not be in office in 1930, however, and another Secretary and other Congresses may have different views.

# Romantic Rascals

## Belzoni, the Patagonian Samson
## 1815-1823

(Twelfth of Series)

By CHARLES J. FINGER

WOOD BLOCKS CUT BY PAUL HONORE

(Copyright, 1925, by Charles J. Finger)

OPPOSITE the prison in the town of Padua, there was, in the year 1778, a barber shop, and in it, a tall awkward lad, who was left in charge, spent more of his time reading Defoe's *Robinson Crusoe* than in pushing trade. So business fell off. Certainly the youth looked diligent and attentive, and he was quite courteous, but a giant of a lad standing well over six feet, broad-shouldered and strong as an ox, is not the kind to handle scissors or razors, especially when his mind is dwelling on the killing of savages; nor when the talk of such a one runs to outlawry and the like, is he likely to inspire confidence in the minds of mild old Italian gentlemen. One day when the youth sat, wide-eyed in wonder, his eyes deep in his book, the father came in from a day spent in the country, and, after looking in the box where the money was kept, with a view to ascertaining the state of affairs, but finding nothing to please him, fell into loud lamentations. But as soon as he had come to a pause, the lad broke into a wonderful tale about the experiences of Crusoe, telling of his horror on finding the footprint in the sand. At that it was some time before the father could find words to express his emotion, his mind running on his own troubles and not on those of the shipwrecked sailor, but when he recovered, there was a lively torrent of denunciation, with the son soundly berated for his idleness.

Now on one side of the barber place was a wineshop, and at the fag end of the day men often looked in after taking refreshment, to tell and to hear the news, such having been the custom for many years. So, as man and boy stood in perplexity, the son with eyes bright and shining and his mind on far-away lands, the father pondering with deeply corrugated brow, passing townsmen stopped, caught the drift of what was going on, and, in the manner of men, fell to advising and consulting, making their neighbor's business their own. It added to the solemnity of the affair that a stonemason, who had been working at the monastery nearby was of the party, and he was one who had much to say. Being heavy and ponderous of speech, qualities which often pass for wisdom, he was listened to, and his advice was to the effect that if read the lad must, then he should occupy himself with sacred books as did the monks in the place where he worked just then. That led to fragmentary talk and argument of much length, and, before the violet shade of the prison had darkened the shop, the fate of master Giovanni Belzoni was settled.

"Either books or beards it must be," declared the father, "so a monk you shall be, and time may show what becomes of all these idle dreams of profane sailors and heathen savages."

Because of that, into the Capuchin monastery young Belzoni was put, and there he stayed until he reached the age of twenty-four years, a giant of a monk with muscles of steel and dark flashing eyes, one who stood head and shoulders above any in that town, being, indeed, six feet and seven inches in his sandals.

Being, happily, a practical man who was quick with his hands, he managed to pass the time well enough, though he was often sadly wearied with altercations and arguments. But he found a kind of outlet in the study of hydraulic engineering, his instructor being an aged monk who had wandered far afield in his time and who told the young giant of wonderful things in the world; of Archimedes and his spiral; of a burning mirror by means of which, it was said, at the siege of Syracuse the Roman fleet had been set on fire; of Ctesibius and his steam engine; of the great lighthouse of Pharos; but especially of the land of Egypt where were obelisks, and pyramids, and the wreckage of hydraulic machinery used in bygone years. That last fired the young monk's soul and the hope of a life of activity filled his horizon.

After that there was little more cloistered peace for Belzoni. News came into the monastery of new wonders and excitements, of Nelson at the Nile and at Copenhagen, of Bonaparte setting the world on fire, of a strange ship without sails that moved on the river at London. Most wonderful as it seemed was the extraordinary news of a great burning glass made by an Englishman named Parker with which the rays of the sun had been made to fuse gold in four seconds and silver in three. There was much more stirring and in Belzoni there grew the idea that he lived in a dead world, while outside the monastery walls were opportunities, interests, pleasure, and, above all, activity. Then one morning the young man, who hungered for mechanical things and seemed tied to philosophical, started off, a loaf of bread and a flask of monkish cordial in his sack, and he trudged the roads westward until he came to Genoa. There he took ship, working his way as a sailor, and in time landed in London Town.

For awhile he enjoyed the clamor of voices, the ant-like activity of the rivermen and porters, the noises of the horses and the brawny-armed fishwives, the sight of the bargemen and sailors from all ends of the earth, but soon his pockets were empty. He had almost made up his mind to buy a porter's knot and learn the trick of carrying burdens from the holds of ships up steep and narrow gangplanks, when fate threw in his way a seedy looking fellow who had much to say and many genial prophecies to make as to what might befall if the young giant would agree to place himself in his hands. So the stranger led the way through many streets until at last they came to Smithfield, where, as it seemed to the Italian, a mad world had gathered. For Bartholomew Fair was in full swing and an amazing crowd jostled and pushed and elbowed; everywhere were flags and noise, laughter and singing, the sounds of fiddles and fifes and drums. There were people grimy, others bright and gay in fine clothes; in front of booths were great painted banners telling of wonders within—of pig-faced ladies, of wild animals, of spotted boys, of boxers and wrestlers, of Chinese jugglers. All London seemed to be eating, or drinking, or dancing, or standing about the doors of taverns.

It was the cunning dodge of the stranger to match his new find, for a consideration, against the Irish

giant who challenged any man to wrestle, but it fell out that as the two passed along, Belzoni was attracted by the sight of a sword swallower by the side of whom stood the show manager, gazing skyward and yawning, for the wonder by which he made his living interested him not at all. But while Belzoni stood lost in interest, the stranger, who was a man of resource and one quick to turn a penny, honest or otherwise, slipped away and entered into negotiations with the manager, selling that which he owned not. For he assured the manager that the big man in the crowd was his property by a kind of contract, and told many other lies, plausible and otherwise. On the whole, he managed matters so well and so dishonestly that in less than an hour's time he went off with money in his pocket, while the ex-monk was engaged, painted, dressed and crowned with a gorgeous velvet cap surmounted by an immense plume of white feathers, and two trumpeters announced, throughout the Fair, that the Patagonian Samson would carry about the stage any five men, at one and the same time, who cared to pay sixpence apiece for the privilege.

"The fine fellow threw off his velvet cap," writes old John Thomas Smith in his *Reminiscences and Recollections*, "and four chairs were placed around him, by which we ascended, and after throwing our legs across his lusty shoulders, we were further requested to embrace each other, when another man leaped, by means of a small wooden ledge fastened to Samson's girdle, and sat on our shoulders." A fourth man sat in Belzoni's arms and a fifth stood on the wooden ledge, and Belzoni "performed his task with an ease most stately."

That went on for some time, then the Patagonian Samson developed into the French Hercules, his own manager, performing feats of strength about the country, a happy cheat lying about his own powers, keeping mysteries going, bamboozling silly folk, startling the natives of a half-hundred towns. His famous advertisement worked splendidly with people agog for a fresh sensation, and it read:

Sig. BELZONI the Great
will cut
A Man's Head off
And Put It On Again
ALSO SEE
THE GRAND CASCADE!!

The last was a spectacular exhibition in which the Italian had employed his ingenuity, inventing what he called an "Hydraulic Temple," which on the first performance somehow went wrong, for the Grand Cascade became unmanageable and the water from a large tank overflowed, inundating the orchestra and showering those in the pit. But, by the quick wit of Belzoni and the coolness of his chief actress, who afterward became the wife of the poet Thomas Moore, a panic was averted and Belzoni, with Barnum-like acumen, made capital of the affair.

But the adventurer had a soul above that of a mere showman, and one day a rush of purpose burst upon him. It was when he met a Frenchman who had been in Egypt with Bonaparte and from him heard the story of a desert country through which a great river ran. At once the practical mind of Belzoni was all aglow. The dream of transforming a desolate place into a garden filled him. Not for nothing, he thought, had he studied hydraulics in the monastery. Where the conqueror had destroyed and plundered, he, Belzoni, would build and enrich. Where the Corsican had raised discord and anger and unrest, he, the man from Padua, would devote his life to social progress and order and peace.

So the show business, and money-making, and popular applause were abandoned, and Belzoni started to Egypt to make a wilderness fertile and to convert a place of drifting sand into a land where millions might live a busy, healthy life. But he soon found that his energy and strer could not win ag apathy and ind ence, against incompetence and irresponsibility, for the Egyptians would have nothing of his plans and ideas, so his vision of a land of fair cities died.

Then he turned his attention to other things. If the Egyptians disregarded the wealth he offered them, then they were not worthy of the valuables that they had, art treasures and antiquities and ornaments and statues, made by greatness long since dead. There was the granite Rameses II that stood at Thebes, for example. They saw it every day without appreciation, but at the British Museum in London it would be a wonder for admiration. So Belzoni laid his plans before a Mr. Henry Salt, British Consul General, and soon the monument was on its way to England. After that there were other things, pyramids to explore, temples to search, tombs and ancient buildings to examine, excavations to make, all of which Belzoni did. He discovered the Temple of Serapis, visited the emerald mines of Jabel Zabbarah, shipped treasures by caravan and by boat, crawled through passages in lost temples, fought Arab mobs, suffered hunger and thirst and desert heat, and when at last he returned to England, it was as a man famous among the learned and great. His own city of Padua honored him like a monarch and struck a medal in his memory.

There was one conspicuous appear-

Announced throughout the fair that he would carry any five men at one and the same time, who cared to pay sixpence for the privilege.

ance as a strong man in London, though not in an official or professional capacity. It was in the year 1820, at the coronation of George IV, when the doors of Westminster Abbey were closed in the faces of the crowd gathered to see the ceremony and to champion the cause of the rejected Queen Caroline.

Belzoni, with his friend John Murray, the publisher, and one or two other sturdy souls, had no idea of bawling and sweating with the mob outside when they had tickets of admission. So there was an attack on the door, Belzoni being very active with an improvised battering ram, and, in spite of the opposition of soldiers and the band of professional pugilists who acted as royal pages, the heavy-handed Samson got in.

For three years Belzoni enjoyed the [illegible]ny of the famous of his day and [illegible]ccepted as somewhat of an archeological expert, then, one morning the learned world rubbed its eyes reading this:

"From *The Observer*, of 1823.

*January 20, 1823.*] [*Price 7d.*

"Belzoni leaves town tomorrow on a new journey; but whether to make a tour through Persia or to try to trace the route of Mungo Park is not certain. Friday the traveller dined with the Duke of Sussex."

About the same time another peculiar item was in the newspapers to the effect that

"Lady Esther Stanhope (a) continues to reside in the Deserts of Syria as chief of a tribe of Arabs. She will not suffer an Englishman to approach her.

"(a) Lady Esther Stanhope (1776-1839) was the eldest daughter of the Earl of Stanhope, and for some time presided over the establishment of her uncle, William Pitt. In 1810 she left England, and spent the rest of her life in the Levant, where she adopted Eastern habits and obtained a great ascendancy over the tribes."

So it was guessed that Belzoni would probably "rescue" the titled lady. His real intention, characteristically hidden, was to make his way into the heart of unknown Africa, to Timbuktu. He landed on the Slave Coast and started his march, but, at the little native town of Benin in Southern Nigeria, he was seized with an attack of dysentery and died, December 3, 1823.

## St. Gregory and Usury

SAINT GREGORY, of Nyssa, wrote thus of interest on money:

"He who would give the name of robbery or parricide to the iniquitous invention of interest would not be very far from the truth. What, indeed, does it signify if you have made yourself master of the wealth of another by scaling walls or killing passers-by, or if you have acquired what belongs to you by the merciless method of the loan?"

***I read in the papers*** of Winnipeg, Calgary and Vancouver the full-page advertisements of the department stores which the Hudson's Bay Company has established in succession to its local fur trading posts. The company is the oldest chartered concern in the British Empire, dating from 1670, and until 1869 it owned and governed all of Western Canada, as well as the regions about Hudson's Bay. The famous "point" blankets that the company continues to sell were probably the first instance in the world of a one-priced article marked so that the customer could have confidence in the transaction. The blankets are made in four sizes and originally were exchanged for beaver skins, the currency of early trading days. The largest blanket has four black markers or "points" dyed into its edge, indicating that the price was four large beaver skins; the medium-sized blanket had three full-sized and one short "points," the price being three large and one small beaver skins and the small blanket has three full "points" for three large skins.

*The International Jew* in 4 volumes: *The International Jew*, Vol. I, 235 pages; *Jewish Activities in the United States*, Vol. II, 256 pages; *Jewish Influence on American Life*, Vol. III, 256 pages; *Aspects of Jewish Power in the United States*, Vol. IV, 246 pages. Price: 25 cents each; set, $1. The Dearborn Publishing Company, Dearborn, Michigan.

***I read in the papers*** that the Florida land scandal is about cleaned up. It was a very courageous thing for Florida to do, thus to take the bull by the horns and run the risk of the inevitable misunderstanding of Florida land values which would follow upon an exposure of the real estate liars and pirates. THE DEARBORN INDEPENDENT had the facts a long time ago, but they involved men of a race with which this paper had other affairs to settle at the time. So it is all to the good that the exposure and clean-up came from other sources. It was a shame the way the parasites swarmed to Florida and played their game under the reputation for straight dealing which Floridans had established. It is always the way with these things; outsiders come in and spoil it. When Californians handled the real estate situation in their state, everything was straight and above-board. When Floridans handled the Florida boom, everything went smooth and straight. Then the fly-by-night fakers came in, and the game went bad. States should strictly protect themselves against this sort of thing. For the man who is "stung" never stops to think that the faker who "stung" him may have come from the East side of New York, he only remembers that he was "stung" in Florida. It is the name of Florida that suffers. And Florida should exercise a relentless control over the class that is jeopardizing her good name. We who know Florida know that all the mess was not of Florida creation; it is the work of speculative outsiders. But it is plainly Florida's duty to clean them out, for the sake of her own good name. The country applauds her efforts in these lines.

***I read in the papers*** that the much disputed "obey" in the marriage ceremony of the Protestant Episcopal church has at last been officially dropped by action taken at the Triennial General Convention in New Orleans recently. At the same time was eliminated the bridegroom's promise, "With all my worldly goods I thee endow." Even so, no marked change in the marriage relations is anticipated.

***I read in the papers*** that the Journal of the American Medical Association warns that "Civilized man is losing the taste for natural flavors and demands that his palate be tickled by various artificial flavors and condiments. These are not only expensive, but harmful. Not only are they irritants to the gastrointestinal mucosa, but they lead to overeating, for which they are largely responsible. . . A considerable economy could be obtained in this direction if more uncooked foods were eaten, such as salads, fruit, nuts and cheese, and if those foods which must be cooked were cooked for a shorter time."

***I read in the Harvard Alumni Bulletin*** that President Lowell, of Harvard, had this to say in a recent speech on the World Court: "There is a common impression that the founders of our national government had very little to do with foreign countries and believed in a policy of isolation; whereas in fact the relations with foreign countries were more insistent, more critical, and required more constant attention during the administrations of Washington, Adams, Jefferson and Madison than at almost any period since. . . . The Court will make international law, and from such a body let us not leave ourselves out."

It might be well if there was a revival of the international understanding and breadth of vision of former days.

# How I Wrote "The Man With the Hoe"

(*Continued from page 4*)

a new social order, which would sweeten toil and would shelter the people from the many needless disasters of existence.

All these experiences and studies prepared my mind to catch at least a glimpse of the vast problem involved in Millet's great painting, *The Man With the Hoe*, the grimly powerful picture of a French peasant bowed over his hoe in a field, the picture of a brutalized toiler. I came upon it, in 1886, reproduced in *Scribner's Magazine*, which was printing a series of articles on Millet and the austere and noble realism of his work.

Millet made his artistic home in the shadow of the forest of Fontainebleau. He has a Homeric directness in his paintings. He tries to make the common express the sublime. He endeavors to make the infinite visible. He is a democratic Michael Angelo. He is a Jupiter in wooden shoes.

(*After the famous painting by Millet.*)
"Bowed by the weight of centuries he leans upon his hoe and gazes on the ground,
the emptiness of ages in his face . . . ."

In *The Man With the Hoe*, I saw that Millet had swept his canvas bare of everything that was merely pretty, and projected this startling figure before us in all its rugged and savage reality. I was drawn and held by the terror of it: I saw in it the symbol of betrayed humanity. I immediately jotted down in my large notebook a few of the opening lines of my poem. They set the Hoe-man before us as Millet saw him on the fields of France:

Bowed by the weight of centuries he
leans
Upon his hoe and gazes on the ground,
The emptiness of ages in his face,
And on his back the burden of the world.

Here were the few opening words, just enough to hold the place, enough to nail fast my purpose to write a poem that should cry the lost rights of the toiling multitude in the abyss of civilization—the multitude helplessly chained to the present, fettered to their narrow field, deprived of the enlarging education of the mind, deprived of the ennobling education of the heart.

I had made my entry in the notebook, but the cares of the world swept in, and the poem was not finished. But during the next thirteen years I made frequent and prolonged visits to my mother's home in San José. There I wrote out in their first form many of the lines of the poem. But they were only whirls of star-dust not yet concentrated into a moving orb.

After leaving the Sierras, I found myself, in 1898, in Oakland, at the head of the Observation School of the State University. During the summer vacation I was rummaging my old notebook, hoping to get on the trail of some suggestive memorandum for a poem. I suddenly came on the unfinished draft of the Hoe-poem. Mrs. Markham joined me in thinking that this must be the next labor of my pen.

But months slipped by till the next vacation in December; when I happened to go over to San Francisco to see a loan exhibition of great paintings. I had hardly entered the door when I saw something that thrilled me to the core of my soul, a painting that dominated the whole room: it was the original of *The Man With the Hoe*, from the immortal hand of Millet!

It had been lately bought for $60,000 by Mrs. William Crocker, whose family took an eminent part in the building of the Central Pacific Railroad. During the great fire of 1906, this painting was seized by a daring hero and carried to safety through flame and smoke and falling timbers.

I sat for an hour before it at the loan exhibition, sat there absorbing the majesty of its despair, the suggestion of its injustice, the tremendous import of its admonition. I saw in it the ruin of man, the ruin wrought by the powerful over the patient, of the strong masters over the silent workers.

I sat there for an hour, the pity and sorrow of this tragic figure growing upon my heart. I felt its terror, its mournful grandeur. I could not have been more deeply moved had some fearsome shape risen before me from Dante's dark abyss.

Of course, the Hoe-man is not *any* man using a hoe. Thoreau hoed his bean field near Concord; and he says that when his hoe tinkled against the stones, the music echoed out to the woods and skies. Thoreau could gather two harvests—a material and also a spiritual harvest. Why? Because he had the upward-looking and the light, and could hear in his soul the music and the dream.

I saw that the Hoe-man is not Thoreau the philosopher, nor is he the American farmer riding rosily on his reaper in the chromo.

I realized as I looked that I was gazing on no mere man of the fields; but was looking on a plundered peasant, typifying the millions left over as the debris from the thousand wars of the masters, and from their long industrial oppressions extending over the ages.

This Hoe-man might be a stooped consumptive toiler in a New York sweat shop; a man with a pick, spending nearly all his days underground in a West Virginia coal mine; a man with a labor-broken body carrying a hod in a London street; a boatman with strained arms and aching back rowing for hours against the heavy tide of the Volga.

Nor had his battle been confined to his own life: it was a battle that extends backward through his long train of ancestry to a remote antiquity. He was the multitude that molded the bricks of ancient Egypt—the multitude that paved the Appian Way and lifted the massive blocks of the Pyramids—the multitude that fought for Timur and Attila, not knowing nor asking why, and then sank like the

millions of raindrops into oblivion.

From this vision of the Hoe-man—his genesis and his destiny—I went home that afternoon like a man under a spell. I seemed to have come into first-hand contact with one of the tragic realities of our existence.

Immediately on reaching home, I wrote out the first stanza in its completed form. All the rest of the day I could only ponder and wonder over this arrested life, over this man who had lost step with the divine music of the world, over this victim of hopeless and joyless labor, over this piteous hulk of humanity degraded below the level of the roving savage of the wilderness. I saw in him the savage of civilization.

I woke the next morning at the break of day with the idea of my second stanza laid away, as it were, in the drift of the mind, ready to be molded into form. Leaping swiftly out of bed, I wove some of my old material with new lines that flashed swiftly in; and there on the page my second stanza stood complete.

*"That Poem Will Go Down the Ages"*

I could do nothing else that day upon the poem, nothing except to moon and croon over the lines, changing a word or revising a phrase. The next morning I awoke with the idea of my third stanza ready and waiting for the activity of my pen.

Strange as it may sound, each of the two following stanzas appear to be handed down to me in the same fashion, handed down, one by one, out of the white fire of the morning.

All the stanzas seemed to me more like gifts than creations. Where did they come from? Were they, in the deep of the night, laid away in the mind by powers that we know not of? Perhaps Hamlet is right when he cries out,

"There are more things in Heaven and earth, Horatio,
Than are dreamt of in your philosophy."

This is the brief story of how I happened to utter the awe and grief of my spirit for the Hoe-man, for the ruined majesty of this son of God. The poem sprang from my long purpose to speak a word for the humiliated and the wronged. I bore my witness. It is said. It is truth. Let it stand.

The poem was typewritten and in my pocket. On New Year's Eve, 1899, I attended a literary gathering in San Francisco at the home of Carrol Carrington, a friend of the famous Ambrose Bierce, the literary autocrat of the Far West. Bailey Millard, Juliet Wilbur Thompkins, and other literarians were present.

Each one was adding something to the hilarity of the evening. I was called on: my Hoe-poem flashed into my mind. I rose and read it.

Usually after a reading there is some applause. Auditors may applaud because they have enjoyed the reading. Or they may applaud because they are glad the reading is over! In my case there was no applause whatever. There were two minutes of utter silence.

Then Bailey Millard, the editor of the San Francisco *Examiner*, sprang to his feet, walked swiftly to my chair, and asked to see the poem. He read it hastily; then read it again, handing it back with the words, "That poem will go down the ages."

A little later, Mr. Millard urged me to let him print the poem, saying that he would announce it for two weeks in his columns, would print it in conspicuous type in the middle of his editorial page, and would herald it with a lengthy editorial.

So the poem appeared on the eighteenth of January, 1899, in the dawn of the twentieth century.

Dr. David Starr Jordan, of Stanford University, seized on the poem as a text for a lecture, wherein he made a plea for world peace, charging that the Hoe-man, the brutalized man, is caused by military selection in all lands. The best and most vigorous young men are selected to go into war and become cannon-fodder. Thus the weaklings are left to propagate their kind, causing a gradual degeneration of the race. This wholesome doctrine was proclaimed from hundreds of platforms in the Far West.

My friends among the editors were soon telling me that the Hoe-poem had caught the imagination of the nation. It seemed to stir the social idealism that lies deep, though often dormant, in the breasts of men. Within a month, it seemed that all the papers on the continent were printing the poem, with editorial comment.

Letters began to pour into the newspapers—some attacking the poem, others defending it. It was attacked from all points of view—theological, biological, geological, chronological, anthropological, zoölogical, phrenological. Thousands of men, ranging all the way from professors to plowmen, gave vent to their pent-up feelings in voluminous letters.

*The Battle of the Critics Rages Amain*

*I am happy to report that no plowman, no workingman, ever misunderstood the poem.* It appears that all workers looked upon it as a declaration in defense of their world-old cause.

But whenever one man attacked the poem, five or six men attacked *him.* Thus there were more defenders than attackers—five to one. But, oh, that one man who attacked was a man highly valuable to the poem, for it was that one belligerent person who kept the merry controversy alive—kept it alive for nearly two years.

Many of the attacking forces did not seem to understand that the Hoe-man refers—*not to the worker* in his best estate, in his higher and more intelligent condition—but refers only to *the millions caught down into the hell of drudgery*—the millions who have no time for rest, no time for thought, no time for the lofty hopes and dreams that make us men.

The Far West was the battle ground where the controversy was hottest. All the San Francisco newspapers, for several months, carried a page that printed the vast number of letters pouring in concerning the poem. I myself had a new experience in a deluge of letters from all parts of the world.

Soon the poem gave rise to a multitude of epigrams, witticisms, cartoons, parodies, essays, debates, sermons, printed volumes. One industrious doctor of medicine collected—as I remember it—more than four thousand parodies, including poems inspired by the Hoe-poem.

*It Was Given a New and Fresh Fire*

At this point, the whole battle was given a new start and a fresh fire, when Colis Huntington, a builder of the Central Pacific, suddenly offered a prize for an answer to the Hoe-poem. The New York *Sun* conducted the contest; and the enormous prize offered called out more than five thousand answers. Edmund Clarence Stedman and Thomas Bailey Aldrich were among the judges.

John Vance Cheney won the prize. I knew him well; and I wrote him a letter congratulating him, saying that his poem was a true creation of the Muse; but that it was unsound in its philosophy—was un-American and undemocratic. For Cheney takes the ground that the Hoe-man is "cast for the gap," is created by the Almighty for us intellectuals to stand on in order that we may keep our hands white, and may keep our feet unsmirched by the dust of the common road.

I look on Cheney's poem as the most pessimistic poem ever written in America, if not in the whole world. For the American idea is that no one is "Cast for the Gap," but that every one is created to rise to the highest levels. It is the duty of government to keep open all the gates of opportunity so that there shall be nothing to obstruct the common man in the achievement of the common destiny.

It has not been altogether pleasant to talk so much about myself; but it was not possible perhaps to tell the story in any other form.

## The "Origin of Species"

A STORY is told of Bishop Wilberforce, of Winchester, who, at a dinner, had to listen to a talkative young man across the table who had much to say of Darwin and his "Origin of Species."

"I can't see," said the young fellow, "what difference it would make at all to me if my grandfather was an ape."

"No," returned the Bishop, "I can't see that it would. But it must have made an amazing difference to your grandmother."

# Dollville's Annual Show

## Tiny People of All Nations Meet in Friendly Rivalry

By M. NORRIS DAVIS
ILLUSTRATED BY FLORENZ CLARK

AMERICA is a land of shows, exhibitions, pageants and displays. We are all familiar with the yearly automobile show, the style pageant, the health exhibits and the canned goods week displays, but only a comparatively small proportion of the population of the United States is permitted to share in and enjoy that most unique and interesting event—Portland's Annual Doll Show.

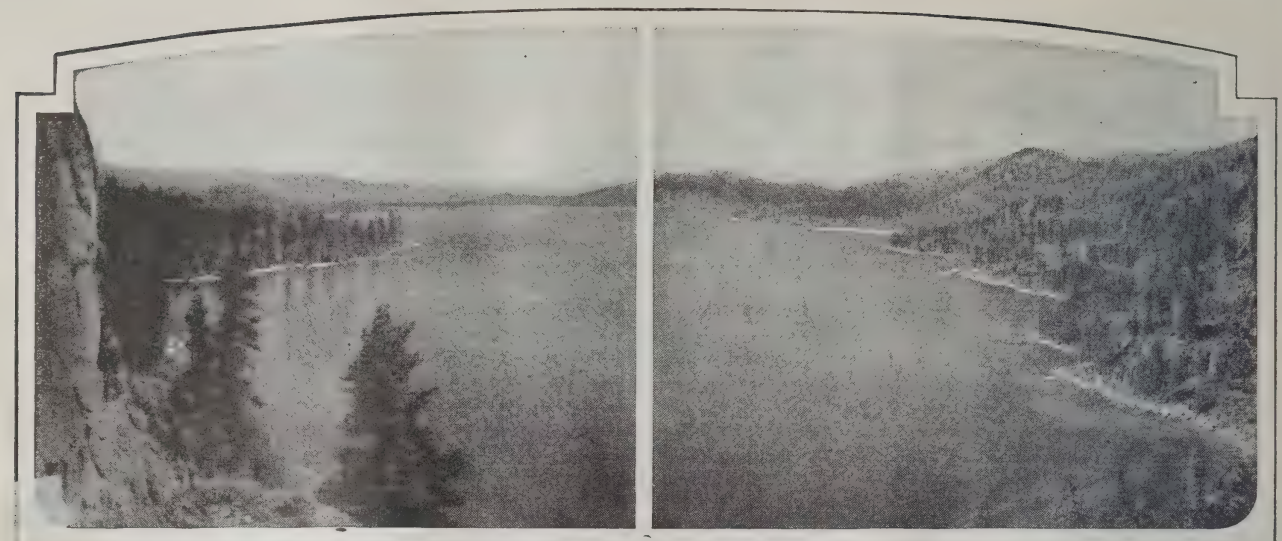
It is in Dollville, on an upper floor in one of the largest department stores, that the celebration is held. Coming in the autumn of the year, when most dollies need new wardrobes, the youthful "mothers" take added pleasure in fashioning dainty garments for their families, knowing that there is a chance for them to win one of the prizes at the show—or if not, at least to have the joy of seeing their favorite on exhibition, and to receive the present that is given each child that makes an entry.

For the last twenty-three years Dollville has been the scene of great excitement when the dolls were brought in, registered, classified, exhibited and judged. Competent, impartial women are named as judges, and they have a mammoth task before them in deciding upon the winning dolls. Although there are hundreds of dolls entered each year, there are thirty-four prizes in cash and toy merchandise given, so that there is a fair chance for a child to win from the class to which her doll belongs.

The special prize of $25 is offered to any organization or individual (adult or child) entering the best group of dressed dolls, consisting of not less than ten dolls. At the last show, this prize was won by a woman's club, who "staged" a most effective wedding party, with bride, groom, ring-bearer and other attendants.

The other prizes, for groups and individual dolls, are divided into classes. The best-dressed baby doll, the most attractive walking and talking doll, the character doll dressed truest to type, the prettiest bride, the most bewitching kewpie and the manliest boy doll, each have an opportunity to carry the tag that designates a winner. And the six-inch doll has an equal chance with the twenty-four-inch one, for the twenty-nine classes provide for that.

All dolls are welcomed to the Doll Show, whatever their style, size, complexion or costume. There is no entry fee, and each one there means that some little heart is hoping that her doll may win a prize. A quaint relic of other days is the first doll ever made in England, which rubs shoulders with a pert, plump kewpie. Court ladies in glistening robes look down upon dimpling baby dolls, in their long white dresses. The histories and customs of other nations are revealed in the dolls that hail from Japan, France, Holland, Iceland, Italy, Russia, Sweden and Australia.



There are wooden dolls and china dolls, a great many of bisque and a few of leather. There are even dolls made of soap, close beside the Raggedy Anns of cloth. For several years there has been entered a cheese dolly, but so far she has not succeeded in carrying away any of the honors. (It is safe to conjecture that this figure is made from fresh material each year.)

Having an annual doll show of their own, Portland children are especially interested in the Festival of Dolls that occurs in Japan each year. On "the third day of the third month" each Japanese family goes to its fireproof storehouses and takes out the dolls and toys that have been accumulating there for generations.

With great ceremony these dolls are carried to the best room in the house, and arranged on shelves. The richer the family, the more dolls there will be in the rows—sometimes there are dolls enough to cover six or seven shelves, twenty feet long! Each doll is exquisitely dressed, and surrounded with its own tiny belongings. Small figures, representing the emperor and empress in antique court costumes, with the five court musicians (each with his special instrument) preside over each feast. Before this group delicious food is placed, by the little girls of the family; at each meal, for three days, this is repeated.

But how sad it must be for the little Japanese girls when the Festival is over, for the dear dolls and their cute belongings are packed away until another year. They cannot be fondled and dressed and undressed all through the year, as are American dolls. No doubt that is the reason why they pass from one generation to another!

Two views of Lake Tahoe as seen from Cave Rock.

# The Magic of Lake Tahoe

## A Titanic Cup of Granite Which Melting Snows of Ages Have Filled

By JULIAN HAWTHORNE

I NOTICED that, the higher toward the sky we climbed, the farther away it looked. It became a new revelation in blue, pure, delicate and intense, unknown to lower earth. It was spiritual, but just on the hither side of the limits of human sympathy.

There is nothing like it in Italy or in Switzerland; it isn't so virginal there: nor in India, unless you include the Himalayas. I never made acquaintance with Everest, except, from a distance, as a pallid ghost, a mountain of death. It has left behind it what we call sky, and soars into an awful solitude of transparent midnight, which noonday suns may enter but cannot illuminate, and the diamond-points of stars have no kindly twinkling. Such a sky is too appalling for beauty, and cannot rival the skies of Tahoe. When you reach Tahoe, stop and be content; you are high enough. Let those jagged rims of naked granite that surround it, and tower thousands of feet above it, delight your eye, but remain unprofaned by your foot: they are more profitable to imagination than to lungs and legs. You will gain nothing by plunging knee-deep into those white streaks and dapplings that gleam from their crevices and unsunned hollows—the frozen shreds of flesh which are all that nature has left on those gray skeletons of the planet. They are better so than made into snowballs for your trivial sport.

When the young Fremont, nearly a hundred years ago, looked down from those heights upon Tahoe, his first impulse, we may be sure, was to clamber down to that lovely azure: and Balboa, staring down from his peak in Darien three centuries before upon the Pacific, had a like desire, though what he beheld was less beautiful than this. The Spaniard stared as at an apparition; but there was the ardor of a lover in the gaze of the American.

View across Lake Tahoe.

The transparency of this atmosphere makes game of what artists term "aerial perspective"; and here is demonstration of the philosopher's dogma that space is an illusion of the mind. You concede (though you doubt it) that yonder summit may be a mile away; but to claim that it is twenty is absurd! But these exalted regions have a quality of their own, which we must learn as we would a new language. There is none of the dust and vapors of the lowlands. Its very touch is different—a benign softness and freshness, a freedom from material contamination, which make us realize with indignation how much our lungs have been abused hitherto.

But the softness is not voluptuous; it stimulates and exhilarates. During several days, however, it may slow you down a little; in this unadulterated medium of life, the substance of life seems to be lacking. You gasp for breath, and while your spirit soars, your body needs support. Well, rest and sleep for a while and in due time mind and flesh will resume their harmony. Regeneration is not an instantaneous process. Clouds are sky-born, and the clouds of Tahoe are worthy of their parentage. I had thought I knew whiteness; but it is not what I had supposed.

Those lowland masses of fair-weather clouds—cumulus is the name bestowed by science, I believe—had seemed to me hitherto to be the very apotheosis of white; but the whitenesses that rise around Tahoe taught me better. Islands float away from those radiant continents, and become diaphanous, and dissolve into the strong azure in which they float. The shores

from which they had detached themselves sometimes hang silent and almost motionless all day long; they heave their shoulders above the mountain rims and dwarf the planet itself.

But not seldom their interior regions begin to be modeled by hues of tender gray, which darken here and there, and now you are aware of that wondrous murmuring which betokens storm. The dazzling ranges are joined by allies as stupendous which come crowding up from the horizon with mutterings of stately menace, and the united majesties sweep slowly against the sun, which smilingly crowns their advance with splendor as he vanishes; outside the battlefield the untroubled blue still reigns. Now resound the echoes of Thor's hammer, and the sparks of his blows leap out like darting snakes, or shimmer in the distance. Soon, with a rushing and rustling among the pines, down comes the rain, pelting the dull earth with multitudinous laughter, the confetti of the vaporous carnival.

These summer revelries are soon over, but before it passes Thor will aim one blow directly at us, with a detonation to split your eardrums; and perhaps that tall old pine which has stood erect for a hundred years, now bows its high plumes to fate, shudders from crown to root, and, smitten asunder, falls. But the god of the thunderbolt is already grumbling in the distance.

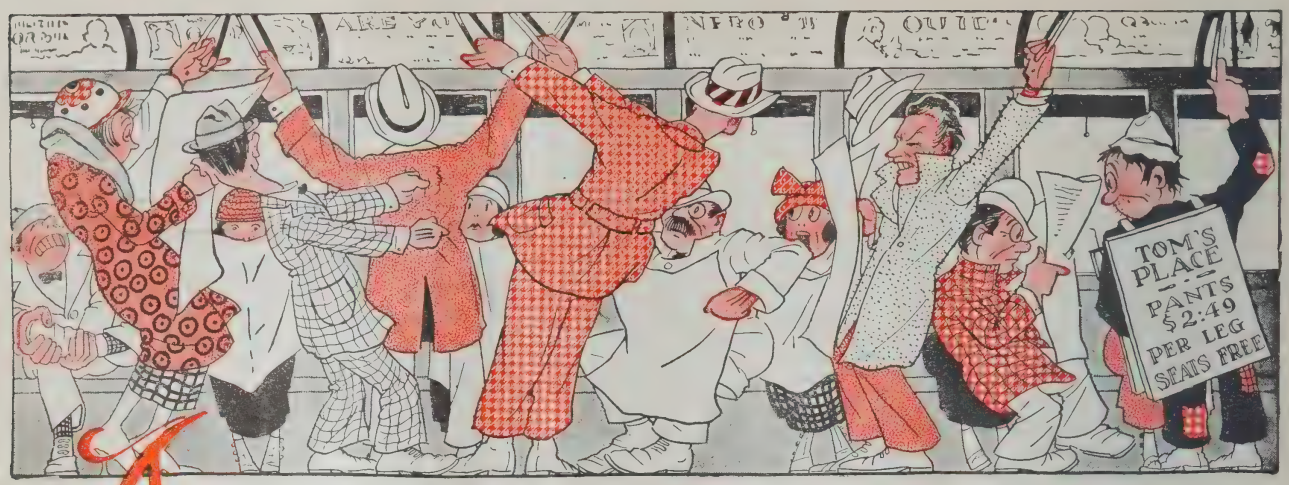
Toward evening, the kings of the air gather in the west, putting on ceremonial robes. But at Tahoe, as elsewhere, though we know that the sun will set at the hour appointed, we can never foretell a "sunset": those fine humors and dispositions of the atmosphere that declare themselves in colors are too subtle for our prognostic. The most promising preliminaries prove ever and anon barren, and we are put off with pale yellows and neutral grays. And at other times, when the paraphernalia seem inadequate, and we say, "There'll be nothing tonight," behold! what imperial splendors all at once begin to glow and throb, and we run to get our neighbors to witness!

Tahoe, however, disappoints us comparatively seldom, and nowhere else is the pageant more exquisite. These tints are never heavy or turgid, but of a vivid translucency and lightsomeness that might defy even the rainbow itself, which must always deploy its hues against a darker background. Painters attempt them, but they are not to be reproduced from the resources of a mortal palette, not to be described in words, one might say not to be seen by the bodily eye. They tell their story to the soul, and memory or dream may faintly recall them.

They vanish abruptly, having so little kinship with earth, and then, after an interval, the stars begin their silent story. In the early weeks of summer, Venus, this year, was attended by Mercury, who flitted nimbly between her and Apollo, an atom of surprising brilliance in that golden field. But there is a queenly leisureliness about the larger planet, in contrast to the restlessness of the little Messenger of the Olympians. Meanwhile, in the east, arises the colder radiance of Jupiter, a Kohinoor of the heavens; I have a notion that Saturn is not far off, but Mars, whether or not canalled and inhabited, has withdrawn, perhaps offended at our official skepticism as to his human kinship with us.

Mount Tallac at Lake Tahoe.

Overhead stretches that cosmic belt of mystery, the Milky Way, with its Pleiades and Orion, its Betelguese and Bear. How they sparkle, and all but speak! They look so alive and so real and near, that we begin in some faint degree to understand their incomprehensible remoteness. Those little dots and specks of light that we discern from sea level are exiles in comparison.



As for the moon, she seems to brush the tips of those pines that clothe the crest of the high eastern hill behind which she rises, and so bright is she that the eye flinches from her. A "dead world," forsooth!

Up here, we surprise nature in her factory. The place is but partially finished. Here protrude the gigantic bones which elsewhere are clad in the flowing contours of the habitable. The geological story, or surmise, has been told, and you may read it if you will. But it is too craggy and primal for ordinary digestion. What we see is granite, pale like those monsters which are said to dwell in the unsunned depths of ocean. They impend above us, they lift rank beyond rank behind each others' shoulders, they stagger aloft in incredible precipices. Here and there a pinnacle cuts the sky sharp as a tower of Cologne Cathedral, but a mile higher.

Altogether these Titans build themselves into a vast oval surrounding the many-tinted blue of the lake. You take them in at one eye-glance, but you might pass strenuous years in traversing their gulfs, gorges and acclivities. Here is granite enough to construct all the greater cities of our States and of Europe, and yet leave scarce a trace of the quarryman's work upon their sides. The mirror which reflects their array lies in such a crater as our telescopes reveal on our satellite, a record of cataclysm to exhaust the stretch of imagination.

Indeed, our geologist affirms that this sky-piercing wall is but the base and remnant of the heights that preceded human history. On the granite was piled lava, and on the lava heaped themselves thousand-foot layers of the primeval snows. Impenetrable clouds covered the vault of the sky, and snow hardened into ice; and there were no waters to fill the gulf that yawned between the cliffs. In these temperate days we think the Poles are desolate; but mortal fancy falters before this scene.

The clock of Time was set to centuries instead of to hours. But Change is older than Time and will outlast it. The glaciers began to move, grinding the granite beneath their heel and rending the lava from its hold. The gates of the rivers were unlocked, and their torrents raged downward and mingled their volume with the snows that brimmed the basin, and from that titanic turmoil was conceived the vast vase of purity that we name Tahoe. The mountains look (Continued on page 31)

# Advertising Old and New

## Publicity Methods, Like Literature, Have Become More Intensive With Passing Years

BY JAMES R. DANIELS

ILLUSTRATED BY WILLIAM H. FREYSE

AMERICA is rapidly becoming a nation of addicts. Picture no blear-eyed wretches, stealthily snuffing cocaine; visualize no drink-crazed sots quaffing spirituous liquors. Although we have these human wrecks they represent but a small percentage of our population. But the addicts number into the tens of millions.

Addicts are those who read ads. And who does not? With newspapers, magazines, billboards, street cars, storewindows and letters brought into play, the advertising barrage bombards us.

Quack remedies and "cure-all" advertisements which are so strictly censored by some publishers are not the creation of the modern copywriter. Witness this glowing gem which appeared in the *Mercurius Politicus* in 1660:

> Gentlemen, you are desired to take notice, That Mr. Theophilus Buckworth doth at his house on Mile-end Green make and expose for sale, for the public good, those so famous *Lozenges* or *Pectorals*, approved for the cure of Consumption, Coughs, Catarrhs, Asthma, Hoarseness, Strongness of Breath, Colds in general, Diseases incident to the lungs, and a sovereign Antidote against the Plague, and all other contagious diseases, and obstructions of the Stomach; And for the convenience of the people, constantly leaveth them sealed up with his coat of arms on the papers, with Mr. Rich. Lowndes (as formerly), at the sign of the White Lion, near the little north door of Pauls Church; Mr. Henry Seile, over against S. Dunstan's Church in Fleet Street; Mr. William Millward, at Westminster Hall Gate; Mr. John Place, at Furnivals Inn gate in Holborn; and Mr. Robert Horn at the Turk's Head near the entrance of the Royal Exchange, Booksellers and no others.
>
> This is published to prevent the designs of divers Pretenders, who counterfeit the said Lozenges, to the disparagement of the said Gentlemen and greatly abuse the people.

Literary advertising is usually much quieter and in better taste than the more commercial variety, and this is as it should be, for creative work cannot be produced, bought and sold like hair tonic. Book advertising consists largely, though not entirely, in quotations from reviews. Publishers' ads show less change than other varieties; however, there have been great changes in their style from those of bygone days. Some of the advertisements current are models of good taste, dignity and salesmanship. Nevertheless another type of ad is all too frequent:

"Was Freud right? Is love sex? Read this most daring story of married life ever written. Every page is a thrill, every chapter grows more startling."

There is no better way to study the manners of a period than through its advertisements. The writer of an ad is not posturing for the benefit of some future historian. He is trying to induce the man in the street of his own time to buy. In attempting to stimulate purchasing the advertiser uses methods that will appeal to his readers. The advertiser cannot afford to go over the head of his public. He must employ the style that will bring forth immediate response from his readers. This is why ads reflect public taste so accurately.

Today the advertiser must be brief. We are in the age of speed. Yesterday, with fewer books and a more leisurely existence, the snappy, pepful slogan would have evoked horror and indignation. In the fifties a book could receive no higher praise than "elegant." "Elegant," "durable," "moral," these were the favorite adjectives of book publishers and reviewers. "Rabelaisian," "sensational," "exotic," "gripping," are now in common use.

It is interesting to compare publisher's advertisements of the present with those of the past. Whereas at present it is customary for a publisher to print elaborate and beautifully arranged catalogs and to advertise widely in newspapers and magazines, it was formerly the custom to insert many pages of advertising after the indexes of books. A survey of the publications advertised on the back of an old book printed in 1851 at Philadelphia is highly diverting.

They consist of a "Catalogue of valuable books published by Lippincott & Grambo, particularly suitable for public and private libraries."

The range of subjects is very wide, including a large selection of Bibles and religious works, standard poets, farmers' and farriers' encyclopedias, history, books of deportment, and, in fact, every branch of publishing.

In 1851 the Mexican War was a thing of the immediate past. Therefore we find numerous lives of Generals Taylor and Scott together with exciting tales of the campaign. The titles are enough to tickle the fancy of any lover of bold, dashing deeds—*El Puchero; or a Mixed Dish From Mexico;* or *Camp Life of a Volunteer* by "One Who Has Seen the Elephant."

A blurb that some enterprising publisher would do well to copy is that detailing the virtues of *A Dictionary of Select and Popular Quotations, taken from the French, Greek, and Latin, etc.* The publishers remark:

> "We should judge its author had surely been to a great feast of Languages and stole all the scraps. A work of this character should have an extensive sale, as it entirely obviates any difficulty in which readers are involved by the frequent occurrence of Latin,

Greek, etc., passages which we suppose are introduced by authors for a mere show of learning. This Dictionary of Quotations effectually removes the difficulty, and gives the reader an advantage over the author; for we believe a majority are themselves ignorant of the terms they employ. Very few truly learned authors will insult their readers with Latin or French phrases when plain English will do as well."

Judging from the various books of correct behavior, in this list, the young people of 1851 were most polite. Consider:

"The American Chesterfield or Youth's Guide to Wealth, Honor and Distinction, containing also a complete Treatise on the art of Carving."

And for the gentler sex there was the Rev. Bennett's "Letters to a young Lady, on a variety of subjects calculated to improve the Heart, Form the Manners, and Enlighten the Understanding."

This so excited the House of Lippincott & Grambo that they declared:

"We sincerely hope (for the happiness of mankind) that a copy of this valuable work will be found the companion of every young lady, as much of the happiness of the family depends on the proper cultivation of the female mind."

That's the way they advertised in 1851!

Of all the goodly company advertised by Messrs. Lippincott & Grambo, very few have survived the passage of time. Of these few Lawrence Sterne is one, and this too in spite of the fact that he was evidently not regarded in the best light by the publishers, for, while they confidently predict that a life of John Paul Jones will become as popular as *Robinson Crusoe*, they praise Sterne's *Tristram Shandy* but faintly. Listen to this:

"To commend or to criticise Sterne's work in this age of the world, would be all wasteful and extravagant excess. Uncle Toby, Corporal Trim, The Widow, the Captive, even the Dead Ass, this is all we have to say of Sterne; and in memory of these characters, sketches and histories, a thousand follies and worse than follies are forgotten."

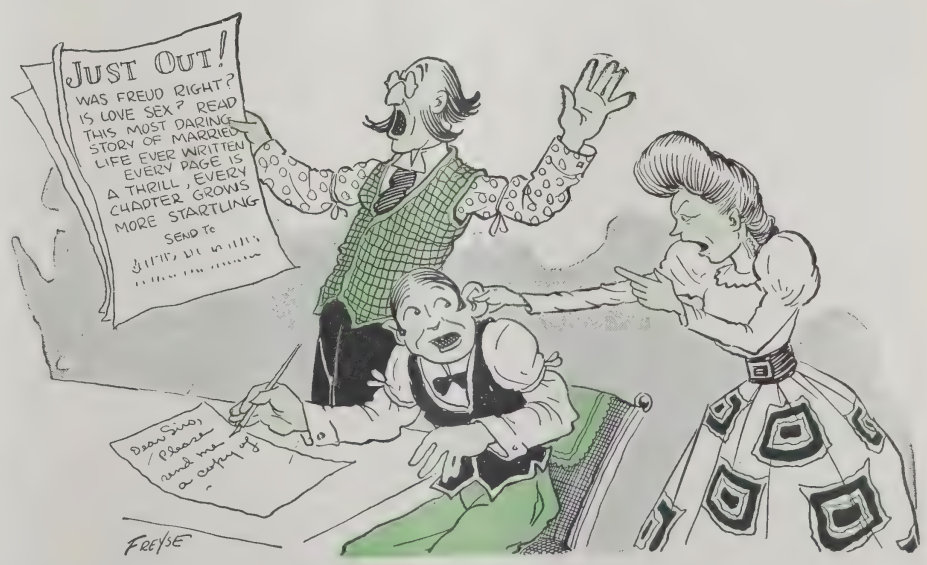
Now is that any way to create an insistent demand for Sterne's books? Publishers nowadays are not so lukewarm. But if Sterne was somewhat slighted the Hon. Luke Shortfield was not. Mr. Shortfield essays Olympus with two gems: *Wild Western Scenes* wherein are narrated "Desperate encounters with savages—conflicts with serpents and minute descriptions of bear, deer, buffalo hunts," and *The Western Merchant*. This last contains useful instruction for the Western Man of Business who makes his purchases in the East. Likewise hints for those who design emigrating to the West, deduced from actual experience." The publishers describe the *Merchant* as follows:

"Business, Love and Religion are all discussed and many proper sentiments are expressed in regard to each. The moral of the work is summed up in the concluding sentence 'adhere steadfastly to your business; adhere steadfastly to your first love; adhere steadfastly to the church.'"

From these descriptions one would conceive Mr. Shortfield to be a noble, courageous, pious son of the West. With what consternation do we discover on another page a novel called *The City Merchant, or the Mysterious Failure* by J. B. Jones, the author of (Oh, horrors!) *The Western Merchant* and *Wild Western Scenes*. Is such duplicity possible? Can the dashing (yet wholly moral) Luke Shortfield and this J. B. Jones, with his knowing talk of cities, be one and the same? What does the child of the rude frontier know of the slick city merchant? And how could the town-bred Jones have acquired his "actual experience"?

Included in the list of standard poets is found the name of Mrs. Hemans. Felicia Dorothea Hemans died in 1835. But her poems went marching on. In 1851 she was ranked with Byron, Milton, Gray, and Cowper. In presenting a new edition her American publishers sang her praises in language that deserves to be immortalized. Hearken to this:

"As no work in the English language can be commended with more confidence, it will argue bad taste in a female in this country to be without a complete edition of the writings of one who was an honor to her sex, and to humanity, and whose productions, from first to last, contain no syllable calculated to call a blush to the cheek of modesty and virtue. There is, moreover, in Mrs. Heman's poetry, a moral purity and a religious feeling which commend it, in an especial manner, to the discriminating reader. No parent or guardian will be under the necessity of imposing restrictions with regard to the free perusal of every production emanating from this gifted woman. There breathes throughout the whole a most eminent exemption from impropriety of thought or diction; and there is at times a pensiveness of tone, a winning sadness in her more serious compositions, which tell of a soul which has been lifted from the contemplation of terrestrial things, to divine communings with beings of a purer world."



Turning from such lofty utterances to publishers' ads of the present day:

"A Whale of a Book!"

"Hits the Bull's Eye!"

"The Smart Novel all Society is Reading!"

And so it is with a feeling akin to "winning sadness" that we revert from the old ads to the new. No more the rounded sentences, exalted language and impassioned peroration. Truly as the poet (*not* Mrs. Hemans) so succinctly says, "Them days is gone forever!"

"Yesterday, with fewer books and a more leisurely existence, the snappy, pepful slogan would have evoked horror."

With all its bunk and blather, its absurd pretentious and "zippy" methods, advertising has played a tremendous part in developing America. Critics may satirize the advertising game and it has many ridiculous aspects, but it has accomplished great good.

Manufacturers have staged numerous advertising campaigns which have improved public taste in art, decoration, and the worth while. They have spent good money in telling Mr. Everyman and his wife how to be healthier, live in greater comfort and appreciate beautiful things. Incidentally, this type of advertising has been profitable to the advertiser, but isn't that legitimate? Certainly the American home today is better furnished, more comfortable, and is managed with far less drudgery than before the spread of advertising.

Dishonesty and misrepresentation in advertising are rare. It does not pay to have millions of buyers deceived. They may bite once. After that they not only shun the faked product but they cause their friends to do likewise. Reputable firms cannot afford to trick their customers. This is why nation-wide advertisers, spending huge sums every year, are reliable.

Advertisements, the best of them, are attractive. Well-known illustrators paint, draw and etch for nationally known products. Their work goes into many homes where there is no other artistic influence. Compared to illustrations for ads of the past, those of today are masterpieces.

The type in which an ad is set contributes no little to its success. A survey of contemporary magazines shows enormous improvements over older specimens. The greater use of "white space" and the advance in types are the principal changes advertising has made lately. Pick up this month's magazine and place it beside one of twenty years ago. There is a vast difference, and for the better, in their merely superficial appearance.

"And for the gentler sex there was the Rev. Bennett's letters to a young lady, on a variety of subjects calculated to improve the heart, form the manners, and enlighten the understanding."

Window dressing, too, has made great strides in the last twenty-five years. Compare the cheerful, well-lighted, nicely proportioned, department store displays of the present with yesterday's wax dummies, cardboard signs and general jumble.

What is known today as the trend of modern advertising is a development of the period from 1850 to the present. Prior to that time there were roughly two periods: The pre-printing stage to about 1450 and the early printing stage to 1850.

Advertising no doubt had its inception when man commenced to live in communities and competed with his neighbors for the necessities and luxuries of life. Much evidence has been unearthed that before the time of movable types there were handwritten announcements and inscriptions on walls. One of the oldest known advertisements of this type was written about 3000 B. C. and offered a reward for a runaway slave. This papyrus is now in the British Museum.

The earliest advertisements were merely announcements of events or a new product or a new method of marketing the product. Today, however, they are highly scientific, reliable commercial news of the manufacturer's wares, and people read and believe them as such.

# Thanksgiving Among Other Nations

THANKSGIVING Day is not exclusively an American institution. It was not initiated first by the Pilgrims. In one way or another it is celebrated in most of the civilized countries of the world. There are certain features of Thanksgiving Day as observed in America that are peculiar to this country. They are turkey, cranberry sauce and sweet potatoes.

A feast day of thanksgiving, at some time of the year, is a custom in nearly every European country. The Czecho-Slovaks have two autumn celebrations, one, *Obzinky*, which is a harvest home festival, and the other, *Posviceni*, which commemorates the consecration of the church. At the first celebration the merrymakers tie up the last grain in one gigantic sheaf, dubbing it the "old woman," and delivering it at the farmhouse with many appropriate ceremonies which end in a feast for all. In Monrovia the people actually tie up an old woman in the last sheaf, and the sheaf, without the woman, occupies a place of honor until Christmas arrives. In the Ukraine, the season that corresponds to our Indian summer is very short and disagreeable, and it is known as "Old Woman Summer."

The Ukrainians celebrate their thanksgiving in the spring because their autumn begins in mid-September and consists mostly of rain, while their spring is extremely pleasant. In feasting, a suckling pig represents the *piece de resistance* instead of turkey.

In Germany the harvest feasts of thanksgiving are made famous by the wholesale production of "klaben" or raisin bread which the good *hausfrau* makes in great quantities.

In Italy there are local picnics and feasts after the crops are harvested but no definite date of thanksgiving.

Denmark substitutes the goose for turkey. The goose comes into its own on Mortensday, or St. Martin's Day, and the harvest being mostly the cause of the jollity the rural districts make more of it than the cities.

In Poland the girl who has proved the most efficient gatherer of the harvests is decorated with a wreath and becomes the queen of her village, while prolonged dancing and eating rites are observed. This ancient Polish custom is dying out largely because of the advent of American farm machinery, which is much more efficient than the old gleaner method of harvesting. Therefore the object of the festivity has become more or less pointless.

Finland holds harvesting bees much as did America's own pioneer forefathers when labor was scarce and neighbors few and far between. Prayers for the next harvest are offered at this time.

In Norway the farm owners are hosts at many village banquets. Instead of turkey, the national bird in this instance is the "rype" or grouse.

Lithuania and Sweden have no festivities peculiar to themselves beyond small and local feasts of general thanksgiving when the harvests are in.

# Value Reflected in Sales

The practical economy of Ford ownership is appealing to an ever-increasing percentage of the motoring public.

Long famous for reliability and low cost of operation, Ford cars now have distinctive beauty and unusual riding comforts as additional characteristics.

As a result Ford sales everywhere are reaching new high peaks, while all previous production records have been shattered in meeting the demand.

It is an impressive victory for value—a striking proof of how the public benefits through Ford resources and the Ford policy of complete manufacture—from mine to finished car.

FORD MOTOR COMPANY, DETROIT, MICH.

Ford

# If the Movies Say It Is—It Probably Isn't

(*Concluded from page 6*)

starring the very ignorance that they attempt to conceal by dint of publicity and advertising. It proves that producers, directors, stars, actors, editors and cutting staff know nothing about what they are doing, taking for granted that if they are wrong the audience won't know anything about it.

The story in question has to do with a "secret code" that is stolen from one government at the behest of another government, principals being represented by agents in the rôle of ambassadors, free-lance diplomats, special agents, disguised individuals even the criminal element. Naturally the beautiful vamp, in modern parlance, must stalk through several scenes to inculcate upon us what she wants to do—and she must put on nine gowns and three sable cloaks to do it so that we can understand her. By we I mean the chap who has hocked a part of his lunch to take the best girl out, the fellow who buys his "benny" on the installment plan, and the white-collar worker who just inked the cuffs of the one he bought in 1914, and the ladies accompanying these several gentlemen. Those vamping gowns perhaps explain the high cost of government, I suppose. Think of how many changes a woman must be provided with before she can be safely employed as a code-wrestler!

***The Double Identity Stunt Was Introduced***

Well, considering the number of codes in existence, their theft in actuality is as rare as solar total eclipses. In one of the large New York theaters I witnessed during Labor Day week—that's pretty recent—a "thrilling" movie in which the "Secret Service" was the party of the first part, since it was obliged to recover a stolen code that a band of clever crooks was to sell to an international agent due to arrive from Europe a few moments before an amateur sleuth was drafted to repossess it. The double identity stunt was introduced, but what's more important, in this case the "code" was a sheet of letter-size paper, folded as millions of us daily fold our correspondence, as if it were the letter of a hardware dealer, say, acknowledging an order for one monkey wrench. How that piece of paper survived all the handling without tearing is still incomprehensible to me, and such paper ought to be commended to all those who require writing paper a little tougher than leather but not so hard as sheet iron.

Where did the director of that movie ever see an official government code of that shape, size and appearance? If he has ever seen one he is entitled to another million dollars' salary. In reality, codes are either large books or small ones, the latter not unlike pocket dictionaries, although I myself have handled an important diplomatic code which was folded like a map, printed on paper almost as heavy as bristol board. It was about ten feet long and when spread out a special easel was provided to hold it in convenient position. Folded, it was about the size of half a newspaper page.

***The Cloakroom Attendant Was a Spy***

Of course, the average spectator does not know a code from a cod, and takes the movies' word, if at all, that it is as depicted. It would have been so easy for all these directors who have given us such absurd "codes" to write to the Department of State for information, and no Secretary of State, I am sure, would have declined to furnish some descriptive data for the sake of fidelity if nothing else.

In another similar "stupendous" thriller, the code was left in an overcoat pocket by an embassy secretary who was so undiplomatic as to leave the garment, with its important contents, in the cloakroom. I admit some diplomats in this world don't look as if they were much more diplomatic than this movie diplomat, but to begin with diplomats cannot carry codes around and about like that. A code has a fixed place. If it is moved there must be an emergency—and no emergency would ever be by way of a dinner party.

The cloakroom attendant was a spy. How did you guess it? You see, you know much about movies.

Nothing could have been more stupid than the film of the *Eternal City*, Marion Crawford's famous novel, which was shown a dozen years or so ago. Although I was born and educated in Rome I failed to recognize the Eternal City and much of what went on; the "props" were all there, but as to the rest, it was a sadly ludicrous spectacle.

No one has a grudge against the movies and no reformer will find support who would destroy the movies, but there is no doubt that more and more patrons every day are tiring of the sort of stuff which exceeds cinematographic license and ignores the ends of the fictional.

## Majesty and Muddle

AN ODD light is thrown upon the ways and customs of royal society in the days of Charles II, from some of the letters of Fr. Tixier. He tells of seeing the English king at supper with Louis XIV and the two queens of Compiégne, and we have a vision of the monarchs at table wearing their hats, getting along quite comfortably without forks. The passage says that every time Maria Theresa spoke to Charles II, he lifted his hat to her, and "by the end of the meal his hat was most terribly greasy . . ."—*C. J. F.*

# Driving the English Language Out of the Philippines

(*Concluded from page 7*)

Some of them know precious little English, and that not of very high order. But they must all teach it. And to the very best of their ability they do teach it. I was present at the written examination of the foremost normal school in Manila, and I was on the campus on the day following commencement at the university and saw the photographs of the academic procession, and got the echoes of the day and its doings, and I have only words of the highest praise for the attempt that is made to give to those who are to lead the rising generation of Filipinos the best English possible.

But here we meet the difficulty which is concisely stated in this paragraph quoted from a document whose presentation and criticism is the purpose of this article:

> In teaching English, Filipino graduates of the University may be considered as having 75 per cent of the average efficiency of American teachers. A fair number of these may use English at home in preference to their native dialect. A few of them may marry college graduates, may adopt English as their family tongue, and may transmit the same to their children. But such men and women will always be a small minority in the Filipino community.

This I judge to be a fair statement from an article whose main purpose I shall presently state and most earnestly oppose. The graduate of the University of the Philippines does not speak English any too well. He uses it with grammatical correctness, but he has heard it almost entirely from teachers who are themselves but meagerly equipped to use or teach it.

The entire expense of the system of education employed in the Philippines is borne by the people of those islands. The United States does not pay a dollar of it. The system is maintained by taxation in the Islands, and remarkably well maintained, all things considered.

There has recently been issued in Manila a pamphlet of fifty-three pages by Najeeb Mitry Saleeby, M. D., D.Sc., entitled *The Language of Education in the Philippine Islands*. Dr. Saleeby is a Syrian, who was a resident of the United States in 1901, and one of the eight hundred teachers sent out by the United States Government. He has made considerable study of the languages and dialects of the Philippines, and has written several books or pamphlets on special subjects relating to these matters. His pamphlet is the occasion of much discussion at the present moment in the Philippines, and the daily papers have hot articles, not omitting fierce personalities, growing out of the publication and its discussion.

I will summarize Dr. Saleeby's argument, and mostly in his own language, though much condensed:

> The first stage of education is in the home, and the language used is the vernacular. The second stage is in the school, and the language is that of popular public instruction. The third stage is after school, and is in the vernacular. In America and in European countries the language of popular education is the vernacular. But in the Philippines the middle period of education is conducted in English, which is neither the language of the pupil's home nor that of the community into which he is to emerge.
>
> For more than three centuries Spain had the Islands and was not able to compel a common language, and the United States can never do so. Only a small minority of the people of the Philippines could speak Spanish in 1898. The military occupants of Manila after the victory of the Americans, and the Philippine Commission that set up the new civil government, were in agreement. An irresistible impulse came with the flush of victory and a driving zeal for action. It was determined to teach the Filipinos the English language. The Filipinos could not wish for a greater blessing than to have English as their home tongue. Spanish is out of the question, and the more than forty dialects of the Filipinos are a bar to common purpose and organization. But can the English language be taught to a million children by three hundred American teachers? Certainly not. And how shall it be taught by Filipino teachers who are mostly not even of high school grade?

His conclusions may be summarized thus:

> English should be taught in all the elementary and secondary schools. But it can never become the common national language of the Philippines. The language of public instruction should be the vernacular. Even if there be no common vernacular, three regional vernaculars, embracing the languages of the largest tribes, are preferable to one foreign language, and no financial consideration should prevent the people from the use of their own tongue.

But the Government of the United States does not intend to leave the Islands without proper safeguards of the interests which for a quarter-century she has created and safeguarded, and her compulsory use of English does not need as its justification any imperialistic design.

The newspapers of Manila for the most part do not appear to take this movement seriously. Not much of the reading public of the Philippines is Spanish, and Spanish readers will grow fewer. The attempt, therefore, to build up a newspaper constituency using the Tagalog would mean disaster to the newspapers. The leading newspapers in Manila, even those owned by Filipinos, are printed in English and will continue so to be printed. And the business men, even those who are Filipinos, do not want the Tagalog. But the movement has support in high places. Among those who are said to favor the Saleeby plan are Honorable Rafael Palma, president of the University of the Philippines; Professor Otto Scheerer, head of the department of Oriental languages in the University; Dean Francisco Benitez, of the College of Education; Dean Jorg Bocobo, of the College of Law; Dean Maximo M. Kalow, the extreme partisan of the anti-American group, and his brother, Honorable Teodoro M. Kalow, Ex-Secretary of the Interior. These are prominent names, and they are all of men committed to the anti-American program. More ominous is the list of scholars in the United States whose names are proclaimed as having written approvingly of Saleeby's plan. No doubt other names will be printed of American scholars and politicians to whom Saleeby's clever and misleading document has been mailed.

It is to be remembered that this plan does not grow out of the reluctance of the Filipinos to learn English. *They rejoice in the opportunity. To them the English is at once an introduction to the world of books and the field of business opportunity.* The opposition comes from a group of educated men who want to limit and as far as possible eliminate American influence in the Islands.

As for the thing proposed, it is as wild a scheme as ever was suggested since the erection of the Tower of Babel. The United States might as well declare that inasmuch as there are Indian tribes that have not learned the English language, the several Indian dialects may be taught regionally in the public schools, and Choctaw made the official language of the United States. America could as easily unite on Choctaw as the Philippines on Tagalog.

# Copp's Hill, Where Heroes Rest

(*Concluded from page 8*)

of his ships came in, the crew, with muffled oars, transported the cargo into the mouth of the tunnel whence the servants by torchlight bore it to his home. Gruchy was a member of Christ Church and gave to it from his treasure the four little angel figures that adorn the front of the balcony. But his magnificence was short-lived. After a few years he made over his property to his father-in-law and vanished from the town.

Phipps and Gruchy were typical of the North End, bold, seafaring men, pros[illegible]us and always ready for ad[illegible] while the Copp's Hill boys [illegible]ame to conjure with throughout the settlement.

***Pranks and Pageantry of the Past***

On Pope's Day, the fifth of November, was their annual contest with the boys of the south end of the town. Each faction, with an effigy of the Pope and perhaps of other political figures, paraded through the domain of the other, collecting coins, as they went, for their celebration. At evening the rivals met, and with a battle of fists, each tried to take away the other's pageantry. If the South Enders were successful, the effigies were burned on the Common; if they lost, the North Enders built their bonfire on Copp's Hill. This custom persisted until the Revolution, when the patriots realized that dissension, even in sport, was dangerous, so John Hancock gave both sides a dinner at the Green Dragon and persuaded the leaders to vow eternal friendship.

But the North Enders were too turbulent to remain altogether peaceful. They respected their agreement and left the South Enders alone, but, after the Revolution, many were the battles with snowballs on the ice of Charles River between the "Copp's Hillers" and the "Charlestown pigs." When Josiah Quincy became mayor, he put an end to this foolishness.

Henry Ward Beecher was a North End boy while the glory of the race persisted. "Follow the leader" was the test by which the chieftain was acknowledged. On one occasion a line of boys filed through the house of the Reverend Doctor Eliot and into the dining room where the family was at dinner. The irate clergyman hastily followed them to the door, administering a hearty kick to the last one out.

One day when Beecher had "stumped" all his followers except one, he jumped down the sheer cliff of Copp's Hill to the embankment beneath. Picking himself up, he saw that his rival had been equally willing to risk life and limb, so he ran down to Billy Grey's shipyard and out on the wharf where a vessel was moored. Up the rigging to the very top of the foremast he climbed and from there jumped into the river. When he came to the surface his companion stood on the deck, watching open-mouthed for his appearing, and young Beecher's sovereignty was established.

Its boys, its captains, and its preachers, all contributed about equally to the prestige of the North End. Here lived the Mathers, the glory of New England, and in the oldest part of Copp's Hill Burying Ground, near the Charter street gate, is the family tomb. This is the spot most frequently visited in the cemetery. A plain brown slab, greatly worn by time, rests upon a brick foundation, and on it is this inscription:

"The Reverend Doctors Increase, Cotton, and Samuel Mather were interred in this vault.

'Tis the Tomb of our Fathers
I died Aug. 27, 1723 Age 84.
C died Feb. 13, 1727, 65.
S died June 27, 1785, 79."

This tomb is owned by the descendants and is occasionally in our day used for burial. It is forbidden to make any more graves, but every once in a while the tombs are opened and some scion of an old Boston family is laid to rest with his ancestors. So it is that in this small plot of three and a half acres 10,000 persons are buried.

No wonder that a stroll through its paths brings up in fancy the figures of the old days. Here lies Deacon Shem Drowne, the cunning artificer who made the grasshopper on Faneuil Hall and the "wooden image" of Hawthorne's story; Robert Newman, the sexton of Old North Church; Nicholas Upsall, persecuted for his kindness to the Quakers, and William Mumford who bought a lot on Brattle street in 1694 and erected the first Quaker meetinghouse.

***"Perfidiously Slain by ye Indians"***

Along with the peaceful friends are tombs of a warlike significance. That of Captain Malcolm, although dating before the opening of hostilities, boldly proclaims him a "true Son of Liberty, a Friend of the Publick, and an enemy to Oppression." It also states that he lies in a grave ten feet deep. Here, indeed, British bullets could not reach him, but they did their best to destroy his stone. It was their target from their battery on Bunker Hill, and its numerous scars show that their aim was not so bad.

Here lies Major Samuel Shaw, an officer in the Revolution. In his boat, the *Empress of China*, he first carried the flag of the United States to that country. His descendant, Robert Gould Shaw, is honored by a bas-relief on the Common. Here is the stone of "Capt. Thomas Lake, aged 61 years, an eminently faithful servant of God and one of public spirit." As the legend continues, he was "perfidiously slain by ye Indians at Keenebec August ye 14th 1676." The lead from the bullets taken from his body was melted and poured into narrow slits across the stone.

***The Builder of the Ship "Constitution"***

Not all the graves have such a heroic theme. They say that Mrs. Ammey Hunt, who died in 1769, had a fearful bother with bounds and fences in her lifetime, and so the poor soul took the consolation of a very final, yet perfectly ladylike, last word. This is her epitaph:

"A sister of Sarah Lucas lyeth here
Whom I did love most dear,
And now her soul hath took its flight
And bid her spightful foes goodnight."

In the northwest corner is the tomb of Edmund Hartt, builder of the frigate *Constitution* which rides at her mooring just across the river. Nearby is that of Captain Joseph Leonard who brought a slip from the willow by Napoleon's grave in St. Helena and planted it beside the family tomb. It grew to a mighty tree, lending a romantic charm to that corner of the cemetery until the gale of 1888 destroyed it.

Near the Hull Street gate is the tomb for the mariners of all nations, and not far from that was a mound, now leveled by the process of time, where those poor little waifs, the unbaptized children, were buried. The stone of the grandchildren of William Copp is the oldest in the yard, bearing the date 1661. There is a tiny stone dated "July ye 5, 1690," marking the grave of Sarah Rule, aged nine, the little maid who once incurred the wrath of Samuel Mather by daubing his papers with ink.

A triple stone marks the grave of the first keeper of Boston Light, George Worthylake, and that of his wife and daughter. One November day in 1718 the three set sail for Noodle's Island, and, as the record states, "took in Heaven by the way." Their sad fate was the theme of Franklin's poem, "A Lighthouse Tragedy," which was popular in its time, but which the poet's father deemed pretty wretched stuff. No copy is extant today, and quite likely the world is no loser.

The faithful spouse of Betsy Darling was for many years a sexton, and when his wife departed this life and he felt old age approaching, he placed this request upon her monument:

"Brother Sextons, please leave a clear berth for me near by this stone."

Along with such homely messages there are rows and rows of stones carved with the armorial bearings of the families they represent. There are the Hutchinsons, the Gees, the Montfords, proudly dating back to the Norman Conquest, and dozens of others richly carved with heraldic lore.

# The Magic of Lake Tahoe

(*Continued from page 23*)

down upon it in tranquillity; and we little creatures camp and crawl upon its margins; build hotels and piers, and scoot over its surface in speed-boats. But the scene is too great to be vulgarized. And by and by our little era will pass away, and the mountains will forget that we were.

Emerson, whose poetry dwarfs mountains, loved pine forests, dwelt among them, and often refers to them in his poems.

When I am stretched beneath the pines,
Where the evening star so holy shines,
I laugh at the pomp of Greece and Rome;
For what are the pride and power of the Street,
When man, in the bush, with God may meet?

He muses on how—

The sacred pine-tree adds
To her old leaves, new myriads;

And—

No architect can build
As the Muse can;
She is careful to select
Materials for her plan:
Rafters of immortal pine;
Cedar incorruptible,
Worthy her design.

His temple was among the pines of Walden; and Walden, lying deep and clear in her cup of mystery, which is fed by no visible streams, and from which is no outlet, is not unworthy to be classed with Tahoe, or rather each is in its own quality and degree incomparable. Emerson, however, might have considered Tahoe to be too large—an extravagance of beauty. Walden lies in thought and memory like a jewel; it is a lyric, a quatrain. Tahoe is epical; it conveys a thousand emotions. Emerson found in Walden the concentrated perfection that his genius loved and portrayed.

But he could not have escaped the Tahoe pines. In his day, indeed, the forests that crowd upon the shores of the lake, and range upward almost to the high mountain tops, were far more primitive than contact with man has made them now. After the rush of Forty-Nine these regions were penetrated by gold-seekers, and to serve their needs, the tall trees must fall. Down came the giants, and their bodies and members were transformed into sluices, retaining-beams, tramways and docks; the voices of bear and wolf gave way to the ring of the American ax.

*The Surge of the Pioneers*

After the surge of the pioneers had swept by, the real subduers of the wilderness followed, and their log huts and fences took further toll; but the forest, undaunted, met the attack with new armies, drawn from the roots of these who had perished. This second growth gave way in time to a third, and now a fourth begins; while the ax, though it bites still upon occasion, has slackened its offensive. But the battle is not over, and will last long; a time may be at hand when the shores of the lake may be lined with commodious board walks, with frequent piers and pavilions, and picturesque villas will rise above flowered terraces and the inevitable summer hotels will expand their verandas and galleries above lawns and playgrounds, and the old story of the fashionable watering place will be repeated; indeed, at the northeastern end of the lake it has already begun, and though the roads are not yet asphalted, the automobiles are numerous; they follow the woodpaths and the asphalt will follow them.

*Speed-Boats Waiting at the Wharf*

At the hotel you can get the luxuries of the city (if that is what you come to Tahoe for), and there are speed-boats waiting for you at the wharf, and fish also waiting in the lake, though they are not always as eager to take the hook as you are to take them. But if your culture and refinement are less sensitive, or if you are willing to forget them for a while, and study the finer things of nature, lurking beneath the sand and the sage, the pine needles and the shrubbery, and flashing before you from the lake: if you will pitch your own tent, draw and boil your own water, fry your own bacon and fish, and roll yourself in your own blanket for a nap or a night, while the waves lap at your feet and the pines murmur overhead; if you are content that sunrise and sunset, planets and stars, take the place of Chinese lanterns; and exchange the blare of the jazz-band for the night-silences and mysterious whisperings of the woods: then turn your back on the twentieth century, and invite your soul and spare your purse. The pines, even the second and third growths, have a story to tell, if you have courage to listen to it.

The pines outnumber the other trees hundreds to one, and botanists will tell you that there are fifty species of them alone. There are also groves of thick growing aspens, with white-green trunks and talkative leaves, of a tint so cool that you might fancy they twittered to keep warm. Oaks, too, and other adventurous trees have scaled these heights; but they are guests rather than fellows of the omnipresent pine. The aspens go to marshy places, sinking their roots in the oozy verdure that is fed by the underground springs that trickle down from the summits, generated from last winter's snows.

But the pines like to keep their feet dry; their sinewy roots ramble off near the surface, cross the forests roads, giving a jolt to the unwary auto driver, and, in fact, seem to feed less on earth than on air. The hard, pale granite peeps through the red-brown carpet of their fallen needles; they flourish on the naked rock, and stand for ages. Many of these rugged boles, even after Forty-Nine had come and gone, are from three to four feet in diameter, and mount aloft a hundred feet and more. Their bark is thick and furrowed; some species, at a distance, show the diamond-pattern of serpents. Shoulder to shoulder they stand, yet without undignified interference, for they will shed their lower branches if the space require it, and expand their plumes only when they reach the sky.

Often, pushing through these pillared labyrinths, you will come upon a grayed and whitened corpse lying prone, across and upward, slowly turning its own substance into the dust and mold of its grave. Ants excavate in it their galleries and forums. You can thrust your walking stick through the disintegrated fibers which defied gravitation for a hundred years; in death the monster is not contorted, but lies straight as in life, accepting fate. Some of these have been struck down by lightning; others were leveled by the ax, and abandoned; a few have succumbed to old age. But often a victim of the thunderbolt is not overthrown, though its life is gone; but years of sun and frost have blanched it ghastly white, and its bare limbs appeal to heaven. Others, death-stricken, began to fall, but were caught halfway by their comrades, and lean rigidly against that vain support. Dead or alive, the pine keeps its character.

The feature in a pine forest that affects me most is the exquisite straightness of the trunks. Up they go, undeviating, like lances, like arrows, like the shafts of the Parthenon, like the minarets of the Taj Mahal. They are slender just enough to escape the thought of weakness; they taper like the diminuendo of a musical note. We trace that clean smooth uprush through the branches which enhance its beauty by their rectangles, and see with joy its triumph at the top. Nothing in architecture so vindicates the loveliness of the straight line, acme of simplicity. It becomes in the pine the living symbol of a moral quality—an abstraction that is palpable. A man may learn virtue in the pine woods.

*A Great and Beautiful Work of Nature*

Some enthusiastic Californian or Nevadan would have it that Tahoe is "an inland sea!" But it seems to me to be precisely not that. It is a mountain pond, twenty miles by twelve, held in a cup of granite two thousand feet deep. And the lowest bottom of that pond is a mile above the highest point in the city of Los Angeles or of San Francisco. It is a great and beautiful thing, but its beauties are

not sea-beauties; the rhythm of its waves, the character of its shores, its calms and storms, its hues and changes, its evenings and its mornings, differ from the sea as much as do its dimensions. To compare them is not to dignify the lake, but to stultify and belittle it.

It is a noble chalice of the gods, lifted above the earth, but of it, its waters chill and pure, neither fevered by summer heats, nor frozen by the cold of winter. Its lovely surface covers a black abyss, precipitous, craggy and terrible, wrought by primeval earthquake and volcano; life, light and motion are absent from it. How many years, how many generations must have passed before the eager river plunging from the snowy heights ... fill this vast space and find its ... nd tumult subdued to this broad ...quillity! How long before the cup was filled to overflowing, and became the mother as it had been the offspring of the westward-flowing torrent!

Tahoe must always be a distinct picture in the mind of whomsoever has dwelt beside it. The great extent of the shore makes whatever privacy may be desired attainable; you can have the scene to yourself, or you may share it with a group of tent-folk, or you may, as I have said, congregate with Fashion at the north end.

Our cabin stands within thirty steps of the water, and tall pines overshadow it; at morning the surface is calm and the rising sun delineates every furrow and feature of the mountains opposite, and paints them with delicate colors; all day the breeze blows with the freshness of the sky unsullied by earth; at evening there is the splendor of sunset, and the sinking sun marks his path across the waves. Later, lights begin to brighten along the beaches—lights of cabins, and the red glow of bonfires fed from the limbs and fragments of fallen or moldering trees.

The air cools rapidly, and the breeze dies, and silence settles upon all, except for the remote tinkle of cowbells as the herds come slowly home to the milking.

The essential simplicity and beauty of life are revealed here. We have journeyed far from it during our few thousand years, but from this vantage-ground we can estimate the worth or worthlessness of our achievements. Forest, lake and mountain receive us back to their society with a stately indifference, behind which, however, we can feel a profound friendliness.

A man passed by here this morning, and stopped to chat for an hour. He was born beside the lake and lived here till his boyhood was past; then he went forth, saying to himself that he hoped never to revisit it. But every year since then he has come back; he has traveled the world and prospered, but nowhere had he found what met his inmost need as Tahoe does.

There is a moral in his story.

# Thanksgiving at Antioch College

By ELEANOR LEWIS

IN NOVEMBER of 1853 two gaunt buildings, a recitation hall and a girls' dormitory, both unfinished, represented Antioch College. Its twenty acres were unfenced and pigs wandered through them at their own sweet will; the dormitory doors were not in place, and the pigs sauntered, if they liked, into the dining room; the paths between and around the buildings were ungraveled and trodden into muddy slush; the teachers and students exercised admirable gymnastic powers in evading or jumping over the deep puddles, and even the Honorable Horace Mann, who had declined the governorship of Massachusetts to take charge of this inchoate seat of education, was seen to gather his coat tails in one hand, several books in the other, and take a flying leap to safety over some three feet of ankle-deep mud. It is remembered, too, that on another occasion he stepped on what seemed to be a large stone midway in a puddle, when the stone squealed, gave a preliminary heave which sent the president scurrying across, and rose to its feet as a large hog. The outward circumstances of the college spelled absolute disillusionment; there was trouble within as well as without; there was no endowment fund, and all money for "carrying on" had to be raised before bills could be paid. Even the glory of the autumn forests which had lent a brief charm to the scene passed with unwonted swiftness, and chill November succeeded October. And presently, in the midst of the gloom, came our national day of Thanksgiving.

What had poor unfinished bankrupt little Antioch to be thankful for? A great deal, thought Horace Mann—a deathless ideal! a vision of "one increasing purpose" to be striven for and, measurably, achieved at this crude little western school with its almost comic opera setting, its grim poverty and its glorious if sometimes tragic youth—the vision of an education which should combine sweetness and light, breadth of culture with spiritual insight!

Meanwhile, there was dinner! and here at least was solid ground for thanksgiving—so says our informant, a lady now ninety-one years of age, who was a student at Antioch from its opening until shortly before Mr. Mann's death. It was bitterly cold—she remembers that, as also that around the dinner tables were gathered the president and his family, including Miss Elizabeth Peabody, the famous kindergartner (Mrs. Mann's sister), and all the students who were not at nearby homes. As to the menu, probably the usual "fixin's" were present, but the only viand our informant is sure of was turkey, and this because of a remark from the president's 5-year-old son. He was a mischievous youngling, she says, and spoke his mind at all times with perfect abandon. Now, planting his small hands in his small pockets, he surveyed the loaded tables rather sourly: "Huh!" "I'd rather have a slice of ham than all that tuhkey!"

When dinner was over, Mr. Mann addressed his guests briefly but cheerily, saying among other things that he felt specially thankful to see these young men and women gathered around him here, and to know that the great doors of opportunity had opened for them all—a subject of thankfulness not only today but forever.

Some thirty years later Edward Everett Hale was on one of his frequent visits to the college, and as usual a group of students soon surrounded him, eagerly listening and occasionally questioning. He told us delightful stories—one of them a conundrum: "Why is a cat like the Athanasian Creed?" After due pause (for many of us had never heard of the Creed) he was obliged to answer it for us: "Because of the Damnation Clause (claws)." Then, as our laughter died away and we grew more serious, he said—and the words were never to be forgotten—

"I wonder if, as this Thanksgiving Day draws near, you, like myself, have ever tried to realize how much there is in the world to be thankful for, not merely our own personal blessings, but those greater ones which are almost as unrealized, ordinarily, as the air we breathe. We are all of us still in bonds of some sort—perhaps we always shall be—but do we realize how many evil bonds have been broken? We can gently jest today about the outworn creed of infant damnation, for the bond of that awful belief is broken. We are not afraid of God today;—do we not feel enfolding us the mantle of his love? He is no longer a terrible Judge—but the eternal spirit of goodness and truth and beauty."

He broke off, and we mutely watched him as he sat there, his head thrown back a little, and his dreamy gaze envisioning divine possibilities. Then he became practical all at once, and surveyed us rather humorously:

"It seems I must always get in a sermon," said he, as he rose to go.

There are three dormitories now; there is a "Horace Mann Memorial Library" marking the great president's last home, and daily growing in usefulness through the gift from the Carnegie Foundation; there are six hundred students, fine-spirited, eager-hearted youngsters, to carry on Antioch's noble tradition of service—"BE ASHAMED TO DIE BEFORE YOU HAVE WON SOME VICTORY FOR HUMANITY."

# "An Old-Fashioned Winter" The Goosebones' Prophecy

¶ WITH the first feel of crisp November mornings, folks begin to have concern about the weather. The corner-stove forecasters, who haven't missed a season in thirty years, flash into the limelight to deliver their several prognostications. From various "signs" these "nature students" may predict a mild winter, but they generally foresee a "hard" one; forecasts of a severe winter get more attention than the other sort.

¶ MAYBE the squirrels stored an unusually large supply of nuts and acorns—indication that the squirrels had received advance notice of a long hard winter. Possibly heavy rains had filled the ponds causing muskrats to build their houses large and high out of the water—large muskrat houses are an old Indian sign of a hard winter. Mayhap the birds begin their southern flight a little earlier than usual. Or—well there are numerous "signs" that indicate the character of approaching weather.

¶ HAVING obtained the desired publicity, the forecasters think little more about the matter unless a severe cold wave occurs. In this event, if the cold prevails three or four days, and all preceding mild conditions have been forgotten, they come again to the front. "Didn't I tell you it was going to be a corker?"

Said forecasters are often referred to as "goose-boners," but the goosebone is losing hold generally on the reading public, and the proper thing now is to be a "nature student" (whatever that may imply).

¶ BUT what about the old-fashioned winter, the kind we can all remember, the kind we are forever expecting but the kind we never seem to get any more? Is our climate moderating or are we mistaken about it after all, and is the old-fashioned winter a product of our imagination?

¶ THE facts in the case are displayed in United States Weather Bureau records for the past 50 years, covering conditions for several places in this country. Other accounts go back many years beyond this. They show that climatic conditions may vary within short distances, but that the various parts of the country are constant in their relations to one another.

¶ THE winter mean temperature at Philadelphia, for example, by decades during the last century exhibits remarkable uniformity. Considering individual months, the extremes are found fairly well distributed. In the final analysis there is little to encourage the belief that our winters are moderating. The idea is chiefly due to better living conditions.

¶ OUR memories are impressed chiefly by unusual events. We remember the severe storms and the unusual periods of heat and cold, while moderate conditions are soon forgotten. We remember the times when, as boys and girls, we got out after a heavy storm and wallowed in the snowdrifts, or tunneled under them, but we do not remember the conditions during the rest of the winter. We sum up events that we remember and conclude that "it is a long time since we had a real old-fashioned winter."

POLITICAL economy is not itself a science, but a system of conduct founded on the Sciences, and impossible except under certain conditions of moral culture. Which is only to say that industry, frugality, and discretion—the three foundations of economy—are moral qualities, and cannot be attained without moral discipline: a flat truism, the reader may think, thus stated; yet a truism which is denied both vociferously, and in all endeavor, by the entire populace of Europe, who are at present hopeful of obtaining wealth by tricks of trade, without industry.—*John Ruskin.*

CHRONICLER OF THE NEGLECTED TRUTH

# *Never Again!*

A machine called the Spinning Jenny was invented 161 years ago. Then for the first time a great occupation, textile-making, began to go from a home-work basis to a factory-production basis.

History terms this the industrial revolution. The machine age dawned. Never again could the old methods of the spinning wheel compete.

A far-reaching industrial revolution is on now, too. Age-old wastes in production and transportation are being eliminated by the ever-increasing use of Timken Bearings. Never again can some of the biggest old items of production and operating costs be fully justified.

To-day in electric motors Timken Bearings offer manufacturers cheaper, most reliable power. In shaft hangers and pillow blocks Timken Bearings conserve the power on its way to work. In all varieties of machine tools and other shop equipment Timken Bearings speed the output and better it, while lightening the load, and saving lubricant. In modern transportation—witness the various types of motor vehicles—Timken Tapered Roller Bearings also increase speed and capacity while they are reducing power and maintenance costs.

Timken economies are to be credited to extreme load capacity, great freedom from friction, as well as to fine Timken-made special bearing steel.

Available in the products of so many big, established, highly reputed machine tool and equipment builders, Timken Bearings loom large before every manufacturer who has a progressive policy.

Change of Address

1. Notify us at least two weeks in advance. 2. Give both old and new address. 3. Write clearly.
Entered as Second-Class Matter at the Post Office at Dearborn, Mich., under the Act of March 3, 1879. Additional entry at Chicago, Ill.

# Presented in This Issue:

Mr. Ford's Page this week is on the proposal that all industrial economies should be used to raise wages.

---

This issue of THE DEARBORN INDEPENDENT is largely about books and bookmen. But that does not mean that it is "bookish." Not at all. It is entirely human. Look at the People who form its main subjects.

---

O. Henry at midnight, on a bench in Union Square, New York, making a pencil sketch of a tramp. And he did it so well that the man immediately recognized the likeness. O. Henry's editor continues in this article his delightfully intimate reminiscences of the great story-teller. (p. 3)

---

Homer Croy says that in many ways people are like apples. People can be sorted out under certain varieties, and put into their own particular bins and boxes. But do you know how to do it? As a novelist, Mr. Croy has classified many characters, and he says that some of our common ways of doing it—like making deductions from "a shifty eye"—are wrong. (p. 4)

---

Where is "The House of the Seven Gables"? Nobody seems to know. The son of Nathaniel Hawthorne scouts the idea that the house so-called in Salem is the one his illustrious father had in mind. Here in a charming way Julian Hawthorne tells as much as will ever be known of the origin and growth of one of America's greatest literary masterpieces. Imagine hearing Hawthorne read from his own manuscripts. (p. 5)

---

How much of American reading (not literature) comes to us via Ellis Island? A very great deal. The names that appear in numbers in any fiction counter are distinctly alien, and the contents of their books very much more so. Americans read on in blissful unconsciousness of what is being done to their views. If they were loyal to their traditions they would drink less freely from these wells of English very much defiled. (p. 8)

---

In Chats with Office Callers this week we are given some vivid bits of information by the Army Surgeon about his work on the field of battle. The Man From Hawaii also talks about the "Japanese Supremacy" myth in that delectable part of the earth. (p. 12)

---

Thomas à Kempis defines happiness as being seated in a quiet corner with a good book. This is what Gaius Glenn Atkins means by "Chimney-Corner Books." His article has a rich and mellow literary flavor and points to shelves that contain just the right kind of reading to enjoy "over a pipe," as Charles Lamb puts it. There is not only entertainment, but much that only a literary connoisseur can give in this contribution. (p. 13)

---

Who can tell what it means to be a writer, save one who has written and is still writing? Thomas Masson has not only made books, but has met many others who are in the same business. He has a store of information about how much the job is worth. One popular writer earns as much as $100,000 a year and "employs nineteen servants" in his house. But there are others who—have fewer servants. All writers do not die rich, nor live in plenty. And it is nothing against their quality, either. (p. 16)

---

A novelist who does not believe in plots and never uses them! That is Sherwood Anderson, if novelist he can be called. There is much discussion as to his rating in the world of art, but there is one thing distinctly in his favor, he has no theories about "Art." All that he is aware of is a pressure to tell life as he feels it—and he feels some aspects of it very keenly. Personality, not plots, is his prepossession. (p. 19)

---

There are two ways to tell a story, by pictures, and by print. The picture method is the most ancient, as old as the world itself. Wood engraving was brought to a high state of perfection by medieval craftsmen and carried by a line of skillful artists down to our own day. Much history is contained in these incised lines, of which the illustrations to this article include some excellent specimens. (p. 20)

---

The magic of old books, and the magic of an old bookshop! There is a big flourishing bookshop in the City of New York today which was built up from a primitive news stand at a street corner. Such men as Emerson, Lowell, Dickens and Thackeray have been attracted to this old literary emporium of literature, and have browsed among its shelves. Courtenay Savage conveys to us the atmosphere of this haunt of book lovers. (p. 24)

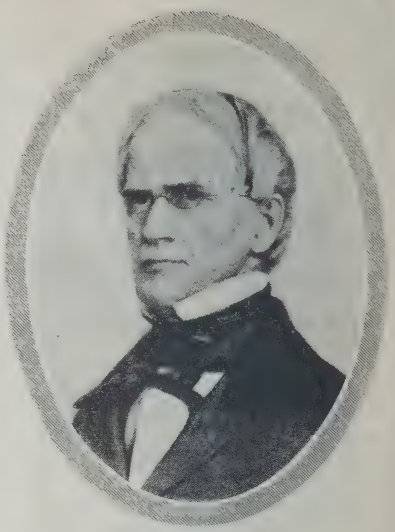
### EDITORIAL NOTE

We desire to state that the article entitled "Mrs. Whitman Tells Her Story" in THE DEARBORN INDEPENDENT of October 3, 1925, was based upon extracts from Mrs. Whitman's letters, and that the letters from which these extracts were taken had appeared in *The Yale Review* of the preceding July. *The Yale Review* thus holds the copyright on the Whitman letters.

# Seventy-five Years of an Ideal—Antioch College

By ELEANOR LEWIS

IN THE far-away fifties an aunt of the writer was a student at Antioch College, under the presidency of Horace Mann, and from her have been derived many anecdotes and reminiscences of that period. She recalled vividly Mr. Mann's stately, somewhat formal presence, the penetrating keenness of his glance, his sarcastic treatment of wilful offenders, his instant kindness to those in need or trouble, and, above all, the impression of deep moral earnestness which one could not be near him without feeling. By many he was thought to be too stern, too rigid in his enforcement of rules and discipline. This may have been true, but, on the other hand, Antioch began as an experiment, and any misstep might lead to the failure its critics predicted. Mr. Mann felt that upon the character and conduct of his students rested largely the success of the experiment.



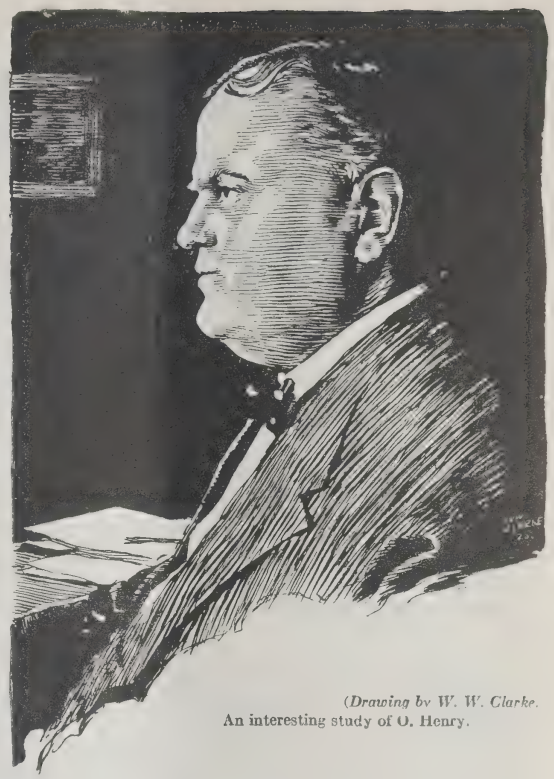
Those were the days of "Abolition," of "Non-Sectarianism," of "Women's Rights," and of "Co-Education"—splendid humanitarian efforts which carried with them, then as ever, the defects of their qualities. Then as ever, the golden mean was less easily obtainable than the extremes. Keeping step with the sane reformer went the unbalanced enthusiast, the "crank," and the reform was more often judged by these erratic ones than by its more level-headed exponents. When Horace Mann accepted the presidency of Antioch College, in 1853, he became the first of a distinguished line of men and women with high ideals of life and human accomplishment, which they hoped to see realized in the newly founded school. Antioch was a close second to Oberlin in coeducation; she was the first to open her doors to all races and colors; she emphasized a "deeply religious but unsectarian training"; and she was so profoundly antislavery as almost to be obliged to close when the Civil War broke out—so many of her teachers and young men answered the call to arms.

Henry Holt, in his *Garrulities of an Octogenarian Editor*, says, "There is a story of some small western institutions where all hands, teachers and students alike, went to the war; but if the story is true, probably they all went to free the slaves." The story certainly is true of Antioch; the college proper was closed, and only a small preparatory school was maintained for several years. She still cherishes the memory of her sons who lived and died for freedom in that war: of Professor (1st Lieutenant) Bardwell, and Dr. Warriner; of Lieutenant Hirst, of T. B. Burkholder, for whom the Burkholder Post of Veterans was named, and of whom it was said, "There was nothing the boys would not have dared or done for him"; of Majors Hamilton and Crapoe, of Marion Ross and many others. Some lived, others died, and a few returned to Antioch after the close of the war. The most tragic fate was that of young Ross, who, as one of "Andrew's Raiders," was hanged for his share in that brave but abortive venture. An escaped comrade wrote of him: "He was the firmest of us all. 'Tell them at home,' he said, 'if any of you escape, that I died for my country and did not regret it.'"

Portion of a letter written in 1857 by Horace Mann.

In this connection I may quote from an interesting letter written to President Morgan by Ross' classmate and friend, the Reverend Edgar A. Hamilton: "The brief period of my student life at Antioch," he says, "was for me impressive, of vivid memory and of deep influence upon my future career through the favor and grace of Horace Mann, whose fine influence with youth led my friends to send me there. The hour was tense with national issues, carrying us along as upon a floodtide. President Lincoln's first call for troops in April met with a ready response. Before sunset of that first day, sixteen members of the preparatory class threw down their books and marched to the front, incited largely by my lamented friend, Marion Ross. He often studied with Major Crapoe and myself, and when I was ill in a hospital at Washington he visited me. His tragic death was told me by one of his prison comrades, when I almost lost self-command under the recital of his treatment and death."

Horace Mann.



Although moral earnestness marked strongly the early Antioch, there was also a very human and youthful reaction from it in some ways. My aunt's recollections included a student described by his fellows as "all right but cranky," who cleverly Latinized his name of John Wesley Eddy into Johannes Hesperus Vortex, and who insisted upon wearing white clothes in winter, in order, as he explained, "to be in harmony with nature." Asked why he did not on the same principle wear green clothes in summer, he replied that one must draw the line somewhere, and he drew it at green!

(Concluded on page 33)

# O. Henry in Light and Shadow

## A Study of the Author, From Life

By WILLIAM GRIFFITH

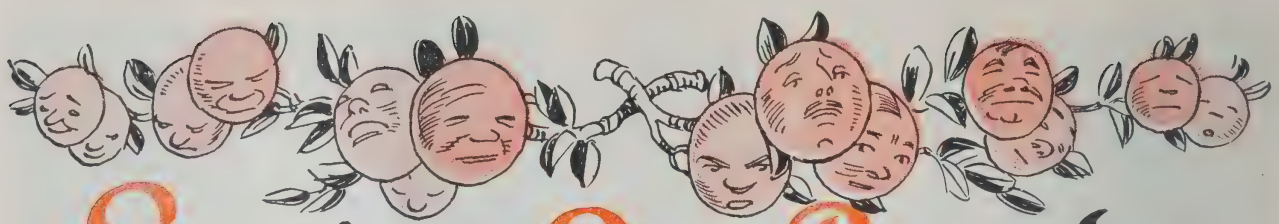
(*Drawing by W. W. Clarke.*
An interesting study of O. Henry.

O. HENRY was not a great reader of books—was in no sense of the word a scholar—and so far as my observation went, during the last three or four years of his life, most of his reading was confined to periodicals and newspapers. All the more interesting was it to hear him say casually one day that for several years he had never failed annually to reread everything that Guy de Maupassant had written and everything that Joseph Conrad had published. His admiration for both these writers was profound, and he once remarked whimsically that he would rather hear Conrad repeat that "humanity is divided into two classes of people, those who burn and those who rot," than to shake hands with Roosevelt.

In perusing newspapers, he evidenced the keenest interest in the cartoons, the merits or demerits of which either evoked his praise or provoked his scathing criticism. Much of his own word-craftsmanship partook of the nature of cartooning and, indeed, O. Henry, as a young man in Texas, where he edited, wrote, published and illustrated *The Rolling Stone*, exhibited a very considerable pictorial talent. The Houston (Texas) *Post*, on which he was once a staff writer and illustrator, stated editorially at the time of his death that "As a cartoonist, Porter would have made a mark equal to that which he attained as a writer, had he developed his genius for it; but he disliked the drudgery connected with drawing and found that his sketches were generally spoiled by anyone else who took them to finish."

In the early days he illustrated many of his stories. However, it was before the present development of the art of illustration, and he did most of his work on chalk, in which the drawing was made, a cast of lead being afterward made with more or less general results of reproducing the drawing in the shape of printing. The generality of the result was at times disheartening to the artist, and Porter never improved upon his natural knack of embodying his brilliant ideas in drawings.

Scene familiar to O. Henry—near the Bowery Mission, whence this author drew many of his characters.



His ability as a draftsman was amusingly illustrated one night in Union Square, New York, to which we had adjourned after an hour or two spent in the neighborhood bowling alley. Seated near us was another bench occupant, considerably battered and tousled by the gales of the underworld. Producing pencil and paper from his pocket, O. Henry proceeded surreptitiously to make a sketch of the fellow. The picture done to his satisfaction, he suggested that we take a stroll around the fountain. Returning to where we had been seated, my companion stopped in front of the bench-warmer and, exhibiting his sketch, inquired mysteriously, "Do you recognize him?"

"Hully gee, 'tis me twin brother!" exclaimed the fellow. "And did ye know Mike Morley yure own silf?"

To the study of metropolitan denizens and moods and manifestations O. Henry brought the genial and generous curiosity of a modern Harun-al-Rashid. He prowled the town, with or without a companion. The "Big Canyons of the Money Grubbing Tribe," as he termed the section of towering skyscrapers at the lower end of the city, Fifth Avenue or First avenue, Broadway or the Bowery, Corlears Hook Park or Gramercy Square; no matter what the locality or the social practice of its residents, it was always Bagdad to O. Henry.

In masquerade the streets, bazaars and walled houses of the occidental city of romance were filled with the same kind of people that interested Haroun in his golden prime. Clothes might be different, but beneath them men and women were unchanged. He sat listening in the shop of Fitbad the Tailor; he saw the Little Hunchback, Sinbad the Sailor, the one-eyed Calendars, the Barber and his Six Brothers and Ali Baba and the Forty Thieves on every block.

A favorite field of his was the Big Store with its humming activity. He knew the ache in the heart of the tired little girl working behind the counter; her dreams and her aspirations. "The Little Shopgirl's Knight," Vachel Lindsay once called him. Who among the millions of O. Henry readers has ever quite forgotten Dulcie of *An Unfinished Story*, who held true to her idealization of Lord Kitchener; or Hilda of *The Third Ingredient;* or Mazie of *A Lickpenny Lover*, who, when the millionaire suitor for her hand (*Continued on page 27*

# Sorting Out People

## People Are Like Apples—There Are Not Two in the World Exactly Alike

By HOMER CROY

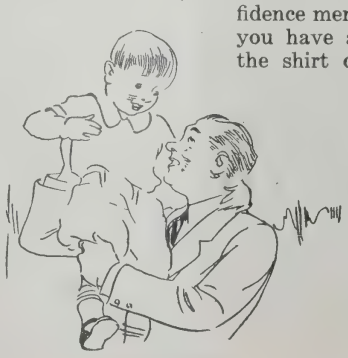
ILLUSTRATED BY RUSSEL H. LEGGE

MANY persons have a calculating slide rule for reading character—little catch phrases and old wives' tales that they think turn a character inside out at a glance. Don't put your faith in these slide rules. They can't bend around corners.

Here are some of them:

"The handshaker."

*The Warm Handshake:* They think that if a person gives you a warm handshake he is as honest as Lincoln, but don't be misled by it. Nearly everybody knows this handshake dodge and crooks and money-borrowing acquaintances especially are onto it. They can numb you to the elbow and then turn around and cheat you out of your eyeteeth. Yet a lot of people go through the world believing that a warm handshake is simply plumbing the depths of the human soul.



There is nothing to it. Some of the best and kindest people I know have a handshake that would make a frosty iron pump-handle seem like a warming pan. It all depends on the individual; it's a matter of temperament and has no more to do with character qualities than it has with the tides in the Bay of Fundy. Don't pin your faith on a handshake. Go deeper.

*If a Man Likes Children He Can't Be Bad:* It is a lovely sounding sentiment, but unfortunately it has nothing to do with a person's character. Some people are nervous and children worry them, and some simply can't unbend to a child's point of view. Much depends if they have known children in their own boyhood or girlhood. I can conceive of burglars being especially fond of children.

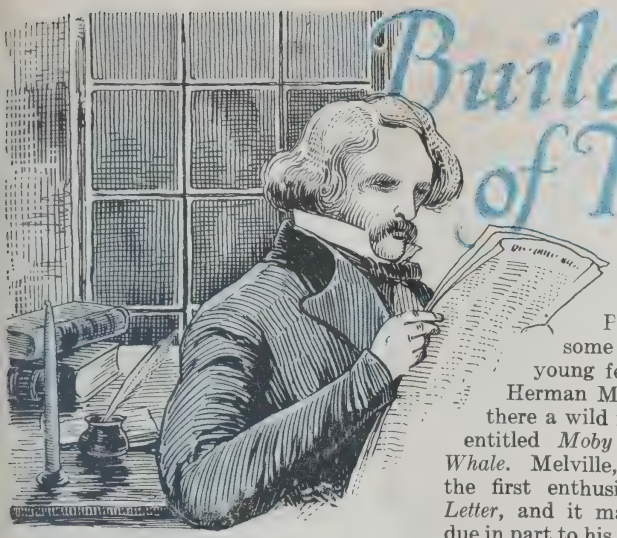
*If a Person Has a Shifty Eye He Can't Be Depended On:* This is a deep-laid conviction in many settled souls and they get a lot of satisfaction out of it, but it means little. The so-called "shifty eye" may be a matter of personal temperament; a person might not look Mr. A. in the eye and then turn around and stare Mr. B. out of countenance. Panhandlers and confidence men can look you in the eye till you have astigmatism and then steal the shirt off your back. About the only thing that a wandering eye indicates, on a first meeting, is that the owner is uneasy in his present surroundings, not sure of himself, or is slightly bored. Usually it is a temperamental sign, not a character quality.

"Shifty eyes."

"Likes children."

I look upon people as apples—there are no two in all the world *exactly* alike, but they fall into divisions and varieties and can be sorted out and put into bins and boxes. There is the Jonathan box, the Golden Grimes box, the Early Harvest box, and so on, clear down to crab apples. And there are a lot of crab apples in the human nature cellar, too.

Here are some of the boxes to drop your apples into when you sort them out:



"Money grubber."

*The Money Grubber:* He wants money, or what represents money; it is his *dominant interest* and he goes after it tooth and nail. He is the rich man of the town; he has the big house with the cupola on it; there is always an outstanding one in every community. From the day he traded his first jackknife he has had his life set on making money—he has lived for it and he will die for it. Often there are specks on him.

*The Idea Man:* Naturally he desires money—that is, food and shelter—but it isn't the main driving force in his life. The biggest thing in his life isn't to get another half per cent out of a mortgage. His chief interest is in ideas, in things that he can't put his hands on. You find him in the lawyer, the doctor, the preacher, the priest, the professor. He likes politics, he is interested in the cause of war, in history, in the development of Man; he spends more time reading, more time thinking of non-money-making pursuits. He never makes as much money as the money grubber, he leads just as happy a life and is just as useful a member of the community.

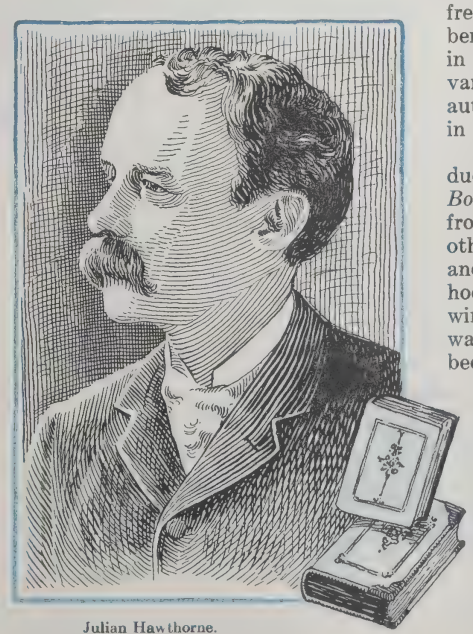
The author of "*The House of the Seven Gables.*"

# Building "The House of The Seven Gables"

By JULIAN HAWTHORNE

AFTER *The Scarlet Letter* was off the press, and the first small edition was being followed by numberless others, as fast as the pressmen could feed paper into the machine, Hawthorne turned his back on the dingy old Mall street house, and on Salem, forever, and went westward, though not beyond the boundaries of his native state. He halted among the Berkshire Hills; and he could hardly have done better.

Had he gone on to the Yosemite Valley, for instance, he would have found it less conducive to imaginative writing. Such stupendous scenery disturbs the beholder's serenity, and distracts his thoughts; it compels attention to itself; it is tyrannical. Nature stares him out of countenance and alienates him from his fellow creatures, their comedy, tragedy and manners. The best he can do is to attempt to describe what he sees around him; and he soon finds that to be a losing game. What is the use of likening the Grand Cañon of the Colorado to the Last Sunset lying in the Crack of Doom? Language is not competent to such enterprises; the greater the noise of the words, the less do we see the thing about which they are shouting. But words rightly used may awaken memory, stimulate thought, touch emotion, and, best of all, because it includes all, kindle imagination. Genius is at its best in suggestion; if it cannot make you coöperate with its effort, it loses its labor. Without sympathy the page is blank, the canvas or the statue insignificant, and the artist no better than a mechanic.



I don't know that the Yosemite and the Grand Cañon were known in the year 1850, unless to a few Forty-Niners, who were more concerned to make material for art than to create it. Even Berkshire wasn't at that time a fashionable summering-place; a few Yankee farmers dwelt here and there in their weather-beaten old frame-houses, and hoed their crops and milked their cattle. There was the town of Pittsfield, to be sure, some miles away, and a young fellow by the name of Herman Melville was composing there a wild romance of the ocean, entitled *Moby Dick, or the White Whale*. Melville, however, was among the first enthusiasts for *The Scarlet Letter*, and it may have been due in part to his urging that Hawthorne turned in that direction. But the deciding influence was no doubt exerted by Mr. Tappan—for some reason we always mentioned him in that style, though he was a most urbane, cordial and cultivated gentleman and never put on any airs. Mr. Tappan, at all events, was an admirer and friend of Hawthorne, and he owned quite a large tract of land, in Berkshire, occupied a handsome house there, and possessed besides a little red cottage on the brow of the hill that overlooked "The Bowl," as the beautiful lake was called that lay at the feet of Greylock and Monument Mountain, opposite. This cottage he offered to rent to Hawthorne on reasonable terms; in fact, the price asked by the year was hardly more than it might have brought by the week, when Lenox became fashionable. It burned down about forty years ago—it wasn't much bigger than a matchbox, and became a cinder in no time.

Mrs. Sophia Peabody Hawthorne.

But the year and more that we spent in the red house at Lenox was delightful and profitable to all concerned. It was the children's first taste of the country, and they thrived and prospered mightily. For Hawthorne, after Salem, it was a new existence, corresponding with the change in his state of mind from the drudgery of the custom house, the anxious and emotional toil of *The Scarlet Letter*, with the slow decline and death of his mother, and the dire lack of money that accompanied these conditions. Sorrow and hardship were past, success and comfort were ahead. And lovely though was the scenery of Lenox, it wasn't so grandiose or sensational as to interfere with the freedom of his imagination; it was benign and cheering; it could be taken in at a glance, and yet had enough variety to avert monotony. And the author had other books awaiting birth in his mind.

He has depicted Lenox in the introductions and interludes of his *Wonder-Book;* he called the place Tanglewood, from the forest of pines, walnuts and other trees that clothed the hillside and much of the rest of the neighborhood. When, after the summer, winter came, we couldn't tell which was the more delightful; and Hawthorne became like a boy again, and was our incomparable playmate, so that we thought the time wasted that he spent in his study overlooking the lake. When, however, he read the stories to us from the manuscript, we could forgive him, but could not understand why he should want to put them on paper, when they were so much more captivating in his living voice and expression. But the days of Homer

Julian Hawthorne.

and of the great improvisatories were gone, and in steps the publisher!

An author may lighten the stress of the book he is writing by thinking of the one he intends to write next. *The House of the Seven Gables* flowed out so easily from Hawthorne's mind—and yet its structure is so compact and its quality so mature; and, withal, it was done in so short a time—that I incline to think that he "saw" the characters and the story pretty completely before ever he wrote Finis to *The Scarlet Letter*. He allowed himself something like a regular novelist's plot, in this instance, and it is a good one. Plot stories are written more easily than are analyses of spiritual insight and interpretation, like *The Scarlet Letter* and *The Marble Faun*.

Hawthorne's usual way was to take some commonplace incident or situation, and to work out its relations with the profound and permanent conditions of life; as a geologist might pick up a pebble and expound from it the structure of the planet. Of course, there is a "moral" in *The Seven Gables:* morals were demanded in the mid-nineteenth century, and indeed no story that doesn't have a moral is a story, or worth writing or reading. My friend George Moore objects to plots and prefers to develop what he calls an anecdote. He read the *Seven Gables,* and was delighted with it till he came to pressing the secret spring which caused the portrait of Governor Pyncheon to start forward in its frame and disclose the deeds to the estate which had been sought in vain for two hundred years: that hurt him cruelly. Much argument, more or less edifying, may be had on this point. But when the dénouement explodes, it causes the reader to glance back through the entire building of the story, and to recognize a moral significance in it, symbolic of the whole course of events. It gives pleasure by justifying, as Milton says, the ways of God to man. No doubt, in real life, we see only such small arcs of the great circle that the far-off returns of reward and punishment are hidden from us. But the human mind, free from time-limitations, can sweep from zenith to nadir in a moment; and it is right in seeking in a work of imagination the satisfactions that are denied to it in a mere notebook of events. It likes to have the end foreseen from the beginning, and prepared for with the story-teller's art, which keeps the secret till the right moment. The less actual mechanism (such as a steel spring) the better, perhaps; but I think George was oversensitive.

Hawthorne at all events seems to have written the *Seven Gables* with a flowing pen, and to have enjoyed writing it. "It was a more natural book for me to write," he himself said, comparing it with the grievous labor-pains of *The Scarlet Letter*. It deals with a human frailty more widespread than the other, and which we therefore regard more leniently. Selfishness, however, is the root of all evil, and generates a peculiarly repulsive sort of villain, as well as many of lesser blackness. And we have no sympathy with a Judge Pyncheon, though Dimmesdale and Hester appeal to our inmost hearts.

It was congenial to Hawthorne, also, to depict the house itself of the tale, and to surround it with the Salem atmosphere. And here I will enlarge

The House of the Seven Gables which Julian Hawthorne asserts is not the original.

for a few moments upon a matter which, despite efforts to the contrary, has been ambiguous for many years.

No sooner was the *Seven Gables* published than Hawthorne was beset with inquiries as to the physical identity of the house which he had described, as well as to who Judge Pyncheon really was, and why the respectable and blameless family whose name was Pyncheon and which lived in Salem, should have been so undesirably pilloried in the narrative.

To the latter queries Hawthorne replied that he had picked out the name of Pyncheon as picturesque and suitable, and in total ignorance of the fact that a family of that designation was still living; and succeeded in placating the disturbed old gentleman who had addressed him on the subject. Otherwise, all the personages of the story were of his own creation; even the wicked Judge himself was as original as his forbear of the seventeenth century, though many people who were acquainted with a certain Mr. Upham, and his activities, persisted in thinking that he must have sat for the portrait.

Perhaps only writers of fiction can understand how fictitious characters are made; and even the maker himself cannot always trace the shreds and patches which may have given him the hints which he half unconsciously combines into the figure. But it is next to impossible to put a real person into a story; he or she isn't plastic enough, but is constantly running foul of the structure; the one destroys the other. Creative imagination requires perfect freedom and, paradoxically, the illusion of reality vanishes the moment real reality is allowed to creep in.

The house itself of the *Seven Gables* remains to be considered. I will quote a paragraph or two from Hawthorne's own preface to the book, which I suppose must have been written after the first edition of the story had appeared, for it seems to be in the nature of a reply to criticisms or inquiries:

> The house, he writes, was "a specimen of the best and stateliest architecture of a long-past epoch: a little withdrawn from the street, its whole visible exterior ornamented with quaint figures stamped in the glittering plaster, composed of lime, pebbles, and bits of glass, with which the woodwork of the walls was overspread. On every side the seven gables pointed sharply toward the sky, and presented the aspect of a whole sisterhood of edifices, breathing through the spiracles of one great chimney. The many lattices with their small diamond-shaped panes, admitted the light into hall and chamber while nevertheless the second story, projecting far over the base, and itself retiring beneath the third, threw a shadowy and thoughtful gloom over the lower rooms. Carved globes of wood were affixed under the jutting stories. The principal entrance, which had almost the breadth of a church-door, was in the angle between the two front gables, and was covered by an open porch, with benches beneath its shelter. Under this arched doorway . . . " and so on.

No clearer picture than this could be more concisely drawn of an object conceived to its last detail in the writer's mind. The house stands before us like a massive and tall tower of the Middle Ages, overhanging its base, and even suggesting by its coating of glittering plaster the solid stone of which its English equivalent would be constructed. It is compact, not spread abroad, done with a single motive, not added to from time to time by the taste or needs of subsequent generations, and the great central chimney completes its unity.

The gables point heavenward with a sort of symmetry, relieving the heaviness of the main building, and the sheen of the diamond window-panes, and the sparkle of the plaster overspreading the walls, lighten the gloom. It is all a symbol of ambition, pride and hypocrisy and the keynote of the romance. And as if to clinch the matter, its architect adds, "He trusts not to be considered as unpardonably offending, by laying out a street that infringes upon nobody's private rights, and appropriating a lot of land which had no visible owner, and building a house of materials long in use for constructing castles in the air."

All this seems explicit and categorical enough. But persons resolved not to see or hear are blinder than statues and deafer than the adder. The denial or delusion upon which they are resolved is dearer to them than the reality, and they transmit it to their posterity, its virus augmenting year by year, till at length it takes actual form in concrete wood and brick, its component parts labeled, with a *vade mecum* to guide the visitor from room to room, with photographs (at a price) of every detail and even with copies of the romance itself, profusely illustrated, and graced with an introduction by the hand of some lady—I forget her name—explaining copiously how and why that which is not, nevertheless is!

In short, a house with seven gables has been torn down from the sky of Hawthorne's imagination, and forced to masquerade in the substance of a sad and sprawling old building on a certain Salem street: a thing which began life as a two-ended, five-roomed domicile for some unpretending family, and had been added to from age to age to meet the requirements of various inheritors, till at last it presents itself to us a forlorn, amorphous agglomeration, which at no period of its casual existence could have offered the remotest likeness to the dignified and patrician structure which Hawthorne built in his little study in Lenox.

Yes, this is declared to be the only true and original House of the Seven Gables; and the wondering stranger is welcomed by a bevy of ladies, presumably in the employ of persons "higher up," as we say. The whole concoction is one of the curiosities of—not literature exactly, but—let us say, impersonation. After inspecting it, one is not encouraged to read the book; for how could a readable romance be written around a contraption so ungainly and vulgar?

I myself visited the affair some years ago, was greeted by the guardian nymphs, listened to their patter, wandered through the rooms, was shown into the garden, and almost expected to be confronted with the brood of Lilliput hens which figure in the story, or at least with the black cat which watches for Judge Pyncheon's soul. I was introduced to a stuffed easy-chair, however, and was preparing myself for the information that it was the identical chair in which the Judge sat down to await the appearance of Clifford. But, no; this was "Hawthorne's Chair;" and it was explained that Hawthorne was wont to occupy it while revolving the scenes of the story-to-be in his mind. Inasmuch as Hawthorne never visited the house after his fourth or fifth year, when it was occupied by two old ladies, relatives of his family, the chair seemed overlarge and in remarkably good repair.

The house has seven gables, however; indeed, there were eight, but the revisory committee suppressed the supernumerary one. There is also a secret staircase: none is mentioned in the story, but the committee, considering the problem of how Clifford appears inexplicably in one of the passages of the narrative, deftly availed themselves of an otherwise uncalled-for little flight of stairs which Hawthorne had omitted to mention. The house not only possesses a chimney, but two of them for good measure, neither, however, in the right place; for no "central" chimney is possible in an edifice which has no center to put it in. But enough of this desperate inventory! The committee deserves credit for the imagination which could see in this what Hawthorne had called "a specimen of the best architecture of a past epoch."

The question, Had the house any prototype? was often put to Hawthorne himself during his lifetime; he always replied with an emphatic No!

---

With all respect to Colonel Mitchell, he is not the Army and Navy of the United States. Yet his utterances are given columns, pages, reams of publicity, where official Army and Navy utterances are wholly suppressed. It is not fair. It is exceedingly bad public policy. A nation trained to suspect its Army and Navy will just as quickly suspect Mitchell, were he our war lord.

In view of the widespread and complete suppression by the American press of the facts which responsible and representative Army and Navy officials have to give, THE DEARBORN INDEPENDENT has decided to redress the balance as far as possible by letting Americans read what their defense representatives have to say *at first hand*.

This does not indicate a policy favoring Army and Navy contentions against Mitchell contentions in the present controversy. It indicates our belief that no controversy is fair or American that does not give the people the whole truth on both sides.

Next week we shall begin to print various articles on the question of airplanes in the American defense scheme.

---

# Going to Church in Samoa

"GO TO church Sunday" campaigns, considered so necessary in America and other lands, are among the nonessentials for churchmen in American Samoa. How to increase the percentage of the population ranked as church members and how to make the members regular attendants at services are problems that vex the minds and weary the souls of many ardent church leaders of many denominations in many lands. Not so in Samoa.

Latest official figures give the population of American Samoa as 8,058 and the church membership as 8,093, which, on the surface, has 100 per cent beaten. However, the population figure is that of the 1920 census and the church figure is of April, 1921, date. Thus time is allowed for the population to have increased by 35, enough to make the church figure a genuine hundred-per-cent accomplishment.

The church membership, including men, women and children, as claimed by the various denominations April 1, 1921, was as follows:

| | |
|---|---|
| London Missionary Society | 6,783 |
| Roman Catholic | 860 |
| Wesleyan | 180 |
| Mormon | 270 |
| Total | 8,093 |

The above are the only denominations represented in American Samoa. All the missions there are self-supporting, except that of the Mormons. The Samoans are intensely religious, practically all profess to be Christians, and all go to church, even those who are not ranked as actual church members. There are some in the latter class, despite the 100 per cent figures given above. Every Samoan home has morning and evening prayers and Sunday is strictly observed.

The Samoan also is a generous giver to the church. Not only does he support his home missions, but sends missionaries to many other South Sea Islands and has thousands of dollars awaiting the annual call of the L. M. S. gospel ship. On each of the lesser islands of the Samoan group the largest building is the mission church. Occasionally the jibe is heard that "All fat Samoans are missionaries," but the Samoan only smiles at such remarks.

That success has attended the labors of the missions and their schools is attested by the remark in the latest official report of a governor of the Islands that: "It is said that all Samoans are able to read and to write, but their education is extremely limited, except as to the Bible, with which they are more familiar than is the average American."

# Americanism in Fiction

## Are All Americans Loyal to the American Tradition in What They Read?

By LEWIS WORTHINGTON SMITH

"There is a current tendency to depreciate and discredit the achievements of the Anglo-Saxon in literature."

PERHAPS we shall never quite agree among ourselves, whether critics or readers, as to the measure of departure from the literal permissible in fiction. The question comes violently to the fore as we enter the world of realism. There are those who cannot distinguish between realism and literalism. The tendency of the non-esthetic mind is to push realism into literalism, to insist that the poet shall be no more than a newspaper paragrapher, that the writer of fiction shall deal with facts as coldly as a historian, shall penetrate into their inner meaning and vitalize them no more than a drudging chronicler. Artists know that literalism is the death of art. Thinkers know that it is the death of everything but formalism in thought.

The question of the distinction between realism and literalism is one of growing importance. Any reasonably wide reading of current fiction will make it convincingly clear that many of our novelists have ceased to be artists, if they were ever entitled to that designation, and have become reporters on the assignment to police headquarters. They have become literalists, and they are reporting only what they see with their eyes on the ground. That men are creatures with legs and eyes and ears, with mouths and appetites, they know. That they are also creatures with purposes, that they are capable of making plans for the realization of those purposes, and that they have ideas and constructive visionings, they have not discovered.

Writers and critics who do not have this fuller understanding of what man is cannot deal in any adequate fashion with the empire-building of the great West. There is a current tendency to depreciate and discredit the achievements of the Anglo-Saxon as he is seen by some of those among our aliens whose intellectual riches are of the acquisition of their own generation.

There are a number of terms that should be defined before these alien critics pass judgment. How are we to understand the coloring, the aspect, of actual existence? What is the essential truth? The literal mind, if and when it is capable of recognizing the distinction between fact and truth, does it with some difficulty. Here our critics fall into the entanglements consequent upon that incapacity. It seems to be their conception of fiction that it is really only a transcript of certain selected portions of fact. Their literary preconceptions are very much like those of the novice who believes that he has a fortune almost within his grasp because he knows a true story, a real happening, that can be turned into a best-seller.

That it is a true story, that it is something that actually took place, will be its condemnation in the eyes of almost every editor who knows how literature is made.

Certainly a writer who is producing literature should not tie himself to the literal or subject his work to the test of the literal. The creative imagination, the possession of which distinguishes the novelist from the historian, will not have opportunity to exercise itself if it cannot go beyond the literal.

In treating American subjects, however, a writer must be first and foremost a loyal American. Some time ago I heard a naturalized Russian declare in an address that the naturalized alien was just as much an American and just as free to make this country what he wanted it to be as any one. This is not the understanding of any genuine American. Loyalty to the American tradition of decency, of constructive idealism, of hatred for the ugly and the unclean is fundamental to any genuine Americanism. Emerson Hough, a student of the life of the West, is quoted as declaring that it was his ambition to establish such a tradition and as saying, "I don't know that I'll have any success at it, but it's worth trying for." A writer having that spirit and that purpose is fairly certain to be attacked by the alien beneficiaries of our American empire-building. We shall have to endure the affliction of having too many parasites of that sort with us. They have been received at Ellis Island, have washed their faces and have gone through the barren ceremony of swearing allegiance to the Constitution. They then proceed to indoctrinate the American people with ideas that have never reared a civilization, but that have always attacked Anglo-Saxon civilization. That, perhaps, is not surprising: they are but working out their nature. The surprising fact is that Americans so seldom see what it means.

# MR. FORD'S PAGE

THE demand that all extra profits accruing through the economies of management should go to increase wages, has been brought into question. While it has always been agreed by just and progressive men that wages is one of the essential products of business, and that wages cannot be tampered with without hurting business, a demand like this reminds them that there are other things besides wages in the world, and of importance, too.

The cost of living is one of them. In our last week's page we supposed an industry which through efficiency and approved service was able to reduce costs to the consumer. It gave the benefits of its improvements to its customers. If an article cost a dollar less to produce than formerly, a dollar came off the price charged the consumer. By that process more people were enabled to buy the commodity. More buyers made a still larger business. A larger business still further reduced costs, which in turn increased the business still more. And so on.

Now it is obvious that however efficient the idea of economical production in that factory may have been, no such growth would have followed had the economy not been shared with the public. Suppose that the one dollar saved was added to profits, the price to the consumer remaining the same. There would have been no change in the volume of business. Suppose the dollar saved had been added to wages, there would have been no change in the volume of business. The few workmen employed in a small business would have been a very, very little better off, the business itself would not be better off at all, the buying public would not have received a cent of benefit.

But by sharing the profits with the public there was immediate and great public benefit, there was a stimulating reaction on the business, prices went lower, business increased, thousands of men were employed where but scores found work before, wages increased, profits mounted. *By starting at the right end* prices went down, which is to say that, to the public, values went up, wages went up, surplus went up, a general healthful condition prevailed.

The point is, this did not come by doing what is now demanded, turning all the profits into wages. It came by turning the profits into savings for the consumers.

There are more consumers than there are wage-earners. It is accomplishing more benefit for the wage-earner with a family of five, to reduce the cost of necessities for the members of his family, than to increase his pay without reducing his costs. That is, supposing that an increase in pay were possible under those circumstances. Increased pay comes through increased business, and no increase in business is possible except by increased accessibility of goods to the public through decreased prices. So that it is quite idle even to talk of a man having a choice between decreased cost of living and increased wages. There is no such choice. It is neither or both.

> *THE point at which to start the wheel of business going, is with the user or consumer. Make him the prime beneficiary of all the economies in business, and he supplies the motion which does all the rest. To say that labor deserves the big end, or management either, is to favor a principle that will destroy business. The big beneficiary of any business should be the buyer. Labor, as buyer, is therefore also benefited. Whereas, if all the benefit were withheld from the buyer and put into wages, this whole profitable series of increased demand, bigger production and higher wages would never get started at all.*

In the great round of life, labor is more of a buyer than a seller. The point at which to start the wheel a-rolling—the wheel that serves us all and brings the satisfaction of all our physical needs—is the buying end. Make things easy for the plain people to buy. That makes work. That makes wages. That makes surplus for extension and greater service.

The burden of it all seems to be upon the shoulders of management. Labor works along under any system. There is little or no concern in the shop whether the best method is being used, whether the best results are being had from materials or from the motions of men; it is a day's work just the same. The difference in a day's work is in production value, and this is the business of management. The result is that labor is the greater beneficiary, being the gainer in two ways, once by increased wages, once by reduced living costs.

And yet labor does not originate the ideas and methods by which it benefits. This will be denied mostly from a feeling that because of this failure an argument is likely to be made that labor is not entitled to participate in the benefits of these new improvements. That would be an entirely wrong conclusion.

The social truth is that *everybody is entitled to participate in any benefit vouchsafed to the human race.*

That is why the demand that wages alone participate is false to social truth.

## Growing

LAST month 72,701 persons subscribed and paid for the THE DEARBORN INDEPENDENT. These came from all states of the Union, Canada and Europe. It is part of the steady growth of this magazine, accomplished without any of the usual excitement of subscription campaigns. The magazine goes to people who want it for what it is, for the service it renders and for the position it occupies with reference to certain big questions.

THE DEARBORN INDEPENDENT has always emphasized the essential element in public developments of importance. The daily newspaper cannot do that. It is at the mercy of haste, for one thing, and of the intolerable intolerance of all sorts of prejudices for another.

The newspaper is not to be charged with ignorance; at best it chooses not to embroil itself with the local prejudices with which our American communities reek; at the worst it becomes the organ of one or another group of these prejudices. Certainly its readers are not thereby equipped to take broad views based on facts concerning important national tendencies.

However, we are not discounting the newspapers; they have their place and fill it; we are merely saying that something more than the newspaper is necessary if its readers are properly to interpret what they read there.

Thus THE DEARBORN INDEPENDENT does not seek to follow in the lines of other magazines. Why should it? They are filling their places, why duplicate them? It would be much easier to make a popular magazine, one that made no demand upon the mental apparatus of the reader, but such a magazine would not be THE DEARBORN INDEPENDENT. The news stands are filled with magazines in which it would be impossible to find a single statement which challenged a difference in opinion; the only possible challenge they offer is a difference in taste. But reading that does not challenge the mind is of little value.

THE DEARBORN INDEPENDENT is therefore not averse to the thought that there are always readers who, on one point or another, disagree with it. We are glad to have been provocative of thought in them. The worst kind of reading, as a steady diet, is that which never challenges us with a new and significant fact, or with a new angle of view.

## Not Christian Any More

WHEN the Alliance for International Friendship through the Churches arrived in Detroit for its convention, it was Christian; all its purposes were described as Christian; all its motives were called Christian; all its shibboleths were Christian. It left Detroit with an issued order that hereafter the "Christian" should be abolished. This was done upon the protest of a liberal Jewish rabbi, one Leo Franklin, who has never yet been induced or coerced to abolish his special creedal designation on any occasion, nor make the slightest concession from Judaistic demands, as some of the Christian clergy who have dealt with him on matters of intermarriage could testify.

And yet there was a singular propriety in the deletion of "Christian" from all the words and works of this association of pacifists working through the churches. For the movement as at present organized is not specifically Christian. That is, the expression concerning the outlawry of war is the invention of a gentleman named Levinson, who lives in Chicago, and who, though not "Christian," exercises a remarkable influence over the *Christian Century* published there; and its insinuation into the churches is managed by a series of organizations whose directors, and especially secretaries, are anything but Christian, even in name.

It was therefore not as surprising as it might otherwise have been that at the demand of Rabbi Franklin the very distinguished list of Christians (mostly clergymen) making up the officiary should have tamely submitted to blot out their very remote reference to Christ.

It relieves the Christian churches of much embarrassment.

## Radio Regulation

AN INTERESTING experiment in self-government was made in the fourth annual radio conference called by the Department of Commerce. It was an effort by Secretary Hoover to give the radio world the benefit of his central observation of the problems which have grown out of the amazingly rapid development of radio in this country, and to receive in return the counsel of the radio world as to how best these problems may be met.

The conference organized its business much

after the manner of Congress. The various departments and interests of radio were assigned to committees which continuously considered the problems before them and reported their recommendations. This covered the matters of licenses, stations, territories, programs, equipment, and so forth. Yet it was not a congress of those who were interested alone in the financial or publicity departments of radio. We have become too accustomed to special interests legislating for themselves without respect to the public. This radio congress included also "the ultimate consumer," so to speak, the buyer of equipment, the domestic listener-in, and representatives of the small boy. It was instructive to observe how at every step the interests of the juvenile radio fan were conserved. There are many thousands of amateur radio stations in the country, most of them conducted by boys, and their rights as the coming generation were not forgotten.

What effect this will have on the immediate future of radio remains to be seen. One effect which will be noticeable at once was the decision to go slow on broadcasting licenses until there is some mortality among existing stations. There are only 89 possible wave lengths at present and there are 578 broadcasting stations. That spells a traffic jam in the air. Doubtless with improved equipment and regulation all this can be handled in a manner that will not obstruct the fullest development of radio science and practice, and when this is accomplished, the total radio brain of the nation, as brought to bear in these conferences, will have to be credited with the feat.

## *Educational Embroidery*

THE English do not take our educational psychologists very seriously. The psychologists make up for it by taking themselves very seriously. They switch from socialized recitations to project method; from coefficients of correlation to coefficients of coördination; from tests and measurements to curriculum revisions with such chameleon-like naïveté that our laughter becomes rapturous if not positively rupturous.

These experts are humorous to the real teacher who has the spirit of a missionary and a mother in her; to the teacher who knows that standardization is impossible; to the teacher who knows that children are individuals and cannot be card-indexed, cataloged, classified, stamped and numbered. Above all, they are most humorous to the teacher who is able to get under the reserve of the child and reach its soul through love, understanding and appreciation. To such a teacher the rules and formulae, the recipes and postulates, the charting, graphing, testing and measuring are things to talk about at educational conventions but they are also things to smile over while facing a group of "shining morning faces" with little individual souls behind them.

Let the educationists have their words, their phrases, their high-sounding jargon and their theories. While they are amusing themselves in this way we can only hope that most of young America is sitting in front of women who were once children themselves and who are not entirely grown up as yet. Ask some teacher of your acquaintance about this.

## *Tackle the Big Ones*

IT APPEARS to be the general opinion that the League of Nations is to be credited with stopping the incipient war between Greece and Bulgaria. In the minds of the better informed this opinion may be somewhat modified by the knowledge that probably a word or two from certain governmental quarters had a greater efficacy than the League's order.

However, not to detract from the credit that is being given to the League, the event puts it in the position of having to go somewhat further. To retain the credit for having made two very small nations stop their fighting, some movement will have to be made toward inquiry into other wars now progressing—the two wars of France, and the war of Spain. League prestige will grow only when powerful nations are called to account. And this will also be true of the World Court. It will doubtless be employed to settle the difficulties of small nations, but it is quite another thing to call big nations to the bar of judgment. It has not been done. The day it is done, the world will get its first feeling that there is reality behind the talk.

## *The Organist*

A RECENT writer says that he likes to watch an organist at the organ, because that organist does so many things well at the same time.

He watches both keys and pedals; he watches the notes and the words of the music in front of him; he watches the choir as it interprets the music; and then he must watch through the mirrors in front of him to see how the audience is following.

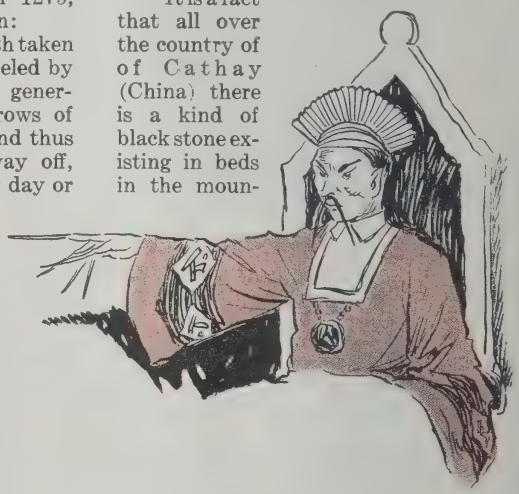
This writer says: "If that Organist had the capacity of God he could play the Universe. For that is exactly what God has to do to be God. He must play the Universe. The Universe is God's full organ, and human lives and human lips are the solo stops."

***The Army Surgeon*** dropped into The Office and conversation soon fell upon surgery in the field. Of course, marvelous things were done in the field hospitals. I asked him why it was so. Well, said he, in the first place there were more marvelous things to do. Every possible kind of thing happened in battle. Private practice would not put before the surgeon in a lifetime what battle was likely to put before him in a day. That's one element. Then, under those conditions, a surgeon will do more daring things, things he has always subconsciously felt could be done but which he doesn't risk doing in private practice. Out on the field, however, where one's patients are several hundred wounded boys—every one of them looking something like your own boy—you will do things that seemed impossible. You become a fighter too—with death. And it was not entirely wisdom; plain *speed* had a lot to do with it. At the beginning of the war we lost 80 per cent of our abdominal cases. To be precise, we saved only 21 of every 100 boys who came to us with abdominal wounds. As the work pushed us and we were forced to work at top speed, we began to save more. In our outfit we got up to 82 per cent. I found that if I could open and close a man inside half an hour, he usually got well; longer exposure of his interior lessened his chances. Speed was a big factor. It was like everything else; no one suspects what he can do until he is up against it. And then, as organization became more perfect, the interval between the casualty and medical attention was greatly decreased. This was another aspect of speed, and it helped beyond measure.

***The Man from Hawaii*** dropped into The Office. We told him about those who had tried to alarm us about "Japanese supremacy" of those islands in another thirty years.

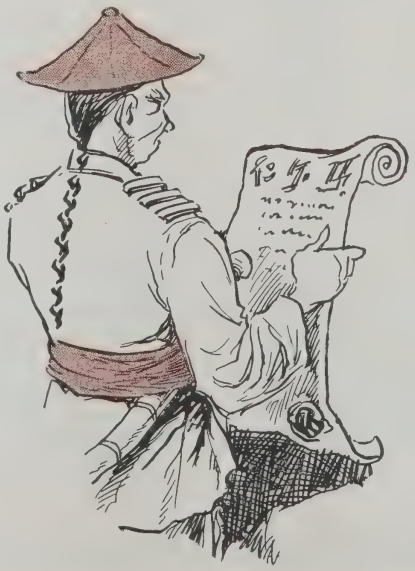
"It will be sooner than that," said he. "In another ten years the Japanese will represent the balance of power in Hawaiian politics. They will be American-born Japs, too. And in twenty years we shall have a Japanese government in the Islands—if the Japs want it, and *if* the United States does not set up a provincial government there. Still, when anyone tells you that the Americans in the Islands are alarmed, you may be sure they don't know what they're talking about. No Japanese politics could be half so bad as Hawaiian politics now are. The Japs couldn't be so bad if they tried. Some of us are looking to the appearance of a Japanese political predominance as our salvation from Hawaiian politics.

"How do the Japs feel about our exclusion of them? Why, they took it as a matter of course, until the United States began to apologize. That is where we let ourselves down in their estimation. Japanese are not fooled about their own people. I don't agree that they are all agents of Japan. They cling closely to their old traditions, but you don't see any of them moving back to Japan. One visit is usually enough for them. The home country doesn't draw them at all. I think that so far as loyalty goes, they can be turned into American citizens. They are bright, but they are not creative. There is no feeling against them in Hawaii, because there they do not come into competition with white labor; but what we shall ultimately do with the large numbers of Japanese we are educating is a question.



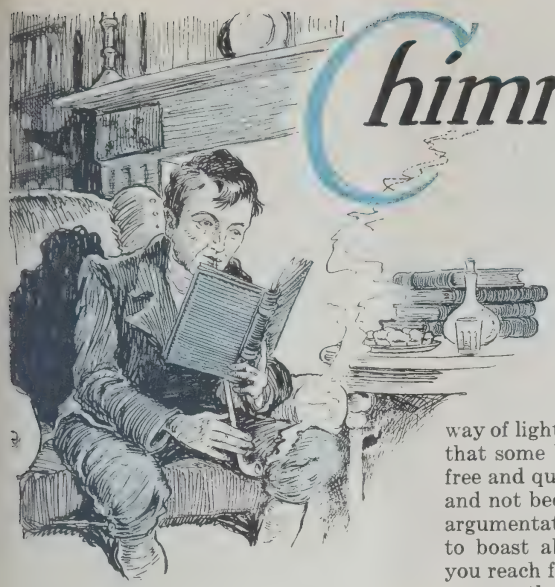
"The Navy visit left us all chuckling. It certainly had all the earmarks of a political show. Still, if it helps the Navy get money from Congress, why kick? But it was funny how the Navy refused to permit Japanese fishermen to go out and find Captain Rodgers and his men. Those sampans could have picked up our naval aviators in no time—but, no! the Navy would not have it be said that Japs rescued Americans.

"Don't be misled about Americans over in Hawaii; they have no problems at all. It is the fellows who come and stay for a day or two who can tell you all about Hawaii's past and future."



# Wisdom of Kublai Khan

THE following descriptive passages are taken from the account dictated by Marco Polo of his experiences in China, which he visited in 1275, during the reign of Kublai Khan:



"The emperor, moreover, hath taken order that all the highways traveled by his messengers and the people generally, should be planted with rows of great trees a few paces apart; and thus the trees are visible a long way off, and no one can miss the way by day or night. Even the roads through uninhabited tracts are thus planted, and it is the greatest possible solace to travelers. And this is done on all the ways where it can be of service. The Great Khan plants these trees all the more readily, because his great astrologers and diviners tell him that he who plants trees lives long.

"It is a fact that all over the country of Cathay (China) there is a kind of black stone existing in beds in the mountains, which they dig out and burn like firewood. If you supply the fire with them at night, and see that they are well kindled, you will find them still alight in the morning; and they make such capital fuel that no other is used throughout the country. It is true that they have plenty of wood also, but they do not burn it, because these stones burn better and cost less.

"Moreover, with that vast number of people and the number of hot baths that they maintain—for every one has such a bath at least three times a week, and in the winter if possible every day, whilst every nobleman and man of wealth has a private bath for his own use—the wood would not suffice for the purpose."

# Chimney Corner Books

## "They Establish Themselves in the Affections of Men and Are Thereafter Nearly Immortal"

By GAIUS GLENN ATKINS

ILLUSTRATED BY WILLIAM H. FREYSE

A BOOK reads the better which is our own, and has been so long known to us that we know the topography of its blots and dog's-ears and can trace the dirt in it to having read it at tea with buttered muffins, or over a pipe, which I think is the maximum." So Charles Lamb, who knew both tea and tobacco and buttered muffins and books, set up a standard which has been generally approved and widely observed, though it may now be taken only for substance of doctrine.

There is, I suppose, no way of proving that the saying "over a pipe" is original with Lamb, but he is more likely to have fathered it than anyone else, and his choice of prepositions is a nice point for the antiquarian. It needs only ordinary observation to see that nobody could nowadays read a book "over" a pipe unless he were hopelessly shortsighted. But Lamb smoked and read in the days of the old church warden with a stem half as long as one's arm. The situation had its inconveniences, a long clay pipestem being as fragile as good resolutions, but it kept things in right proportion. The book came first and My Lady Nicotine supplied only a mellow and fragrant background, a drift of smoke to soften the austerities of the printed page and give the reader some stuff of dreams out of which to build an air castle if the book put him in that state of mind. Nowadays it is the smoke and not the print which gets first in a man's eyes, which is, maybe, symbolic of a deal of modern progress.

I have not quoted Lamb to take out a brief for a church warden or good Virginia leaf. He gave up tobacco himself and, I suppose few things in a sorely tried life cost him more. Nor does he mean to tell you that you must smoke a pipe to like a book, any more than burn down your house to roast a pig. He is just telling in his own rare way of light touch and whimsical humor that some books are to be read for the free and quiet pleasure of reading them, and not because they make you wise or argumentative or give you something to boast about. These are the books you reach for first in your own chimney corner; they open of themselves almost anywhere and no great difference.

You know them as well as the countryside you lived in as a boy. You are at home anywhere between their covers. You know what goes before and what comes after and you take them as you take a street or road which could never lose you with any turning. Such books are not common. An old one is a treasure, a new one is a discovery, to be shared with one's friends and they are the living heart of a man's library as they are the living, lasting heart of literature. Through some magic of style or some gleam of vision or a rippling play of humor or a wise and timeless humanity they establish themselves in the affections of men and are thereafter as nearly immortal as anything of human craftsmanship.

We have had of late lists of all kinds of distinctive books chosen by many tests. I wish someone would give us a list of chimney-corner books.

The older novelists would be sure to be there. One does not read Dickens to see how the story turns out, but just to go along with him through a land of rich imagination full of old inns and stagecoaches driven through an English summer night, and houses whose upper stories touch across narrow streets, peopled with human folk whom you know better than your neighbors. You never mind his leisurely movement; it is timed to your own temper, and he gives you a happy sense of being always at home in his pages, which testifies to a changeless unity of spirit between him and his generations of readers.

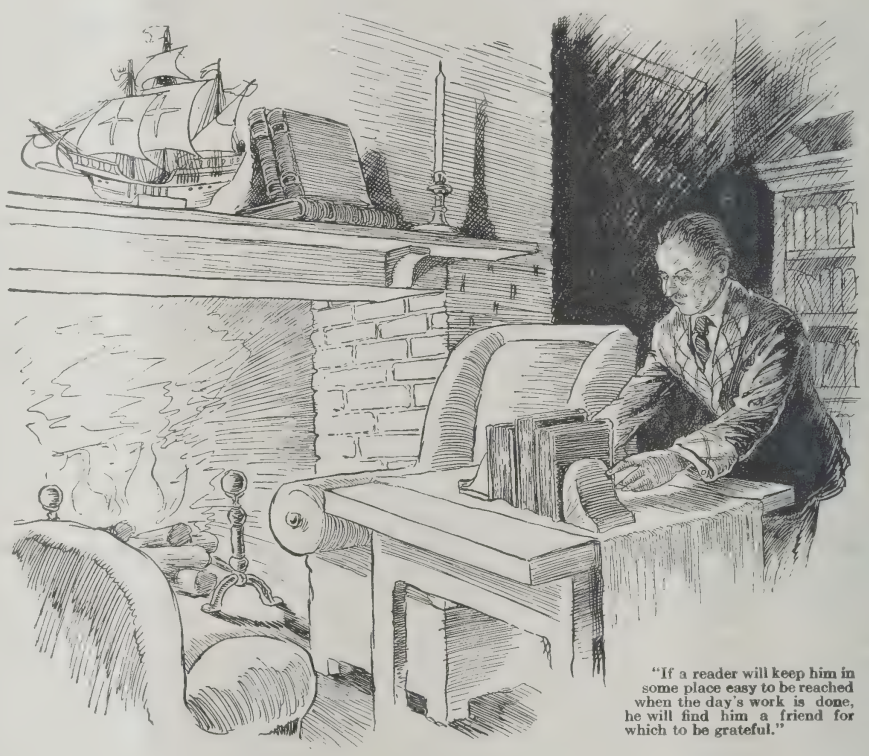
Thackeray has the same magic, and Charlotte Brontë, and Trollop for those who read him now; and DeMorgan nearly had it, and Archibald Marshall and Galsworthy, though they are still to be tested by time.

A deal of modern fiction is a strange country too often full of disagreeable people who get into all kinds of scrapes their creators cannot get them out of. They set a fast pace and they love problems. But one does not want problems at one's own hearthstone.

The best essayist can welcome Lamb's test. He could himself. Essayists generally are writers of the vagrant mind; they like to try new roads and love footpaths and to be abroad under the stars and build a little fire to linger by, and then go on again taking you with them through some region of insight and understanding, but always with plenty of turnings so that what you see and hear as you go along is as rare and pleasing as what they mean to show you when they have quite finished.

This you find in the essays of Augustine Birrell.

Birrell is an Englishman and by profession an equity draftsman and conveyancer, which sounds like Dickens and the cloistered quietness of Lincoln's Inn—one of the hoary varieties of English law practice. He sat in Parliament and the wonder is how he could ever have known so much outside his conveyances and the sittings of the House. We simply do not ripen that kind of mind in America; our publicists are not enough mellowed by literature, and the generality of our writers not enough broadened by affairs. But here is a man matured in the high comradeship of the living and the dead.



He must have read all his life long for the sheer pleasure of reading, and though I can discover no church warden, or briar either, in the frontispiece picture of him—and a fine, clean-cut face he has—his library smelled of tobacco for he admits it. He says of John Milton, "he had his hours of relaxation, of social intercourse and of music, and it is pleasant to remember that one pipe of tobacco. It consecrates your own."

Some of Birrell's essays seem to have been written for the pure joy of writing them—and the 10 guineas a sheet which would not come amiss to an equity conveyancer or even a member of Parliament. In such fashion he leads us happily through eighteenth and nineteenth century literature. I do not know that anyone has done better work. He writes out of a wealth of incidental knowledge, the sort of thing which comes from a mind long and entirely saturated in history, biography and front-stairs' gossip, with a little back-stairs' gossip for spice. If he

begins telling us about Pope he stops for a page to note how Samuel Johnson in his more bellicose moods piously observes that "the possession of great physical strength is no mean assistance to a straightforward life," and finishes with an anecdote of Professor Fawcett who used to skate furiously, though blind, and reassure his fearsome friends by saying, "Why even if I do run up against anybody, it is always the other fellow who gets the worst of it," and all this because Pope was a frail child and a little man.

I think Birrell put a deal of his own gospel in a paragraph he puts in Johnson's own mouth in his essay on Dr. Johnson's gospel:

"There is a great solace in talk. We—you and I—are shipwrecked on a wave-swept rock. At any moment one or the other of us, perhaps both, may be carried out to sea and lost. For the time being we have a modicum of light and warmth, of meat and drink. Let us constitute ourselves a club, stretch out our legs and talk. We have minds, memories, varied experiences, different opinions. Sir, let us talk, not as men who mock at fate, not with coarse speech, but with a manly mixture of the gloom that admits the inevitable, and the merriment that observes the incongruous. Thus talking we shall learn to love one another, not sentimentally but fundamentally." Birrell writes in much the same spirit.

"If a reader will keep him in some place easy to be reached when the day's work is done, he will find him a friend for which to be grateful."

But Birrell is best when he writes of whatever pleases his fancy and out of a mind curiously stored. Being a lawyer, he tells us of the strange ways of his fellow craftsmen. He knows British politics inside and outside, and gently chaffs his fellow politicians. The House of Commons, he discusses, rose from its sittings thirty years ago, but I dare say the House is much the same today. If you want to know with what a saving mixture of reverence and irreverence a Briton contemplates his distinctive institution he will show you. He wrote that essay before Ramsay MacDonald and his Labor cabinet could have been dreamed of, but I wonder if anyone could have given them more wholesome advice. There was, thirty years ago, he thought, need of increased representation in the House of the wage-earning community, and he hopes such representatives may be forthcoming.

"But if they are to do any good in the House of Commons they must go there, not as conquering heroes to whom the unknown future belongs, but as Britons anxious to contribute out of their special knowledge, from their hived experience, to the collective wisdom of the nation; they must be willing to learn as well as teach, to acknowledge mistakes, to widen their views; and, above all, must they recognize that the mighty river of our national existence, if it is to continue to flow as triumphantly as before, must continue to be fed by many tributary streams." Which is good advice for both sides of the Atlantic.

Being an author and a scholar, Birrell naturally says much about book writers and universities, and, above all, being very much alive, he has much to say about manifold human interests and always wisely and humorously. One could never be done quoting him, which would take away from the reader a great joy of discovery. Much of what he wrote antedates the war, though sometimes in a note he corrects the happier expectation of those now unbelievably far-off days by what time has brought and taught us. But for the most part the war and changing times have done nothing to change the meaning or value of what he said since it belongs to a timeless order too high for flying craft to over soar it, too simple and near at hand for guns to shatter it.

Speaking of Milton, Birrell tells us in a little essay on Thomas Tomkins, whose one bid for immortality, in spite of his name, was to have censored *Paradise Lost*, "that the manuscript of *Paradise Lost* has never been recovered." But I saw the manuscript a few months ago in the public display of the marvelous Morgan collection in New York, a collection, by the way, which gives you three centuries of English literature in the manuscripts and letters of the deathless great, a treasure beyond price, and incidentally the crossed and re-crossed pages of the greatest of them shows at what a price of time-forgetting toil they did their work.

Birrell's Tables of Contents are almost anything you please. John Milton and Thomas Paine, John Wesley and Gladstone, Emerson and Cardinal Newman, Epitaphs and Book Binding, Parliamentary candidates and Contempt of Court. He has written some of these essays as a kind of book review now much gone out of fashion. In that type of review a man of letters takes the title of the book and writes at length and learnedly about it, to put the author in his proper place by showing him that there are others who could do as much, or more, if they had turned their minds to it. The book under review is mentioned in a footnote and the reviewer gets 10 guineas a sheet from the *Contemporary* or the *Nineteenth Century*, and the book thrown in.

A happy trade at whose fires many an English writer boiled his pots while he wrote a book of his own.

There is no end to Birrell's happy humor. Pope, he tells us, "was taught his rudiments by stray priests and at small seminaries where, at all events, he had his bent and escaped the contagious error that Homer wrote in Greek in order that English boys might be beaten." All this on two pages of a volume opened anywhere.

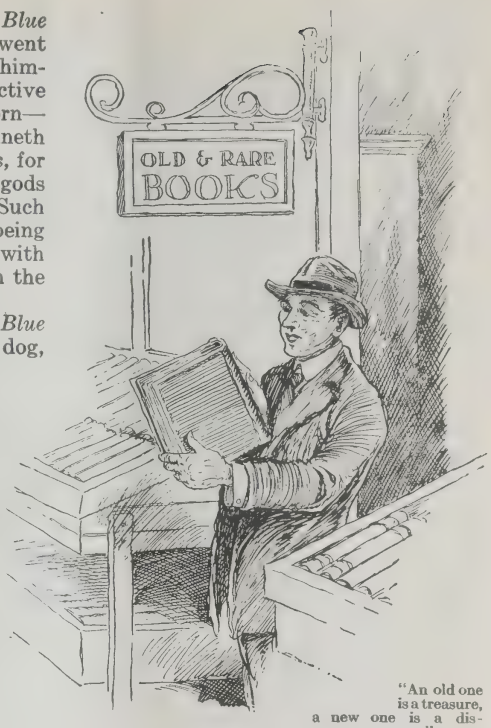
I have just finished Gamaliel Bradford's *Bare Souls*. Bradford's essays in biography are as distinctive as anything done anywhere just now, and both Birrell and Bradford write about the same men—Lamb and Cowper, for example. I do not know how to

compare the essays. Bradford writes as an analyst of the soul; he loves to thread spiritual labyrinths and lay his subjects bare to the hidden heart of them, and he does this amazingly. He is all under the spell of our modern analytical and psychological method—an expert in spiritual dissection. He knows his subjects and I think you know more about Lamb when you have finished Bradford than when you have finished Birrell.

If you want shorter chimney-corner books done at home I commend Christopher Morley. He has the vagrant mind of the born essayist and the happiest of touches, but he has imagination too and a rare genius which moralizes a little and speculates—though not too much—and a gift of song. Morley is young yet but he has done amazingly already. His books have already the true characteristics of chimney-corner books; you can't keep them at home. The books which are the comrades of our firesides—or whatever corresponds thereto in our present scheme of domestication—are the most errant things in the world. They are as deceptive as the family cat which is always leading a double life and whose meek fireside air is merely a masque.

As long as a book stays on its proper shelf it is safe. I have weighty disquisitions on theology and philosophy which have not stirred for a decade. My heirs will find them unmoved and dust-covered when I am gone, and very much to their discomfiture; for they will wish then that their patrimony had been invested in more negotiable instruments.

But a book you are always picking up and reading never stays put. It wanders all over the house and gets left on railway trains and goes off with your friends and never comes back. Morley's books are like that, which is the reason I can't find the one I meant to write about. But *Where the Blue Begins* is here by a miracle for it went to England a while ago. It is as whimsical—I wish I knew a better adjective than that since it is much shopworn—as Barrie and has a touch of Kenneth Graham's *The Wind in the Willows*, for Graham is another favorite of the gods of rare imagination and wise fancy. Such as these never grow up at all, being deathlessly young and seeing life with the eyes of children though old in the wonder and lure of it.



"It wanders all over the house and gets left on railway trains and goes off with your friends and never comes back."

You will be well into *Where the Blue Begins* before you find the hero is a dog, and then need to read it twice before you see what Morley is driving at. We may wander far afield only to find in the end that the blue of far and luring horizons begins at our own hearthstones.

Since Virgil kept bees and Horace gossiped about his farm at the Forum Club in Rome, writers of books have made much of the changing seasons and the observation of growing or winged things. And ever since Gilbert White wrote his *Natural History of Selborne* English literature has specialized in such studies. They are rare chimney-corner books for they will take you far afield without ever stirring from your fireside, and bring you the enchantments of spring when you are storm bound. A well-made catalog from a nursery will do the same thing.

Grant Watson continues this long succession worthily in his *Moods of Earth and Sky*. The name itself should sell it, because your chimney-corner book must always have a rare and taking name. He has written out of a most unusual combination of accurate observation, happy style and deep feeling for life and nature and the stuff of imagination of which poetry is made. A man is worth reading who can write about trees like this: "I sometimes ask myself what else there is in the woods beyond what I see with my eyes. I see the sunlight falling upon the leaves and shining through. The oak is very calm and serene . . . with a masculine courage. The birch tree is humble . . . and with entire confidence bends the tips of her wings toward the earth. I see that one tree is different from another, but do I rightly know them? Are the tales of fairies and tree spirits which come to us from the past but false imaginings? . . . Now in autumn time I think the tree spirits tell one another about the year's achievements and whisper warnings of the coming winter." Watson is always doing something like this. The only fault I find with him, he makes your room a prison and your work a discontent when the March sun lights your windows.

It is a surprise to find that Charles S. Brooks is at home on East 115th street in Cleveland, Ohio, and teaches in Western Reserve College, for his

"An old one is a treasure, a new one is a discovery."

*Pippins and Cheese* sounds like other places and times and reads as if he were a frequenter of old streets and taverns. I think the secret of it is that he takes fancy with him when he goes and can make a happy conceit of the simplest things. He sees how a bootblack makes a jigging melody with the long rag he draws across your shoes—the bootblacks on my corner do it to the music of a graphophone—or how an apple cart may be redolent of orchards in May or October, or how spring brings its magic to city streets. He has for friends all the characters of all the books and will go to the theater in Cleveland with Samuel Pepys or meet Falstaff in a corner grocery. For a man like that a cafeteria is as rare as the Cheshire Cheese, and Dr. Johnson will dine with him in spirit anywhere. *Pippins and Cheese* is a choice fireside book—but keep an eye on it. It will be gone before you know it. The copy about which I am writing slipped in a moment from a friend's table into my overcoat pocket.

I do not know much of Arthur Machen save that he has written a few books with curious names like *The Hill of Dreams*, distinctive for their style and an excess of imagination, and not likely to be named among the best sellers nor widely known. But when he tells us in *Far-Off Things* of his own boyhood in a rectory in Wales and a countryside where one might follow old Roman roads through a land where the legends of King Arthur and his knights lay like the sun-touched mist across the hills, and stops in the kitchens of old farmhouses whose stone floors were so kept that one might eat off them, he does far better.

# What it Means to be a Writer

## SOME INSIDE INFORMATION REGARDING the LITERARY WORKSHOP

"Standardized sources encourage so many immature or mentally unformed aspirants to write."

By THOMAS L. MASSON

ILLUSTRATED BY W. O. FITZGERALD

YEARS ago a now famous author (recently deceased) wrote a novel which had wide recognition but brought him small return. He grubbed along thereafter, making not more than five thousand a year until he passed middle life. Then another book he wrote caught the attention of the public. First as a serial, then as a motion picture (the rights of which were sold for $8,500) then as a book, to be succeeded by others in rapid succession, so that, within a comparatively short space of time, he had gathered up $80,000. All his life he had dreamed of having a home of his own. With the money thus suddenly acquired he built this home, to live in it only a few weeks before he died. Another now internationally prominent writer studied a certain magazine for a year. Getting the formula for short stories, his first story was accepted, and from then on he rose to the proud position of receiving a $50,000 advance for one work. A number of writers could be mentioned whose average annual income is from $50,000 to $100,000 a year. One of the most prominent and successful novelists in the country told me of his visit to another prominent novelist who was even more so. "He employed nineteen servants," he said, "and his house was a pandemonium."

A third novelist—a writer of mystery tales—told how, a decade ago, he went from publisher to publisher, and from newspaper office to newspaper office, looking for a job. He wrote a novel, which was accepted by a fourth-rate magazine and for which he received $250. It was "held" by the editor, and several years later he bought it back and resold it for $7,000. This man told me that he got $20,000 for a serial of eighty thousand words which took him a month to write. He sold the motion picture rights for $20,000 more. O. Henry, who, next to Poe, is perhaps our best short-story writer, died in comparative poverty. Were he alive today, he would probably be worth a million. A friend of mine who grubbed along for many years, writing odd things, wrote me about five years ago that he was going to try his hand at a novel. So doubtful was he of the result that he published it anonymously. It proved a best seller, and he sold the motion picture rights for $25,000.

Some years ago I was asked to appraise the writings of a deceased friend of mine, who had left several books of doubtful monetary value. I placed a value of a few hundred dollars upon them, as they had all been offered to motion picture companies, without result. A few weeks after the appraisal, however, the right to produce one of them was sold by the trustees for $13,500, the excuse offered by the motion picture companies being that they suddenly saw in this book a part for one of their stars.

Women, if anything, succeed even better than men. As high as $5,000 has been paid to a prominent woman writer for a short story. Several others receive from $2,000 to $3,000 a story. The price of short stories varies from $25 to about $2,500 (with the extremes noted). A special writer, particularly if he be a traveler, may receive from $500 to $1,500 each for articles which involve either research or travel. Newspaper rates are, of course, much lower, ranging from six dollars to ten dollars a column, although in the case of articles syndicated, writers frequently receive enormous prices for articles containing special information. This is generally true of war correspondence and inside news. I knew a young war correspondent who during the Russo-Japanese war borrowed the money to take him to the scene. When he finally returned he sold one article to a New York newspaper for $2,500. Another friend of mine—now one of our most prominent novelists, whose first short story I published—wrote minor articles for ten years, including many plays, only one of which was accepted, and that was a failure. So his first novels fell flat, until he finally wrote a farce that was a success. This led to other plays, and finally to novels again until, as he confided to me, he had "learned the formula." He was, however, unhappy. "I hate my stuff," he admitted, "but I have learned what the public wants."

I have indicated a number of in-

stances of large profits, merely for the sake of later counteracting the erroneous impression about writing which exists so largely among so many literary aspirants. This impression is that if a writer is possessed of talent and can afford to employ a secretary, he has only to spend a reasonable amount of time in dictating masterpieces which within a few years, or even months, will bring him a princely return. Also, *it is assumed that anybody can write without special preparation;* yet I know of no instance of successful writing that has not been preceded by a long preliminary training, involving, as a rule, heart-breaking discouragements which only the greatest courage and persistence have overcome. Also, most of the successful writers I know express constant anxiety about their work. They know that, while for a certain length of time they may be able to dispose of inferior manuscripts, this work continues to be judged by editors on its merits alone. Names count only in so far as they indicate that the men back of them are capable.

There are two things which the editors of fiction magazines are concerned about—the first is to get new writers, and the second is to keep the old ones up to their own level or higher. Thus the mail is very closely read on the one hand, and on the other, editors keep in as close touch as possible with their old contributors.

*Undoubtedly the story writer, whose work yields the largest monetary returns, is born to his calling.* He has, or has not, the gift—which, even at that, requires long training to develop. So it is with the dramatist, whose profits may also be as large. But aside from these two classes of writers, all the others (and the poets, of whom, alas! there are so few) are more concerned with the "joy of the working" than with the actual returns in money, as steady as those returns may be in some cases.

*Now it is against all this very considerable body of trained writers that the young literary aspirant*—whose name appears to be legion—*has to set his lance.* Let him not necessarily be dismayed, but at least let him at the start know the truth. Let him understand, first, that the large incomes earned by the few at the top are rare exceptions among multitudes who earn a bare living; second, that where a large income is earned it is not as a rule the result of the highest creative genius, but is due to a business ability of high order united with great talent in putting before the public at the right moment just what the public wants (a combination which requires as much preliminary training as that of any other selling profession), and third, that the technique of writing in itself, and aside from the writer's knowledge of life, requires long years of toil, and has been the continuous despair of even the greatest writers.

For thirty years now I have been reading on the average three hundred manuscripts a week from would-be contributors all over the United States and there is always the same prevailing note: "*I thought I would try my hand at writing, as I have always had it in me, and just at present I need the money, so I inclose—*"

There are one or two reputable courses in short-story writing, and some of the colleges have developed admirable methods of literary instruction. Generally speaking, the literary aspirant of genuine merit will steer clear of all props. Those who seek too much help from *standardized sources*, that is, who do not recognize them only as adjuncts, are beaten before they start. The fact that they depend upon these courses for help is evidence of that kind of weakness which indicates their incapacity for ultimate success. The true artist never takes the beaten path. The regular literary agencies which sell the writings of established (and in some cases of mere beginning) writers are, however, useful. Their relationship with the author on the one hand and the editor on the other is one of strictly business; although in many cases their advice is valuable, because wholly impersonal. *Some writers prefer to deal directly with editors.* This is largely a matter of temperament and inclination. Most periodicals and all important newspapers employ staffs of experienced writers, but this very rarely precludes the acceptance of outside material suitable for their purposes. The great difficulty with so many of the mediums (aside from the established literary agencies) is that they *encourage so many immature or mentally unformed aspirants to write,* not only upon the false principle that writing is an end in itself, to be pursued without first-hand experience, but also because, on this false principle, they can make money at it.

"Now it is a phenomenon of no trivial importance that all writing which finds its way into print must almost invariably be accompanied by an exchange of money."

*Now it is a phenomenon of no trivial importance that all writing which finds its way into print must almost invariably be accompanied by an exchange of money.*

But when we consider the writing of anything at all and the payment thereof solely as a money transaction, we are likely to overlook two things:

"Now it is against all this considerable body of trained writers that the young literary aspirant has to set his lance."

First, when a piece of writing is produced solely for the money it may bring, the transaction is ended the moment the money is paid; second, owing to the "pressure" of modern materialism referred to, writers who display great natural talent in the beginning, and make money too rapidly, almost invariably deteriorate. Their ability to produce is due to their very commonness: rising from common stock, they voice common aspirations. Out of rich families have come many writers of distinction; but not, as a rule, the most popular. I speak from first-hand knowledge when I state that no one realizes this more than the popular writers themselves. In common with other classes of successful men and women, they are the victims of a system over which they have no control, and it is remarkable how they manage to retain as much simplicity as they do. It must also be remembered that in itself success is expensive. A popular writer must maintain efficient help; he must travel about; he must dip into every environment which gives him his raw material.

Privation in the beginning, accompanied by the capacity for self-denial, is the best background for success. The test of any writing is that it is of benefit to somebody; not necessarily to everybody, but to somebody. If it fails there, it fails in everything, even if, temporarily, a writer makes money out of it. To be entertained is immensely valuable if the entertainment is of the right sort. Writing which leaves men and women mentally below their accustomed standards, even if they like it, does not make for a writer's lasting success. Most writers who start out are too ambitious. In the very beginning they want to write plays or novels. Failing this, they try short stories. Failing this, they throw up their hands and announce that all editors are afflicted with favoritism. Another illusion is that work in itself is everything. Work is necessary, but having solved the question of bare support, the end in view is what counts. As long as human nature is on its present basis, sex and sensationalism can be exploited by any writer for a certain length of time. In the end it is destructive. A writer should not only have something to say and know how to say it, but he should also be sure that it has permanent value. As a lesson in expediency, the story is related of Paul Leicester Ford that in a casual conversation on best sellers he declared on a bet that he could write one within a certain period, and thereupon produced *The Honorable Peter Sterling*. Louis Aggasiz, the naturalist, offered by a platform man $100,000 for a series of one hundred lectures, replied: "I have no time to make money." A writer of capacity and experience is certain to get a hearing. No good utterance, born of truth and sincerity, can be permanently suppressed. Archibald Clavering Gunter could not get his ultimately successful *Mr. Barnes of New York* accepted, so he published it himself. The history of the publishing trade, from *Lorna Doone* to *David Harum* and beyond, is dotted with similar incidents.

A writer must not only have something to say, but must acquire a manner of saying it peculiarly his own. To accomplish this result is his real object, and in its pursuit (which may easily require half a lifetime) all other objects are inconsequential. Poverty at some stage may be a necessary part of the program. He cannot consider himself in any way. He must give up everything for the end in view.

Specifically, a literary aspirant should lean on no material agency. He should keep himself free from all entangling alliances, either domestic or foreign. The greatest artist of all time understood the problem when he said:

"That every idle word that men shall speak, they shall give account thereof in the day of judgment. For by thy words thou shalt be justified, and by thy words thou shalt be condemned."

***I read in the papers*** that the English railroads have granted commercial travelers whose affairs would ordinarily require them to be away from home over the week-end a one-way rate for the round trip home during that period. This is evidently intended to meet the steadily increasing use of automobiles by commercial travelers, who are thus adopting the methods of American salesmen in covering their territories. Thus the British traveling man has come to have the privilege of spending the week-end with his family, either through the use of his own motor car or the new, cheap railway fares.

***I read in the papers*** that our popular ideas of the English country gentlemen being a class of bluebloods who scorn tradesmen is largely a delusion. The Earls of Radnor, Essex, Dartmouth, Craven, Warwick, Tankerville and Pomfret, all very high-sounding to Americans, are respectively descended from a City merchant, a London mercer, a silk manufacturer, an alderman, a leather dealer, a tailor, a merchant and a Calais merchant. The famous Cornwallis and Coventry families owe their prosperity to "trade." Another delusion is that the old English squires belong to families that cling to their estates for countless generations. As a matter of fact the turnover is rather rapid, three generations is the average tenure of the great estates. The present rapid disappearance is due to a number of modern causes, the chief of which is the inheritance tax that was sponsored by Sir William Harcourt, whose political maneuvers compelled him to move to destroy the very class of which he was so conspicuous a figure. The more we learn of the fabled grandeur of Europe the less "grand" it seems from the Main Street viewpoint.

***I read in the papers*** that Fort Dodge, Iowa, has just replaced with motor bus service a street car system that has long failed to meet expenses, the deficit increasing every year. The street railway, especially the fast subway, is probably the best means that ever will be devised to carry wage earners in the great cities to and from work; but the needs of average sized communities seem to be better served by motor vehicles.

*The International Jew* in 4 volumes: *The International Jew*, Vol. I, 235 pages; *Jewish Activities in the United States*, Vol. II, 256 pages; *Jewish Influence on American Life*, Vol. III, 256 pages; *Aspects of Jewish Power in the United States*, Vol. IV, 246 pages. Price: 25 cents each; set, $1. The Dearborn Publishing Company, Dearborn, Michigan.

***I read in*** *The Irish Statesman*, this characteristic and true observation:

"We may be quite sure that the children who grow up in a countryside where the waves of world-thought beat in upon them will grow up very different in mentality from their elders. . . . What kind of mentality there will be we cannot prophesy. The cinema has done a great deal to vulgarise imagination. Broadcasting may be vulgarised so that ear and eye alike will be debased in their sensitiveness. The thing itself must come. What its results will be for the Irish character will depend on the director appointed, his vision of what is possible and his catholicity of mind. He may finally come to be almost as potent as the Ministry of Education. Heaven forbid he should be solely what is called a 'highbrow,' but the devil will surely rejoice if he is incapable of understanding that there is an incorruptible spiritual atom in every man, and if he appeals solely to the same mentality as the Hollywood film producers imagine is common everywhere, and which they feed with vulgar farce and sickening sentiment."

# A Writer Who Does Not Believe in Plots Nor Use Them

By LOUIS ALLEN

Heading Design by GERALD VAN DER HEYDEN

HAILED perennially by Edward J. O'Brien as the most significant writer of short stories of distinction in America; first winner of *The Dial* prize of $2,000 for the finest creative work by an American; censured and condemned by a large group of fiction readers, who believe a spade should be called anything but a spade, Sherwood Anderson writes steadily on, apparently unmindful of the wordy storms gathering about his leonine head. Whether or not we approve his manner or his matter, Anderson is unquestionably one of America's outstanding fictionists.

Sherwood Anderson likes to write; he does not relish talking about himself. He is volubility itself when discussing a wide range of topics. It is when one tries to dig into his personal side that his rock of reserve quickly blunts the interrogation point. I suspect this is the reason why so little has been printed about the man himself.

At first glance there is little about Sherwood Anderson to set him apart. He is of average height and stocky build. Large head with tousled hair and the features of a character actor attract. But it is not so much the salient chin, the wealth of hair or the wide expressive mouth that holds the attention; it is the eyes. Anderson's almost jet-black eyes, heritage of Mediterranean lineage, are his unforgettable feature. They are soft, feeling, sympathetic eyes, eyes that have penetrated into the inner man and woman with greater perception than have most of his contemporaries. Anderson is himself natural and human; he has written of natural and human beings.

Like De Maupassant, Anderson served a long writing apprenticeship before storming the editorial sanctums. Like George Eliot he wrote but did not publish until middle life. When he finally laid aside his apprentice tools and leaped into the literary ring, Anderson astonished not only by the maturity and originality of his conceptions, but by the lucidity of his style. While others were knocking at editorial doors with their first-born thoughts, Anderson patiently blotted and courageously consigned his work to the waste basket.

"I'm afraid I can't give you much real material," was his greeting when I met him in the shadow of the campanile at the University of California, Berkeley. Interviewers often find that men who depreciate their own reservoir of experiences are sometimes the deepest of wells when pumped. One who is to reach his half-century next year, who with only a common schooling worked into a position of advertising writing and short-story excellence before he was 38, and entered the novelist's field not without distinction at 41, seemed to connote material in profusion.

Apparently Anderson's family tree bore no preserved literary fruit before him.

"There have been no writers in my family so far as I know, but of the six children, seven, counting a baby that died in infancy, all either wrote or painted at one time or another. I have an older brother, Karl Anderson, a well-known American painter."

I had gathered from that succinct work *Who's Who* that Anderson was born at Camden, Ohio, September 13, 1876. This furnished the thread which he took up at once, in relation to his later writing experiences.

"Having listened as a lad to tales told by my father, who by the way was a natural born teller of tales, I wanted to begin inventing tales of my own. At that time I had no notion of writing. Later, when I began to write I believed I would never publish."

As one of a numerous family of painfully inadequate finances, Sherwood Anderson early went to work. He labored in a sheet iron warehouse, later as an assembler in a bicycle factory, later still as manufacturer and finally as an advertising writer in Chicago.

"What authors most influenced you?"

"That's pretty hard to say. Any good writer I read, I dare say, does something to me. As a lad I read avidly everything that came into my hands—Walter Scott, Shakespeare, the Bible, Jules Verne, dime novels, Stevenson, Whitman and Mark Twain—just to mention a few.

"Later, Van Wyck Brooks' *America Coming-of-Age* moved me deeply. He, with Waldo Frank and several others, had started a magazine called *The Seven Arts*, which died and was later reborn as *The Dial*."

As a qualifier of the youthful Anderson's penchant for reading, "omnivorous" seems entirely inadequate.

"A passion for reading books early took possession of me. So long as I had any money I did not work, but spent my time reading any book I could get my hands on. After working a few weeks I would have a few dollars saved up, and dollars meant leisure to read. That is about all dollars ever meant to me. Books have always fed my dreams. I am one who has always lived by my dreams. I can often get as much satisfaction out of a dull book as out of a brilliant one.

"All during the later years of my life as a manufacturer and as an advertising writer, I had been writing tales. I believe the first accepted story of mine was by *Harper's*. I was thrilled of course. The story wasn't first-class, I'm afraid. I have never been tempted to republish it in a book. My first novel—*Windy McPherson's Son*—was one of those novels written before any were offered for publication. In some places my tales were praised, in others blamed. I had moments of exultation in believing I had penetrated a little into the life story of some man or woman."

After *Windy McPherson's Son* came the novels: *Marching Men*, 1917; *Winesburg, Ohio*, 1919; *Poor White*, 1920; *The Triumph of the Egg*, 1921; *Many Marriages*, 1922, and *Horses and Men*, 1923. Scattered between the novels came a steady stream of short stories. In 1924 appeared the autobiographical *A Story-Teller's Story*.

Unlike Jack London, who abhorred the labor of composition, but forced himself to compose a (*Concluded on page 26*)

Tailpiece by that master of the block of wood and chisel, Thomas Bewick.

# Wood Blocks as Story-Telling Medium

## An Art That Is Now Being Happily Revived

By HENRIETTE BOECKMANN

An old wood block on which is cut a coat of arms.

THE Pharaohs might have had access to a newspaper before Moses was born, had they but thought of applying a coloring pigment to their relieved or incised inscriptions and then bringing them in contact with damp paper for supplying any number of impressions. The stamps used 3,000 years ago in Egypt to impress bricks, or the cylinders used as seals in Babylon, may be printed from today as from a modern woodcut.

It does seem, then, unaccountable that the world should have existed for so many thousands of years before the simple invention of wood-block printing was discovered. Conception and mode of treatment define the birth of this ancient art as occurring somewhere in the latter half of the fourteenth century.

There can be no gainsaying that wood blocks possess a remarkable quality as a story-telling medium, although the reason for this is at first puzzling considering the limitations of the artist equipped with only his graver and bit of wood. Within the narrow scope of a woodcut lies an inherent charm of simplicity comparable to that charm found in folklore and fairy tales. And back of the naïveté stands that very rare ensemble—the mentality of a wood engraver, he who works in memories of chisel cuts. For simple as are wood-block impressions, the cutting of a block is most difficult if a worthy picture is produced.

At present the world of arts witnesses what might be called a renaissance in the art of engraving on wood, so general has become the interest in art schools and among artists, linoleum blocks being used freely by students not only in institutions for the study of art exclusively but in many of the public schools as well.

When in 1916 I first wrote of wood blocks, few persons with whom I came in contact, who were not themselves artists, knew the meaning of the term, much less had they ever seen or at least recognized an example of this art, so that when a foreigner arrived with a collection of wood blocks and exhibited them in a leading western city before a women's club numbering thousands of members, there was a hubbub of enlightened interest.

This is dated 1550, and was used in *Illustrations of Shakespeare* by Francis Doure and also for an early Chap Booke, *The History of Adam bed, Clyon of the cloughe and Wyllyam of Cloudesle.*

In wood blocks, art and history go hand in hand, threading their way down the long paths of past centuries, a perspective of which we obtain today upon examining a collection of the little bits of carved pear, sandal, and box wood. The purchase six years ago of the world's largest collection of wood blocks from its compiler, J. Tarbotton Armstrong, by the railroad magnate, Henry E. Huntington, for his magnificent library and art gallery at San Marino, California, in which are lodged some of the finest paintings as well as the rarest books to be found in the whole world, reflects with illuminating intensity the revival of the art of wood engraving although at that time the groups of artists working at this craft were indeed very small, whereas today finds a growing group of excellent wood-block artists in all the great nations with examples of some of the work done by our best national artists reproduced in the *Century*.

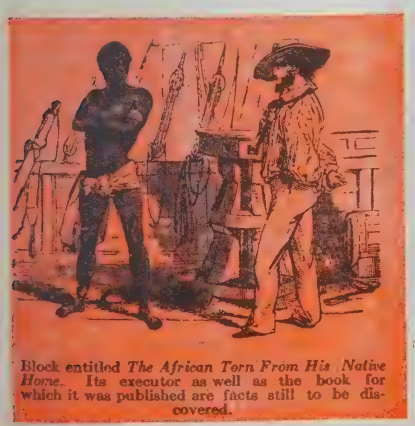
It is from a selection of the wood blocks in this world-renowned collection in the Huntington library that the illustrations for this article were obtained, together with a number still in possession of the scholarly Englishman who through a period of thirty years sedulously gathered together this host of history-haunted blocks of wood cut with such exquisite care. From the eminent George Watson Cole, librarian of the Huntington Library and Art Gallery, I recently received word to the effect that his priceless assemblage of historical woodcuts has remained hidden to the art world, the blocks being still in the packing cases in which they were placed at the time of transfer in ownership. Many of the exceedingly rare volumes in the Huntington, Morgan, Frick, and other great libraries of this country, were illustrated from among these blocks now permanently located at San Marino.

Since there may be any number of copies of a book, but only one specimen of a wood block used in the printing of the book, the value of these old relics is readily understood. It is also true that while many of the earliest books printed have been destroyed, the blocks which illustrated them are still in existence, although it is a marvel that so many of the old blocks still exist since it was common in the day of their conception to toss them into the fire when the printer had finished with them.

Mr. Armstrong in his accumulation of these wood blocks was especially fortunate in finding, both in Britain and on the Continent, any number of models designed for illustration of children's books which engender a wealth of charm, disclosing, as they do, an invaluable record of fancies and fashions of childhood in pre-Victorian days. The first blocks used to illustrate *Aesops Fables, Pilgrim's Progress,*

As early as 1441 Caxton printed the first copy of this block entitled, *The History of Renyard the Fox.*

*Robinson Crusoe*, and a whole gamut of others not so generally known, were all assembled by Mr. Armstrong to be open to the public's inspection at the handsome Huntington estate in Southern California.



Another interesting feature of this vast collection is a series of blocks illustrative of Old London Cries as found in a quaint old ballad entitled *London Lyck Penny*, or luck penny, by that prolific writer, John Lydgat, a Benedictine monk who lived about the middle of the fifteenth century. A sample of the cries of London, as daily exhibited in the streets for centuries thereafter are:

"Sixpense a peck pease,
Rare Marrowfat pease."

"A croat a pound,
Black-heart cherries round and sound."

Addison has somewhere said, "There is nothing which more astonishes a foreigner, and rights a country squire, than the cries of London."

In 1844 there was discovered at Malines a woodcut dated 1418 which passed into the royal library at Brussels as the earliest known wood block bearing a date. The subject is the Virgin and Child surrounded by female saints, the whole being inclosed by a border on the block which is ten inches wide and fifteen inches long. The date appears to have been tampered with, and all critics do not agree on the exact date of its execution. However that may be, for several decades prior to the supposed date of this block, wooden stamps in relief were used to impress on paper and parchment the signatures and marks of kings, nobles, the clergy, and merchants as well as others; and there is no question but that at a very early period the illuminators of manuscripts often made use of a stamp to form their ornamental capital letters, giving these fourteenth-century carvers the credit, to some

Block entitled *The African Torn From His Native Home*. Its executor as well as the book for which it was published are facts still to be discovered.

measure at least, for the invention of wood engraving.

To the German card-makers, the first of whom were women living at Nuremberg, is the practice of wood carving generally attributed, since they used a wooden stamp to form the outlines of their figures to be later colored by stenciling.

When it became evident that the conception of these cheap and showy cards contributed a disastrous influence by adding, to an alarming degree, to the fascination of gaming, the clergy stepped in and a crusade was started against the card-painters, with the monk Bernardin of Siena—afterward sainted for his zeal—as leader. The crusade reached its climax when a fire was built before this monk's pulpit of what Burns termed "the devil's picture books."

Upon hearing one *Kartenmacher's* plea as to what he should now depend upon for a livelihood, the production of these playing cards being the only trade he knew, Bernardin with ready wit

From *The Dance of Death* the renowned series executed by Holbein and printed by the Lyons Press in 1538.

drew on his tablet the sacred monogram "I. H. S." (Iesus Hominum Salvator—Jesus the Savior of Men) in the center of a radiant sun, and said, "Paint this holy figure, and a better fortune will attend you." History records that the poor *Kartenmacher* did indeed grow rich from the demand for the new device he painted with such brilliant colors.

These coarse engraved outlines with their rude stenciled tints, generally in primitive hues—yellow, blue, red and green—came to be the pictures of the poor made in humble imitations of the missal or manuscript drawing which only the wealthy could afford. Scarcely any record is retained of their early beginning, they for the most part being but miserable works of art pasted against cottage walls. The few preserved have been found on the flyleaves of books. As the work progressed it was found that explanation of some of these pictures, usually Biblical, was necessary, and presently a text was added to these ancient examples of xylography, both text and picture being cut from a solid block of wood.

The printed pages thus formed were

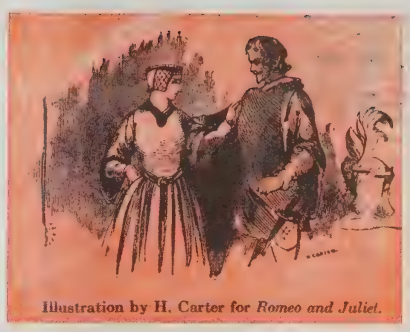


Illustration by H. Carter for *Romeo and Juliet*.

placed back to back, pasted together, and there was developed that earliest form of book we possess—the block-book. The best known of these block-books is the *Bible of the Poor* and the *History of the Virgin*. They were drawn upon wood in a coarse and crude fashion, yet in the very rudeness of its rapid work, this early block carving was on the road to the grandeur and true style demanded by wood engraving. There is a simplicity that is not without attraction in the illustrations of these first xylographic books, not to mention a lively sentiment of reality joined to a subtle and mystical spirit.

These block-books had the disadvantage of being engraved in solid pages so that in case of accident or error the mistake could be corrected only through paring out the part and substituting a fresh piece of wood for another engraving. The greatest of all improvements in printing was being developed, however, at this time; that is the movable type which eradicated the old hindrance.

Whether credit is due Holland or Germany for giving birth to the son who created the movable type was ever a much-mooted question, especially in bygone centuries. But we have this account from the worthy old printer, Ulric Zell, appearing in the Cologne *Chronicle* in the year 1499: "This most revered art was first discovered in Metz, in Germany, and it is a great honor to the German nation that such ingenious men were found in it. This happened in the year of our Lord 1440; and from that time until the year 1450, the art, and what belong to it, was rendered most perfect. Although the art was invented at Metz, as aforesaid, in the manner it is now commonly used, the first idea originated in Holland from *the Donatuses*, which were printed there even before that time; and from out of them has been taken the beginning of the aforesaid art, which has since been perfected more cunningly than it was according to that same method, and is become more and more ingenious."

In the earliest book to appear with a date and the printer's name—the Psalter printed by Faust and Scheffer at Metz in 1457—the large initial letters engraved on wood and printed in red and blue ink are the most beautiful specimens of this kind of ornament which the united efforts of the wood

engraver and the pressman have produced. They have been imitated in modern times, but not excelled.

The Nuremberg *Chronicle*, issued in 1493, is a ponderous folio with more than 2,000 cuts on wood devoted to representation of places as well as personages, real and imaginary, and scenes, sacred and profane. These are coarse in construction but have the advantage of possessing bolder effects in light and shade than usual with the introduction of the "cross-hatching," or shadow lines passing over each other—a difficulty at all times and soon extensively adopted in this graphic art numbered among the very oldest, although today's critics deplore even the slightest overture to this practice.

The historical scenes in the Nuremberg *Chronicle* were made by Michael Wohlgemuth, an artist of great repute in the old imperial city of Nuremberg, but now remembered chiefly as the master of Albert Dürer, the greatest name in old German art.

Upon the appearance in 1471 of Dürer on what was then a rather narrow stage of wood engraving, the art spread not only over the Continent but it arose to a pinnacle of perfection without going beyond its primitive condition of simplicity. Traced with breadth and decision, the drawings of Dürer teach us the concise, vigorous manner demanded by this kind of art. So colossal were some of this artist's woodcuts that they could be used only for ornamentation on the walls of a palace gallery or for the partitions of a vestibule. The Emperor of Germany, Maximilian I, was a great patron of the new art, and Dürer's greatest work, *The Triumph of the Emperor Maximilian*, is still preserved in long series at Vienna.

Taking into consideration all the copper engravings, the paintings, drawings and carvings, as well as written works on art with which Dürer occupied himself, it would have been impossible for this masterful artist to have cut all the wood blocks attributed to him. Hans Burgmair, there is every reason to believe, was one of the principal engravers of Dürer's designs.

The most remarkable of all these series of copiously illustrated books was given to the world in 1538 by the Lyons Press. This series, which has withstood all criticism and still remains triumphant, is the renowned *Dance of Death* from the models of Hans Holbein born in 1497. No facsimiles have hitherto fully equaled the original; they possess no needless display of mechanical skill, but are executed in a manner at once simple and efficient; and they are not remarkable for their mere delicacy of lines but for the fact that these lines properly convey their meaning which one finds so well illustrated in the present-day work of J. J. Lankes, whose work has been depicted in the *Century*.

In contrast with the work of Dürer's woodcuts, ofttimes covering a prodigious area, Holbein cut his designs from blocks smaller than the palm of the hand, some being only an inch square, for the accommodation of the carving delineating a complete landscape. Within the microscopic dimensions of a letter this artist represented the drama of Death twenty-four times repeated, the limitations of his field seeming only to act as a spur to his genius, so much of life and expression does he display in his minutest models.

These were the palmy days of wood engraving to which lovers of the art look back and regret that the press-work of those times was not on a par with the engraving, printing being far inferior to the careful work and brilliant inks of modern times.

Upon the advent of the seventeenth century, wood-block carving had sunk into the pitfall of illustration by means of copper plates. An inferior race of wood carvers and an overstocked book market led to the change in conditions. Chatto in his history on art observes that "between 1650 and 1700, wood engraving, as a means of multiplying the designs of eminent artists, either as illustrators of books or as separate cuts, may be considered as having reached its lowest ebb."

Then came the revival of the art through the work of one artist who had every claim to the title. He was Thomas Bewick, born in 1735 at Cherry Burn in England. It was in 1779 that there appeared from the press of T. Saint at Newcastle-on-Tyne an edition of *Gay's Fables* illustrated with the handiwork of this engraver who in a short time became universally distinguished. It was Bewick's genius which again called the public's attention to the neglected art of wood engraving. He was at once a pioneer and a masterly adapter, leading all who followed him to realize the possibilities of the art.

An exceedingly interesting block especially to students of French history, which was executed by the famous Cruikshank, and shows the Hotel de Ville looking down upon the Revolution of July, 1830, in Paris.

When in the latter half of the nineteenth century wood engraving was chained to the task of reproducing painting, sculpture, wash-drawing or line drawing, just as the half tone does today, the art again fell upon evil days. It was forgotten that wood engraving had a manner of its own, a manner developed by men who realized its limitations as well as its possibilities. William Morris, whose perfect examples of wood carving came to the fore in 1890, walks alone in bearing aloft the fine old standard of the ancient art during this interim of time.

The most sturdy hopes have been variously expressed this past year or two, in print and otherwise, for the flowering of a "Golden Age" in wood-block printing. Certain is it that sufficient arable material is at hand in which to cultivate this desideratum, not only in this country but in all the great nations of the world. In the last three or four years the popularity of transmuting the painter's art into the monochrome of the woodcut has grown so steadfastly that exhibition of the work of present-day graver-painters is not uncommon in the largest cities. An exhibition in New York recently showed the work of wood block artists from Holland, Great Britain, Germany, Japan, India, Italy, France, Czecho-Slovakia and our own country.

Prints from engravings on wood frequently afford undeniable evidence of lateness of impression by interruptions appearing in the lines of the work occasioned by the relief cutting on the block having been broken away in parts, or indented by the operation of printing. Until these imperfections occur the difference between early and late impressions of an engraved block is by no means so striking as in copper plate engraving. Wooden blocks are capable of throwing off an enormous number of impressions. Some of the old head and tail pieces, such as illustrate this article, were used throughout their publications, a number having given off as many as 450,000 impressions.

The charm of wood engraving is largely due to the fact that in the wood block we have the actual work of the artist, while in the more modern styles of engraving the process is purely mechanical. There is as much difference in a beautifully executed wood engraving and an ordinary half tone as there is between a photograph and a delicate water color painting; or between a piece of cast-iron work, and one that is of finely wrought iron. It is a pleasure and delight nowadays for one to turn to an old book or magazine and dwell on the masterpieces of this art in the past.

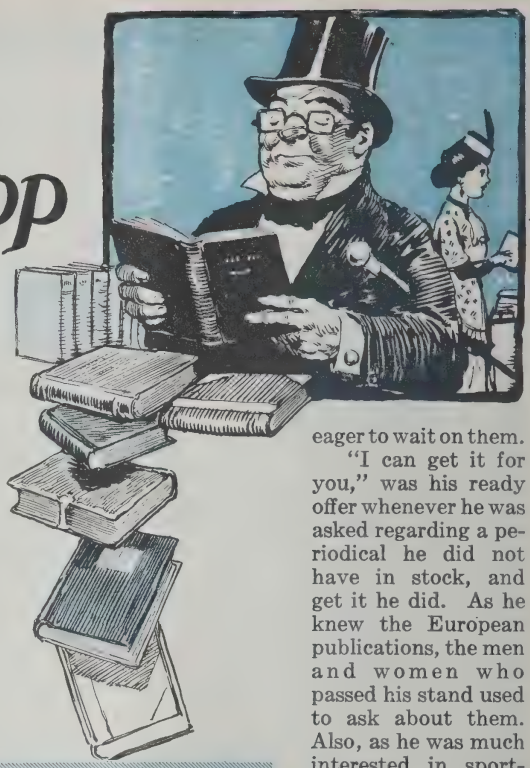
# Confidence Based On Performance

Thousands of Ford cars go out daily from the Ford assembly lines. They are delivered to people who have every confidence that their cars will perform reliably and economically.

More than twelve million Fords—used in almost every habitable land, under every conceivable motoring condition—have contributed toward this universal good will.

Every characteristic that has been instrumental in building good will for Ford cars in the past is even more pronounced in the latest Fords.

Economy, dependability and performance are today—as always—outstanding Ford characteristics.



With recent improvements giving new beauty and finer riding comforts, Ford value is now more obvious than ever—and the demand for Ford cars is without precedent.

FORD MOTOR COMPANY, DETROIT, MICH.

# The Magic in an Old Book-shop

By COURTENAY SAVAGE

THERE is in a bookshop a soft magic that banishes time and place. Down from the shelves, where word pictures laugh at the passing years, comes a spell which hushes the rush of the city, and even modern men of great efficiency forget themselves as they linger in the presence of the ghosts that troop from the pages and tell their tales with such brilliancy that dead days leap into life and color.

It is doubtless because of this magic of books that so many people have been deeply interested in the fact that Brentano's has been moved from its old quarters near Madison Square, in New York City, to the more popular shopping neighborhood of Forty-seventh street just west of Fifth Avenue. True, other business organizations have moved, firms that have been in existence for as many years as Brentano's, for the great city stretching out its eager maw decrees that what was once a smart shopping neighborhood is no longer fashionable, but then Brentano's has been synonymous with the literary life of the city for more than seventy years.

Brentano's Literary Emporium on Union Square. From a drawing made for *Every Saturday* in the early seventies.

August Brentano—the founder of the bookshop that bears his name.

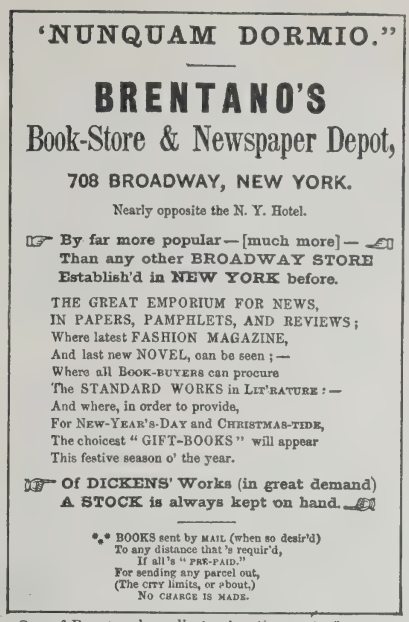
It was in 1853 that August Brentano opened his first news stand. Only a young man of vision, and of cheerful courage, would have dared to start business with a capital the total of which was a few dollars and a love of printed things—books and newspapers. And such a business—one that was a complete innovation, for in those days newspapers and magazines were almost wholly distributed by carriers who went from house to house, each carrier having his definite route, trying always to add a few new families, and hoping that there would be no hitch about collecting the weekly bill.

But August Brentano had an idea, new, startling, definite. Why shouldn't he establish a stand in one particular spot, and stay there until everyone knew just where he could be found when they needed a newspaper or a magazine? This was the idea that started Brentano's Bookshop!

The next morning passers-by on Broadway saw outside the old New York Hotel a young man standing behind a small stand on which he had displayed papers and a few magazines. It was an odd enough sight to cause comment, and those who stopped found a very cheerful young man eager to wait on them.

"I can get it for you," was his ready offer whenever he was asked regarding a periodical he did not have in stock, and get it he did. As he knew the European publications, the men and women who passed his stand used to ask about them. Also, as he was much interested in sporting events, he began to feature and recommend publications devoted to such news. At the time of the now famous Heenan-Sayres prize fight in England, in the days before the cable, young Brentano realized that his customers would be keenly interested in the details of the fight, so ordered a large quantity of English newspapers describing the bout. These were sent to him by the first steamer and he was on the dock to receive them. He had told his customers that he would have the papers and before the end of the day had sold out at the amazing price of $1 a paper.

Swiftly, such incidents as this established for him a clientele that included such men as Peter Cooper, Cornelius Vanderbilt, the men of the Goelet, Belmont and Astor families, in fact, all of the wealthy men who had their homes around Washington Square and to the east of the city along what is now East Broadway and Second avenue. From his small stand in front of the New York Hotel he moved to the hallway of the Revere House at Houston street and Broadway. In five years' time he had outgrown a news stand and had opened his bookshop in the basement at 658 Broadway.



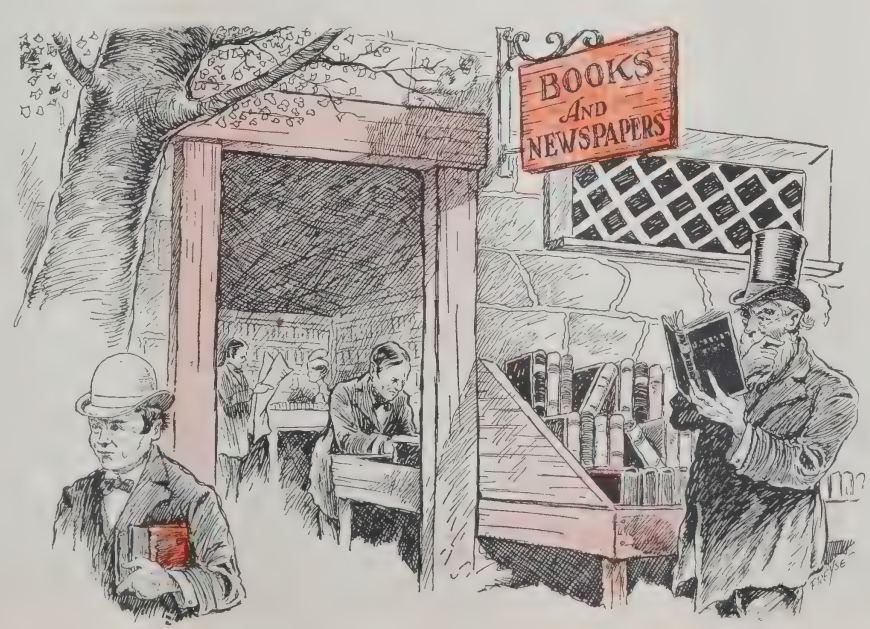
Five or six years later Brentano's Bookstore & Newspaper Depot had

become so popular that larger quarters were necessary and in 1865 he moved to 708 Broadway, next door to the tobacco shop kept by the father of Dan and Charles Frohman, young men who later in life were to be theatrical producers.

By this time the literary men of the day had begun to patronize Brentano's as a meeting place and the general public quickly realized that fact, going there, not only to buy books, but in hopes of seeing some of the city's famous personages. William Cullen Bryan, then editor of the *Evening Post*, as well as a popular poet of the day; R. H. Stoddard, George William Curtis, Edmund Clarence Stedman and Bayard Taylor were writers who frequented Brentano's—so did Alice and Phoebe Carey, who had come to New York from Ohio to establish their home—and when Ralph Waldo Emerson or James Russell Lowell were in the city, they found Mr. Brentano's shop as interesting as the Old Corner Bookstore in Boston. Charles Dickens when he visited the United States spent hours in the store studying the literature of the country that made him so greatly welcome—Thackeray was another distinguished visitor. Three other men who were frequent visitors to Brentano's in those days were U. S. Grant, then writing his memoirs; Chester Arthur, another ex-President of the United States, and Abraham Lincoln's son Robert.

Another help in establishing trade was Mr. Brentano's belief in advertising. He had a gift for doggerel verse and wrote ads in rhyme that appeared not only in the local papers but in the weeklies that were circulated throughout the country.

The popularity of his shop, and the growth of the city, forced Mr. Brentano's decision to move his business uptown in 1870, so he went to larger quarters at 33 Union Square. At 33 Union Square Brentano's literary emporium became firmly established as a literary center for New York. So widely known was Brentano's, and the people who used it as a meeting place, that *Every Saturday*, one of the most widely read weeklies of the day, printed an article on the bookshop about 1872, briefly sketching the career of the man who had established it and ending up with the advice that "all visitors to New York City must be sure to include this literary emporium on their list, for there they are sure to see the writers of the day."



One of Brentano's earliest advertisements from a newspaper in 1869.

It was not only the writers of the day that might be seen at No. 33 but also artists, painters, sportsmen and the big business men of the city. Cornelius Vanderbilt, who was nearing the end of his career, was living on Washington Place not far from Union Square and was a patron of Brentano's. So was Peter Cooper, who, in addition to amassing his tremendous fortune, was most interested in popular education. It was Mr. Cooper who gave to the city Cooper Union, dedicated to the teaching of craftsmanship, and still a leading factor in American education. The building was erected in 1859 and Mr. Cooper's foresight was so great that he insisted that the architect leave a shaft in Cooper Union running from the basement to the roof.

"Some day some fellow is going to invent some sort of a platform which will fit in that shaft and folks won't have to walk upstairs," was Mr. Cooper's comment. Of course, time showed he was right.

By this time, the middle seventies, the "Century Crowd" were beginning to be known, and New York was assuming some of the literary glory that had previously belonged entirely to Boston. Frank Stockton, who was the editor of *St. Nicholas* and also the author of the delightfully humorous *Rudder Grange* worked at the *Century* office on North Union Square—so did Richard Watson Gilder. Richard Watson Gilder was the editor of the *Century Magazine* and he revolutionized the writing profession in America, by establishing the practice of paying for manuscripts as soon as he accepted them and printing the signatures of the writers in a conspicuous place. Most magazines never allowed an author's signature to appear, and of course the fact that the *Century* did brought to Mr. Gilder the first choice of all work of the best-known writers of America. And the close proximity of Mr. Brentano's bookstore to the *Century* office naturally meant that these writers "dropped in" to look over a book or magazine. There, too, they knew they were apt to meet a friend, perhaps William Dean Howells, H. G. Bunner or Brander Matthews.

Brentano's was also a gathering place for the people of the theater. Augustin Daly, one of the greatest actor-author-producers this country has ever known, said that he always went to Brentano's and "strayed through the atmosphere of plots" when he was writing a new play. The elder E. H. Sothern and his son, who is still playing, had charge accounts, so did Lester Wallack and Maurice Barrymore, Mr. Barrymore being the distinguished actor-father of Ethel, Lionel and John Barrymore of our day. Edwin Booth lived close by and was almost a daily visitor when not "playing on the road."

Mr. Brentano was always much interested in young people and he thoroughly sympathized with those who were fighting their way toward success—no matter what their objective. Young writers and artists could

browse in his shop seeking inspiration for hours and he was eager to say a helpful word to them, and how many of them found their inspiration there can only be guessed.

During the eighties, Mr. Brentano began to feel that his years of work warranted a vacation. He had no children of his own, but when his three nephews were old enough to work he had given them positions in the store. Now he allowed these nephews, August, Simon and Arthur, to buy the business from him. Arthur, by the way, is still at the head of Brentano's. Then August Brentano decided that he would like to make a tour of the world. The most famous citizens of New York vied with one another in giving him farewell parties and finally he set out with Montreal as his first stopping point. But the spell of the bookshop was on him—he never went farther than Montreal, and even though he had disposed of the business he came back to occupy his chair behind the cashier's desk until the time of his death in 1886.

*Where Big Men Browsed Among Books*

But the atmosphere that Mr. Brentano had established for his store did not cease to exist with his passing—Brentano's had become as much a part of New York City as the City Hall itself, for the spell of books had cast itself firmly over the United States, and even then we were known as a great reading nation.

When the dictates of fashion changed the swiftly growing city and Union Square became "downtown" Brentano's moved up to the Madison Square section where it was located for almost twenty years. The same atmosphere that had pervaded the Union Square stores—the business occupied two locations on the Square during the thirty-odd years it was in that locality—was successfully moved uptown. Writers and artists were as welcome as ever to "browse" and young men and women found in the place a source of inspiration. One of the things of which the firm is justly proud is that several young men of literary aspiration had found employment there in the days before they reached success, notably Phillip H. Bartholomae, who later wrote "Over Night" and other successful comedies, for the American theater, thus becoming a personage of note.

Personages!

Woodrow Wilson was for years a devotee of the shop, buying not only his books, but all his magazines at Brentano's when he was in New York, and General John Pershing, whenever possible, slips away from the responsibilities that crowd about him when he is in town to find the companionship that lies in a book. Chauncey Depew, Fannie Hurst, John Drew, George Arliss, Gertrude Atherton, Francis Wilson, Robert W. Chambers, Charles Dana Gibson, Edna Ferber; all are present-day "regulars" at Brentano's who saunter fascinated before the shelves.

*Magic That Troops From the Pages of a Book*

And when the passing of time found Madison Square out from the beaten path of those who frequented the bookstore—Brentano's moved farther uptown, carrying, of course, to their new quarters that same delightful disregard for the rush and hurry of the modern city that had made the original bookshop a sanctuary for the book lover, famous folk or otherwise, who wish to slip away even for a few minutes and find the magic that troops from the pages of a book.

# Sherwood Anderson

(*Concluded from page 19*)

daily stint of a thousand words, Sherwood Anderson's steady output is not attained by a set daily writing schedule.

"I like writing," he confessed. "For me it is no task. The smell of ink is like good wine to me, so every day I write until I am tired out and I go to bed thinking of nothing but what I want to write in the morning. Never was such a scribbler as I became and am even now. Ink, paper and pencils are cheap and I have taken full advantage of that fact, and have written hundreds of thousands of words which I have afterward thrown away. Some people have told me that all should have been thrown away," he added naïvely.

"Where do you gather your material?" I asked.

"I have never consciously gathered material anywhere, or by any method, certainly not from newspapers. I do not use plots—do not believe in them. There is a notion that stories must be built about a plot and that they must point a moral, or uplift and make better citizens. The magazines are filled with these plot stories. I call it 'The Poison Plot' as the plot notion seems to me to poison all story-telling. What is wanted, it seems to me, is form, not plot. Plots are frameworks about which stories are to be constructed and editors seem extremely fond of them. One gets an idea for a story. What is meant is that a new trick has been thought out. Nearly all the adventure stories and the well-known western stories are so constructed."

Evidently Anderson feels a sincere obligation toward the characters he creates.

"The materials of the prose writer are human lives. To him these figures of his fancy should be as real as living people. He should be no more ready to sell them out than he would sell out his men friends or the woman he loves. To take the lives of these people and bend or twist them to suit the needs of some cleverly thought-out plot, to give your reader a false emotion, is as mean and ignoble as to sell out living men and women."

*The Growth of the Modern Magazine*

The old triangle plot of two men struggling for the same girl or vice versa, ending happily and with a punch, does not interest him. He depicts the individual's confused inner life and its frustration; showing the individual as he really lives inside and that same individual as he acts in organized society. It is the struggle between surfaces and depths in the same man, not man's struggle with nature or with other men, that interests him.

Anderson blames the spirit of standardization, growing out of an industrial age, for the lack of distinction of present-day magazine fiction. He believes the modern magazine grew out of the demand for standardization of taste and material desires.

"The magazine with a circulation of a million or two million became not unusual," said Anderson. "The real purpose of such magazines was to create, through advertising, nation-wide demand for certain commodities. The magazines were business institutions run by business men with business ends in view. They have served their purpose admirably, and taken for what they are no man can quarrel with them. But we cannot spend our hours of leisure just looking at advertisements. We have to be intrigued into the pages of the magazines. The commercialization of the arts followed as a natural result.

*Writers Should Not Sell Their Birthright*

"The popular writer is just the man of talent who is willing to sell his talent to the business man who publishes the magazine, or to the book publisher after large sales. There is a job to be done and he does it, keeping his eyes always on the main chance, that is to say, on the great unthinking public.

"There are worse fates than being poor. If a writer has talent he should not sell out his birthright. My own belief is that there never was a people in the world more anxious for men of talent to stay on the track and be true to the crafts than the Americans. We all know something is wrong with the flood of cheap work we are always getting."

"What is your own favorite novel or character?" I asked finally.

"I like them all," he replied, "but do not like the way I have set some of them down."

# O. Henry in Light and Shadow

(*Continued from page 3*)

pictured the delights of a journey to Venetian Italy, India and Japan, dismissed him because she thought he was a "cheap skate," who wanted her to marry him and go to Coney Island on a wedding trip?

Once, as the New York *Sun* observes editorially, there were those who questioned the durability of O. Henry's fame. They pointed out his "overindulgence" in malapropisms; to the fact that many of his best tales required for full appreciation intimate knowledge of the popular slang, or song, or political situation of the moment of writing. That intimate knowledge, such critics urged, a later generation would lack. But today, fifteen years after his death, O. Henry's popularity seems to have waxed rather than waned. Millions of copies of his books have been sold, and no few of them in insular England.

Of the many letters he wrote me, as author to editor, one of the last, written in pencil on yellow paper such as he used in writing his stories, was dated December 5, 1909, from Asheville, North Carolina, where he was staying with his wife and her family, vainly endeavoring to recover his creative energy. In it he expresses the hope of returning to New York to spend Christmas, but the state of his health was such that he did not leave Asheville until some weeks later.

If he realized that the shadow of death was hovering over him at the time, there is no intimation of it in the letter. This, however, was characteristic of his indomitable courage and inherent optimism. The "eventful night" referred to was the occasion of my marriage, at which he had officiated as "best man." The unfinished story he mentions was never completed, but was posthumously published in its unfinished condition, with an appended conclusion written by one of my associates on *Hampton's Magazine*. As for the letter:

"I've been intending to write you for a long time, but, the fact is, I haven't written a line of MS. & scarcely a letter since I've been down here. I've been putting in all my time trying to get back in good shape again. The simple life has been the thing I needed, and by or before Christmas I expect to be at work again in better condition than ever.

"It's as lonesome down here as Broadway when you are broke, but I shall try to stick it out a couple of weeks or so longer—I hope in time to wet my ears in a crock of Tom & Jerry with you at the glad Yule Tide.

"Tell *Hampton's* not to get discouraged about the story. It'll come pretty soon, & be all the better for the wait. As I said, I haven't sent out a line since I've been here—haven't earned a cent; just lived on nerve & persimmons.

"Hope you'll get your project through all right, & make a million.

"With the same old fraternal & nocturnal regards, I remain, Yours as usual S. P.

One of O. Henry's haunts—in the lower east side of New York, with its pushcarts and trash.

"P. S. I got a bill from the N. Y. Transportation Co. a few days ago for $20—the auto hire for the eventful night. I kind of suspect that you will have to pay it direct, as I haven't seen a twenty since the war. It strikes me that maybe I forgot to tell you that I hadn't paid it before I left town, so you can say that you thought it had been settled by truly

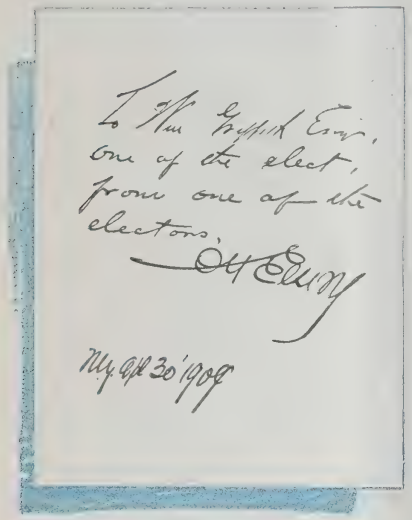
Yours, S. P."

Another characteristic letter, which also throws a light on his method of composition, came to me at an earlier date and refers to one of the stories (I am unable to recall exactly which one) included in the collection entitled *Roads of Destiny*. I remember, however, calling at his apartment on West Twenty-sixth Street, New York, in response to his telephonic directions to "come early and walk right up and knock soberly three times on the door," and receiving from him an autographed copy of that book which had just arrived from his publisher. The complimentary inscription reads, "To Wm. Griffith, Esq., one of the elect, from one of the electors, O. Henry, N. Y. April 30, 1909." And the admonitory letter, which bears no other date than Friday, evidently was inspired by my repeated requests for a story long overdue. His reference, in the second sentence, to rewriting the story is explained by the fact that it had been submitted under a different title to another magazine and had been rejected. The letter says:

"Keep your shirt on. I found that I had to re-write the story when it came in. I am sending part of it just so you will have something tangible to remind you that you can't measure the water from the Pierian spring in spoonfuls.

"I've got the story in much better form; & I'll have the rest of it ready this evening.

"I'm sorry to have delayed it; but it's best for both of us to have it a little late & a good deal better.



"I'll send over the rest before closing time this afternoon or the first thing in the morning. In its revised form, I'm much better pleased with it."

London needed Charles Dickens no more than New York needed O. Henry as a chronicler of fictional fact, and it is equally true that O. Henry needed New York, where his constant, underlying purpose was to find material for short stories, and to live incidentally. There is a good deal of autobiography in the sentences with which he introduces *He Also Serves:*

"If I could have a thousand years—just one little thousand years—more of life, I might, in that time, draw near enough to true Romance to touch the hem of her robe. Up from ships men come, and from waste places and forest and road and garret and cellar to maunder to me in strangely distributed words of the things they have seen and considered. The recording of their tales is no more than a matter of ears and fingers. There are only two fates I dread—deafness and writer's cramp."

Yes, it is beyond peradventure that this fine, tender-hearted candidate for immortality dreaded death less than the loss of his powers of observation and ability to express himself in fiction. Death came to him, not after a long and lingering illness, but rather suddenly, although somber signals of warning had been flying for several months.

During the latter part of May, 1910, he returned to New York from Asheville, and telephoned me to join him at the Hotel Chelsea, on West Twenty-third street, to "review the past and rehearse the future." An unforgettable remark he made on that occasion—and one that reveals how foreign to him was the thought of death—was "New York is my oyster,

and I'm a-goin' to crack it wide open, yet." A short time afterward we spent an early Wednesday evening at his favorite pastime, bowling; and his zest was astonishing, considering that he was to die within a few days. When the last game had been played, he rolled a handful of coins down the alley to the pin boys, and we adjourned to a nearby hotel to dine. In the course of the evening I ventured the suggestion that the time had come for him to undertake a novel, or at least a more sustained, if not more serious and purposeful, story than he had yet attempted.

"That's just what I intend to do," he replied; and proceeded to outline a tale that he planned to run about forty thousand words, which he was "going to get at right away." It was our last meeting.

*When O. Henry Made His Last Call*

Three nights later he was alone in his apartment in the Caledonia, when the infirmities that he had been fighting with such quiet courage suddenly got the mastery. He managed to reach the telephone and call a friend who was living in the neighborhood; then the receiver fell from his hand and he sank to the floor. The receiver remaining off the hook some length of time, and no voices on the wire, the switchboard operator was convinced that something was wrong. He summoned the superintendent, who found O. Henry lying unconscious where he had fallen.

The stricken author was hurried to a nearby hospital, on entering which and being asked what name he should be registered under, he answered: "Call me Dennis; my name will be Dennis in the morning." He had great difficulty in breathing, being subject to a bronchial weakness which had long dissuaded him from smoking, and had to be propped up with pillows. Through the night he retained consciousness and knew that death was approaching. An hour before dawn, just as the attending physician was leaving, O. Henry looked up with a little quizzical smile, and said: "Put the pillows up higher—I don't want to go home in the dark." He died shortly after daybreak of a bright Sabbath June morning.

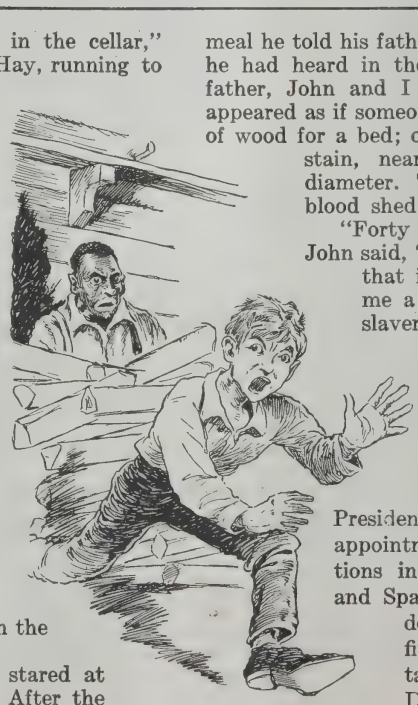
*It Was Before Daybreak on a Sunday*

A mutual friend and magazine editor, Gilman Hall, happened to call for O. Henry at his apartment that morning, and learned what had transpired. In answer to his telephone message, I hurried to meet him at the hospital, and there, to our amazement, we were unable to learn where the body of our friend might be found. Neither his real nor his pen name was on the hospital register, and the day force had succeeded the night attendants who had supervised the removal of the body to an obscure auxiliary undertaking establishment not far from the hospital. More than two hours went by before we located the place, and satisfied ourselves as to the identity of the great writer.

At my suggestion, informal arrangements were made for a semi-public funeral service at the Little Church Around the Corner, on East Twenty-ninth street. It seemed the most appropriate place for the last rites of one who had celebrated the church in his stories; and we who arranged it are responsible for the quiet simplicity of the service, which has since been criticized.

By a strange confusion of arrangements, a wedding was to have been conducted at the church at the same hour affixed for the funeral service; and as the wedding party alighted from automobiles at the door, the sexton, black-gloved, professionally somber, greeted its members with the startling announcement that "The funeral of O. Henry is to be held at eleven."

The best man went to the rector, the late Dr. Houghton, who explained that a blunder had been made, and suggested that "The only thing to be done is for the bride and groom to wait an hour. I will marry them at noon." The pallbearers were waiting, just within the churchyard, for the hearse to arrive.



*When Sorrow and Happiness Met Each Other*

"Wouldn't O. Henry have enjoyed this?" remarked one of his friends in the sedate assemblage. . . .

"Life is made up of sobs, sniffles and smiles, with sniffles predominating," wrote the author of *The Gifts of the Magi*. It was peculiarly fitting that, in the closing paragraph of his life, Sorrow and Happiness should jostle each other.

# John Hay's "Ghost"

"THERE are ghosts in the cellar," cried little John Hay, running to his brother with big, scared eyes. "One of them spoke to me: 'Little Master, for the love of God, bring me a drink of water.'"

Charles Hay tells of the incident:

"John was so frightened that he hurried upstairs and went to his room. Next day my father stated at dinner that three runaway slaves had been overtaken by a party of officers from Missouri and the slaves had resisted arrest. One was captured, one was fired on and killed, and the third was wounded but escaped in the woods.

"My brother John stared at me but said nothing. After the meal he told his father about the voice he had heard in the basement. My father, John and I investigated. It appeared as if someone had used a pile of wood for a bed; on it was a blood-stain, nearly 18 inches in diameter. This was probably blood shed by the runaway.

"Forty years afterward, John said, 'I will never forget that incident. It gave me a greater horror of slavery than anything I ever heard or read.'"

Following Lincoln's election, Hay went to the Capital as assistant to the President. Then came an appointment to the legations in France, Austria and Spain. Under President Hayes he was first assistant Secretary of State.—F. D. H.

# Seventy-five Years of an Ideal—Antioch College

(*Concluded from page 2*)

She also recalled various love affairs, which again were a very natural reaction in a coeducational school, and in which the comic as well as the more serious element was not lacking. There was, for instance, the charming but flirtatious young lady, one of whose admirers mistook her gay friendliness for something more. From the theological school where he had gone from Antioch, he sent back to her a proposal of marriage. Before he met her, he averred, he had been able to give his entire heart to Jesus; now, however, he had only a divided love to offer. Rather scared, the young lady begged her brother to answer for her. This he did by unsympathetically scrawling across the letter, "Better confine your affections to Jesus," and returning it to the writer.

The "charming and flirtatious young lady," whose gay friendliness was taken by one of her admirers for something more.

Another young lady had a Quaker admirer who thus naively expressed his feelings: "Until I knew *thee*, Susanna, I could place everything upon the altar, a free offering to the Lord. But whenever I puts *thee* on, thee always slips off!"

Antioch's deeply seated idealism seems to have been ineradicable, although changing more or less both in object and form as the years passed on. Under Horace Mann, life was real, life was earnest, and frivolity was not its goal; but a more generous suavity characterized the later régimes. Thomas Hill, a brilliant scholar, became the second president of Antioch, but soon left to become president of Harvard, and a period followed in which the little college barely kept alive. Then, in the late sixties and early seventies, there were a few years of beautiful efflorescence under the presidency of Dr. George W. Hosmer. This was a golden period for the students, a period of keen interest in natural history under such inspired teachers as Edward Orton and Edward Waller Claypole; of admirable work in the classics under William Allen and others, of awakening interest in philosophy and German literature under Stanley Hall, and in English literature under James K. Hosmer.

Once more, too, famous guests visited the college: Isabella Bird Bishop in the height of her fame as a world traveler; Athanase Cocquerel, French liberal divine and author; A. Bronson Alcott who was reverently regarded, less on his own account, I fear, than because he was the father of the author of *Little Women;* William Rounceville Alger, who delighted his young audience with first-hand stories and descriptions of Emerson, Longfellow, Lowell and Holmes. And, above all, there was Edward Everett Hale, a trustee, good friend and frequent visitor, who was felt by the students, with much reason, to be their own particular "famous" man. He read to them in the college chapel *My Double and How He Undid Me,* and the immortal *Man Without a Country.* One evening, too, he met them informally at Dr. Hosmer's, and talked to them inspiringly of their civic duties—duties to their town or village, however small, and to their fellow citizens as well as to the country at large.

Of this golden period, Frederick Meakin (class of '74) has written:

"In Antioch as I knew her, along with the passion for work, and a generous hospitality to all forms of thought, there was on the whole a surprising geniality and soundness of tone, without too much religious phrasing or a too self-conscious morality. The hard work of a really good education is in itself a moral discipline, and that work had begun to tell. Quiet toil and steady self-development took the place there of the pretense and the noisy display which divert so much of the world's attention from the world's proper work, and obscure the fact that the roots of the virtues, intellectual and moral, must thrive, if at all, under ground."

With Dr. Hosmer's resignation, the college again declined. Financial troubles became acute, for the endowment fund, always small, had shrunk, and with it the teaching force and the student body. President Long, nevertheless, held things together for nearly eighteen years, and President (now Senator) Fess for another seven or eight: no small achievements, these; since for a good deal of the time the college "niver knawed w'ere a meal's to be 'ad." But one thing never failed her, that high idealism which was as the breath of life in her worn body, and which once again, under the presidency of Arthur E. Morgan, has won out. Antioch now enters upon a new period of activity.

Its technique differs in many respects from the old, but it is Antioch still, even to the small detail that it is not yet a millionaire institution. Its dominant principle may be described as the budget system applied not merely to its finances, but, primarily, to the all-round development of its students. "Nowhere else," said Horace Mann in his inaugural address, "have there been such waste and loss of treasure, as in the waste and loss of the human faculties. All spendthrift profusions, all royal prodigalities, are parsimony and niggardliness, compared with the ungathered, abandoned treasures of the human soul."

President Morgan, too, has felt deeply this tragic waste, and the Antioch of today is his effort toward its redemption—a superb yet practical vision of balanced, coördinated training of mind and body. And as, after all, the measure of achievement is its nearness to the end proposed, the new Antioch in its four years of existence has, so far, measured high. At the very least it is, as Miss Tarbell said of it, "a spirited adventure." To my thinking, however, it is not only that, but more—an enterprise founded on the rock of common sense, and illumined by the light of a high ideal—"the light that never was on land or sea." To vary the metaphor: it is the flame borne on by the torchbearer, passed from one hand to another, faint at times but never extinguished, and ever borne forward.

*Floreat Antiochia!*

The Cascade, Yellow Springs, Ohio, now property of Antioch College.

# Sorting Out People

"Idea man."

(*Continued from page 4*)

*The Man Who Looks In:* He is timid, self-conscious; he doesn't shine in a crowd; he cannot make a good speech. He is embarrassed upon meeting people, he doesn't show up well at a first meeting; he hasn't the flashy way about him so many people have. He is suffering from an inferiority complex. Then sometimes he talks a great deal just to show that he isn't afraid. He searches his ideas, and he does that surprising thing for a human being: he changes his ideas, for most people have their ideas handed to them by someone else at the age of fifteen and the coffin lid closes down upon them unchanged and unaired.

Rarely does a person change his idea on religion, politics, morality or divorce after he is fifteen. He is happier if he doesn't. There isn't nearly so much worrying and stewing around if you make up your mind once and for all and let nothing under high heaven alter it. But *The Man Who Looks In* isn't that kind. He is constantly taking his opinions out and examining them and brushing off the moth. He isn't content to lie on a bed someone else has made.

Left—"The man who looks in."

Below—"The man who looks out."

*The Man Who Looks Out:* He is the objective type. He thinks the same as his father thought; ideas slide over him like water across linoleum. They rarely ever soak in. He has voted the same ticket since he was twenty-one; he is *right;* the rest of the world is *wrong.* He is interested in physical contests—which side is going to win. You can hear him at any baseball game shouting a lung loose. He thinks that the League of Nations is something in Europe. The only leagues he is interested in are the National and American.

*Those Who Live on Superiority:* They think there is nobody quite so good as they are—just why no one is able to find out. Their children are too good to play with neighbor children. These people live in isolated superiority, looking down upon their neighbors, picking out small faults in others, which they themselves do not have, and placing everybody else beneath themselves.

It's just awfully hard for them to find anybody good enough with whom to associate. They don't get on with their neighbors, they don't get on with people at church, and they work in offices filled with "boobs." They can never keep their maids—their maids are just perfect devils. These people go about with a chip on their shoulder and feel slighted if somebody doesn't come along and knock it off. They are chip carriers; they usually have small funerals.

"Superiority."

*Big Fronts:* They are flashy, showy people who make a great impression on you at the first meeting—simply sweep you off your feet. Their talk is filled with mentions of rich and famous people they know, reference to "My cousin, Senator Alfalfa," "My dear friend, Count Thinblood," and "Do you know Mrs. Handfed of Baltimore?" Of course, you don't. Then they manage to convey the information that she is the richest woman in that worthy city and that the two are simply Siamese twins. "Gee," you say to yourself, "she must call Mrs. Coolidge 'Grace,' and Mrs. Vanderbilt must ring up every morning to have a chat just to start the day." They live on gossip; they wallow in it; they can start with a pinfeather and make a feather duster out of it. And then you meet them again. This time they don't seem quite so wonderful and charming. All they've got is in the show window. Keep on walking, they aren't worth looking in.

"Big front."

*Inchworms:* They are small, narrow, little people who go inching along through life, their heads on the ground, without ever getting a glimpse of the big, beautiful, wonderful things in the world. They are occupied by their own small rounds, small worries, little tasks. The biggest thrill of their lives is dinner time. Their chief ambition is to get to the movies early and grab a seat in the middle of the house. After the show is over they drop into the drug store and take home a pint of ice cream—and another big day is over.

They have little or no company, they rarely go anywhere, they take little interest in anything farther away than the front gate; they themselves and their dog and their son Sam—that is their world. They usually have small places in life, small routine jobs where they don't have to get all "het" up by thinking. They go inching along until finally the doctor comes silently out and asks for the names of the nearest relatives. They have lived but they have missed *life.* The world is too full of them. They were born inchworms and they will die with their back in a hump.

"Inchworms."

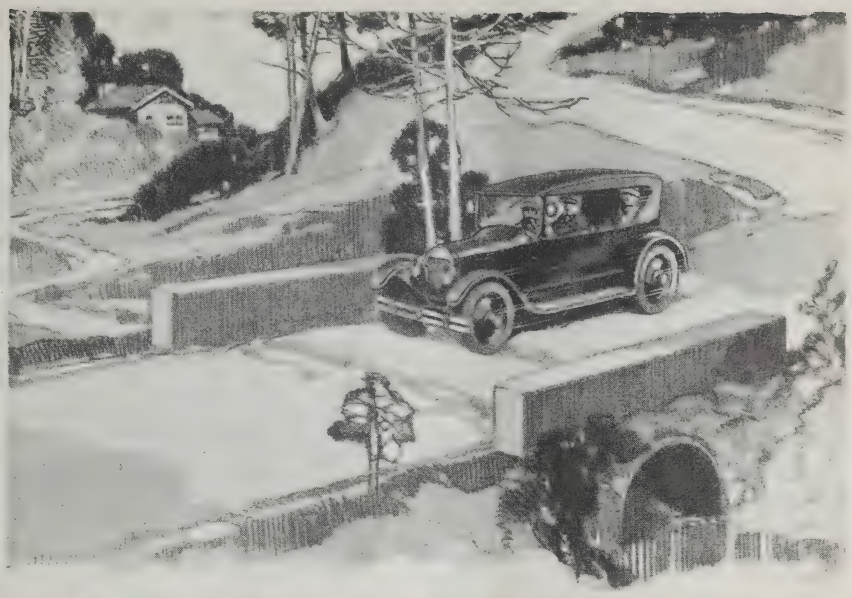
Of course, there are are smaller individual groups: There are the town grouch, the town eccentric, the wild boy, the gadabout wife, the complaining husband, the miser, and so on; but I mean these classifications are ways to sort your apples. They are not accurate because a thousand and one psychological and psychoanalytical differences come in—complexes, repressions, racial traits, inherited characteristics, and so on. People cross and recross, have a little of this and a little of that, but once you get the main division straight you can work out the lesser traits little by little.

Here are some of my own personal methods for picking out the boxes into which people go:

Listen to what the person talks about—baseball, bridge, money, gossip; notice what pops up oftenest in his conversation. People hover about their treasure.

Listen to what the person says about other people. Is he generous toward others, or small and petty? Does he harp on shortcomings? Is his conversation a scrubboard for the neighborhood dirty linen?

Watch the person react to a new idea. Is he always against anything new? The idea may have to do with the matter of church members dancing, or a new school bond or what not. Watch him react, then check up.

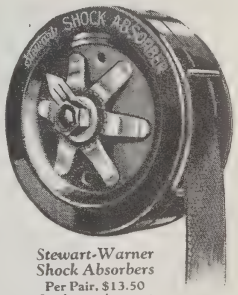


Is the person timid? Many people are and the average person talking to them never suspects it. The timid person is continually protecting himself by covering up. To disguise his real feeling he will often be bold and blunt and sometimes rude. Don't be misled by these outer indications—strip them off. Go to bed rock.

Does the person have opinions or merely prejudices? Try to get at what is behind his answers; does he deliver them on the spur of the moment without reflection and then stick to them because he is afraid it would lessen his dignity to admit that he is wrong? Try to determine if he really wishes to exchange ideas or merely to argue.

Who are the person's friends? It is the old story of birds of a feather. What does the person do when he seeks pleasure? What kind of people does he admire most?

Is the person a halfway man? In reaching an opinion of a person, try to get at whether he goes through with a thing or stops when the sledding grows hard. So many people in this world start off with a brilliant display of fireworks and end up a dud. They start this and they start that—and never quite put either over. Pick the all-the-way-through man even though he isn't as brilliant in the beginning.



And, lastly, don't be fooled by education or lack of education. So many are apt to put a person down as smart if he has been to college and a gump if he hasn't. Nothing is further from the truth.

# Sail Over the Bumps with Stewart-Warner Shock Absorbers-

INNOCENT looking "humps" in the road are often the ones that cause the greatest damage. When you see a slight rise in the road—such as a culvert or small bridge bed—you are very apt to "sail" right over it. You can do it with Stewart-Warner Shock Absorbers in perfect comfort and safety—but without them your family will "hit the roof" or your steering wheel jump out of your hands. Isn't it far better to have Stewart-Warner Shock Absorbers than to "bounce" you know not where?

Any dealer can install them, and you will marvel at the difference they make in the riding comfort of your car.

Madam Curie, discoverer of radium, recently saw for the first time the places from which her experimental ore had been brought, when she visited Czecho-Slovakia as a guest of that government.

# Why GUM-DIPPING Is So Important to Light Car Owners

Light car owners accustomed to extraordinary dependability of performance in every mechanical feature of the car—find that same unfailing character of service in Firestone tires.

Gum-Dipping, the exclusive Firestone process, impregnates and insulates every fiber of every cord with rubber—after which the cords are put through the regular calendering process.

The result is extra strength for the cords and minimum internal friction and heat—giving greater endurance that insures longer mileage and low cost—with added safety for rough winter roads or treacherous ice-covered pavements.

Buy Firestone tires now—benefit by the advantages of Gum-Dipping, found only in these big tires identified by the Mark of Quality that assures you—

## A PSALM

Thou visitest the earth, and
waterest it:
Thou greatly enrichest it with the
river of God, which is full of
water:
Thou providest them corn, when
thou hast so prepared the earth.
Thou waterest the ridges thereof
abundantly:
Thou settlest the furrows thereof:
Thou makest it soft with showers.
Thou blessest the springing thereof.
Thou crownest the year with thy
goodness;
And thy paths drop fatness.
They drop upon the pastures of
the wilderness:
And the little hills rejoice on every
side.
The pastures are clothed with
flocks;
The valleys also are covered with
corn;
They shout for joy, they also sing.

CHRONICLER OF THE NEGLECTED TRUTH

# BRIEFLY TOLD

To continue the work of creating new plants and flowers, Stanford University proposes to take over Luther Burbank's experimental farm.

Though it is claimed that man has been on the earth 500,000 years, half his knowledge and control of nature has come within the last hundred years.

Harvard in 1642 was the scene of the first commencement exercises held in North America.

There was little improvement in Western Europe's agriculture from the fall of the Roman Empire to the beginning of the nineteenth century.

Peter the Great founded the Russian Academy of Science at what is now called Leningrad, in 1725.

"Turn, boys, turn, we're going back," were not the legendary words of General Phil Sheridan, when he completed the famous ride which has been celebrated in song and story. In an interview recently given, the General's widow said that the exact text of the command could best be expressed by dashes and asterisks.

It is estimated that the 11,000 tenants in the New York Equitable Building could get out in twenty minutes.

According to Scie Tou Fa, a Chinese official in Paris, America was discovered by the Chinese. He asserts that the first Spanish explorers in South America and Mexico were struck by the resemblance of the architecture there with that of the Far East. One Aztec divinity had an elephant head, which, he says, must certainly have come from Asia. A figure of Buddha was found in Mexico.

The ear of the katydid is situated in the tibia of the front leg.

Copper poisons have been found in ten per cent of the "bootleg" liquors that have been analyzed in Massachusetts.

The largest grain elevator in the world is that of the Canadian National Railways at Port Arthur and Fort William, holding 9,500,000 bushels.

In an effort to make his insects produce to the maximum a British Columbia apiarist has shipped 30 pounds of bees and ten queens to Auckland, New Zealand, where summer is just beginning, in the hopes of harvesting a crop of honey this winter.

If sugar from dahlia and artichoke tubers can be grown to supplement sugar beets, California sugar manufacturers may soon run their factories all the year round.

Nearly 100,000 goats, 2,000,000 horses and cattle, and 6,000,000 sheep are now grazing under permit in the National Forests of the United States.

John Muir wrote of Mount ainier's beautiful flowers: "This is the richest subalpine garden I ever found, a perfect floral elysium."

When Magellan circumnavigated the globe his command was, "Follow the flagship and ask no questions."

Tobacco is not used for smoking by the Indians of Santa Marta, Colombia, but it enters into their ceremonial form of greeting.

The ordinary house fly makes 330 wing-beats per second, which is probably the world record for rapidity among all natural fliers.

The first hen's egg laid in Spitzbergen has been mounted on a little stand and a suitable inscription placed on it. Artificial heat and sunlight must be supplied the hens of the new hennery which promises to be a success. Until recently hens were unknown in Spitzbergen.

Straight roads that offer an opportunity for speeding are more dangerous than curved roads, according to Wisconsin figures.

As an American family was about to leave Tokio for San Francisco, they found their twelve-year-old daughter missing. The father of the girl put his collie on her trail and in less than a minute before the train was to leave, the dog arrived with the missing girl.

In Africa the white ant is pounded into a paste and is considered a food delicacy.

The original "Royal" hybrid walnut tree on Luther Burbank's farm has for 15 years paid in nuts and grafts an annual interest of 6 per cent on $10,000.

Dr. F. G. Banting, famous for his work with diabetes, believes that the continued use of insulin will not only alleviate this disease but cure it.

Low-flying airplanes are frightening the chickens of Santa Rosa, California, to the extent that they are refusing to lay eggs. The county board of supervisors of Sonoma County have ordered aviators to fly higher when going over that region.

Lemon rinds are now utilized for the manufacture of pectin, the substance that makes jelly "jell."

A small fragment of the Bible, dating from the Emperor Constantine, has been found in a collection of parchments by Professor Bus. The fragment is probably a portion of one of the fifty handwritten Scriptures which Constantine ordered distributed throughout the Greek colonies.

There are no storms or hurricanes on the Island of St. Helena. In the course of sixty years only two flashes of lightning were recorded. There are no motor cars, no lawyers there, and only five policemen.

Naturalists connected with the MacMillan expedition report finding blue grass in the Arctic regions. Purple sandpipers have also been obtained in their first plumage, which is unknown to most ornithologists.

# Presented in this Issue:

Mr. Ford's Page this week discusses whether "division" or creation is the better solution of the problem of distribution.

Quincy Kilby, a votary of the stage, disposes of the question whether Shakespeare wrote Shakespeare's plays. And something more; he asks whether Shakespeare mentions any man or woman of his own time. Mr. Kilby's question and answer are interesting. (p. 2)

Air investigations are an endless chain. There have been scores of them. E. B. Johns, for many years on the *Army and Navy Journal*, has investigated the air investigations, clearing the atmosphere, as it were, of some of the things that obstruct flying efficiency. This aerial review of reviews gives an entirely new perspective. (p. 3)

LeRoy Hamilton, Mayor of Cuero, Texas, writes as follows:

The Editor,
THE DEARBORN INDEPENDENT.

Dear Sir:

I have just read the article in your issue of the 10th under the heading of "Plunging Over the Precipice of Debt."

I agree with you heartily that something is radically wrong with the way our city governments have been and are spending money, but I believe the fault is not so much with the officials as it is with the people themselves who put the officials in office. . . .

People have found out that by taxing the other fellow they can have their cake and eat it too, and so the wild scramble to enhance the value of the country fellows' land by taxing it goes on. The result is that the ownership of any kind of property has become unattractive to the owner and he wants to sell, and let the other fellow pay the bill. Unfortunately the man who owns nothing at all has found out that ownership has become unattractive and so is not in the market for anything that can be levied on by the tax assessor. . . .

The thought of Socialism used to frighten me but it no longer bothers me because we already have it. Our property is just paying rent to the government and eventually a title to a piece of property will mean the right to live on it as long as rent is forthcoming to the government. . . .

Yours very truly,
Le Roy Hamilton.

Some taxes yield a good return to the investor in the shape of security and stability, and others are absorbed like vapor but give no refreshing rain in return. A good tax should be like mercy—blessing him who gives and him who takes. The estate taxes and death duties don't do this. Marian Bruce Clark declares they have a blighting effect on industry and development. (p. 5)

It is a common fallacy that animals have instincts but that human beings have none, only intelligence. Perhaps our forefathers had less intelligence than we had, but their instincts were stronger. Dr. Donald A. Laird discusses this matter. He asks whether the human race may not be losing those instincts. Are we becoming less self-reliant, more collective in our reasoning, more dependent in our actions and decisions? (p. 6)

"When is a bet not a bet?" Change the "when" to "where" and the answer is "Ohio." Many devices are used to evade the gambling laws. Purses, pools and premiums all come under review in this illuminating little talk. (p. 8)

We must concede that our forbears had better taste in mural decoration than we have. The wall papers of those days were both pleasant and instructive. Even Benjamin Franklin took an interest in having pleasing and artistic wall papers. There were pictures of actual scenes and current events as well as of birds and flowers, and very faithfully done, too, in these antique wall coverings. Mary Harrod Northend tells us all about it. (p. 12)

The name of "Buffalo Bill" will continue as long as Young America lasts—the last of the Scouts. Here is a story of the great Plainsman as Showman. An artist went to live with the show: here are his impressions and pictures. (p. 16)

We frequently hear of merchants who impose upon their customers. Did you ever hear of customers who impose on the merchants? There is much that is illuminative in the merchant's end of the story. Edward J. Beck gives that side as he heard it in many interviews he has had on the matter. (p. 21)

Ralph Waldo Emerson said that he could do without the world. Anyway there are "other worlds than ours," as Professor Moulton tells us in an interview with J. V. Nash, but they appear to be well-disciplined worlds: the traffic system of the skies is very exemplary; planets don't collide with one another to their mutual destruction. It will be hundreds of millions of years before the sun gets near enough the earth to cause inconvenience. Professor Moulton knows the heavens better than most of us know our backdoors. (p. 30)

In this number, a preacher discourses on business, and gives us some angles not by any means ecclesiastical; and Louis Worthington Smith paints a word picture of Sydney Carton, the hero of what many consider to be Dickens' greatest novel. (pp. 25, 28)

# Did Shakespeare Mention a Contemporary?

## A Passionate Pilgrimage in Search of Light on a Controversial Subject

By QUINCY KILBY

THE question at the head of this article seems to be one that people in general have ignored, taking it for granted that Shakespeare like every other great writer often talked about those who were living in his own time. But did he? Did he in any of his writings, prose or poetry, ever mention any contemporary—sovereign or sycophant, magistrate or mummer?

My attention was first drawn to this subject when one Sunday evening many years ago Robert G. Ingersoll was lecturing on Shakespeare at the Boston Theater, of which I was then treasurer. In the course of conversation his manager, Mr. Farrell, who was also his brother-in-law, spoke of how strange it was that in none of his works did Shakespeare ever mention a contemporary. The idea was new to me and so when the next day I met Traveler Ball on the street I asked him about it. That gentleman, Mr. W. T. W. Ball, an Englishman by birth, gained his soubriquet by being for many years connected with the Boston *Traveler* as dramatic critic, and was looked upon as being an authority on Shakespeare.

"Let me see," he said, almost immediately adding, "Yes, he did. In his poem *The Passionate Pilgrim* he spoke of Edmund Spenser and John Dowdell, both of whom lived in his own time. I think you will find the allusion in the fifth canto."

I went home and consulted my copy of Knight's *Shakespeare*, finding that in the fifth canto he did mention both Edmund Spenser the poet and John Dowdell the musician, the idea being to ask which one would prefer to be, the writer of the song or the composer of its music. Thereupon I wrote to Mr. Farrell giving the dates of birth and death of all three men and saying that Shakespeare did mention by name Edmund Spenser and John Dowdell, adding "Now will you be good?"

In a few days came the response that it was now pretty generally admitted that Shakespeare did not write *The Passionate Pilgrim*. When I next met Mr. Ball I said to him, "They tell me Shakespeare did not write *The Passionate Pilgrim*. How about it?" He pondered a minute and then observed: "I'll see you soon," and disappeared in the direction of the Boston Public Library. In a short time he came to my office with the statement that it was now acknowledged that Shakespeare did write *The Passionate Pilgrim*, all but the fifth canto. And as the fifth canto was the one with the contemporaries in it, I was still up against a blank wall.

A few years later I was visiting the house in Stratford-on-Avon where the poet was born. In each room was stationed a custodian, fully equipped for answering questions. I told my story to one of these gentlemen and he replied that Shakespeare did mention two contemporaries, one being Giulio Romani, the Italian painter, and the other Sir William Lucy. Not Sir Thomas Lucy. He was the magistrate who sentenced the poet for poaching the deer and was afterward caricatured by him as Justice Shallow in *The Merry Wives of Windsor*. Sir William was a different individual and the poet thought better of him.

There the matter rested for fourteen years, until in 1923 I visited Stratford once more and found a different man in charge in the same room and spoke to him on the subject. It appeared that in the Shakespeare Memorial Theater that same evening there was to be a performance of *The Taming of the Shrew*, and on one of the showcases a first folio edition lay open at the prologue to that play, the one that deals with the Christopher Sly episode. The custodian called my attention to an allusion to a public house kept by one Marion Hackett, informing me that records showed that at the time the drama was supposed to occur, which was Shakespeare's own time, there was at Windsor a public house kept by a woman named Marion Hackett, thus making her the third contemporary mentioned by the immortal bard, the painter and the knight being the others.

Anyone who fancies that Bacon wrote Shakespeare's works will soon be disillusioned by a visit to Stratford-on-Avon. One of the rooms was in charge of a lady who was fully primed on the subject. She called my attention to the fact that Bacon, the "wisest, wittiest, meanest of mankind," was always most accurate in his writing, never making any mistakes, while Shakespeare made them by the thousand.

An author may have two very different styles of writing, as for instance Ray Stannard Baker, who as David Grayson produces very different material from his own special line; but an accurate man could hardly bring himself continuously to write inaccurately. She showed me a book printed in the early years of the seventeenth century, while the dramatist was still alive, which stated that the author of the plays was William Shakespeare and he lived at Stratford-on-Avon. In another book that I saw, also printed during Shakespeare's lifetime, the author spoke of the great writers then living in England, mentioning Ben Jonson, Edmund Spenser, Lord Bacon, Beaumont and Fletcher, William Shakespeare, Ford and Massinger, and others. This is very significant.

Another fact often overlooked is that Shakespeare, a hundred years before there ever was an English dictionary, used more words, and new definitions of old words, than Bacon had in his entire vocabulary. This also speaks for itself.

Some years ago I found in a Boston paper a poem written by John Ludlow and published in the New York *World* that is to me beautiful and most convincing. It is called—

# Investigating the Air Investigations

## A Review of Reviews Relating to Matters Still Very Much in the Air

By E. B. JOHNS

AFTER having followed fourteen investigations of the Army and Navy as they relate to the Air Service, I hold strong convictions as to Colonel Mitchell's proposals." This was my statement upon leaving the staff of the *Army and Navy Journal* after more than twenty years of service on that publication.

More mature thought, however, convinces me that I was in error as to the number of investigations that have been conducted to determine the possibilities and limitations of aviation. I stopped counting when the returns showed about twenty-five major and more than a hundred and twenty minor investigations. The work of tracing all of the investigations must be left to some historian.

And the end is not in sight if the Senators and members who are to sit in the next Congress are correctly quoted. As a taxpayer, I suggest that if the next Congress is determined to start on another career of investigation, it investigate the investigations of the Air Service that have already taken place. It should appoint a large committee with a number of subcommittees so that the work can be distributed among the subcommittees and completed before Congress adjourns. There should be a subcommittee on the Congressional investigations, one on the War Department investigations, one on the Navy Department, and one on the Post Office Department investigation. Perhaps the largest committee and the busiest one would be the subcommittee to investigate the investigations of the Air Service that have been ordered from the White House. Another might be needed to look into the investigations that have been conducted by aëronautical societies and private citizens who have taken an interest in this subject. When these numerous investigations have been carefully studied, I venture to predict that any fair-minded committee will reach the conclusion that about all that can be said on the subject has been submitted to some committee, although Colonel Mitchell insists that "half has not yet been told."

Exposing myself to the dangers of starting a historical controversy, I am going to hand to Charlie Strobel the honor of conducting the first investigation of the possibility of a heavier-than-air machine. I think it was in 1902 when Charlie Strobel was managing Knabenshue who, after the first successful flight of a dirigible at the St. Louis Fair, was giving exhibitions at county fairs. I met Mr. Strobel at Washington, and told him that some of the members of the General Staff of the Army were interested in the performance of Knabenshue. He consented to go to the War Department with me and there divulged the fact that he had been conducting a quiet investigation of the efforts of the Wright brothers to build a "real flying machine," as he expressed it.

"Take it from me," said Charlie, "those boys will soon startle the world. I am trying to sign them up for some real flying shows. If they will go into the game with me, we will all make a fortune."

As I was then representing the Toledo *Blade*, in addition to the *Army and Navy Journal*, I promptly put a story on the wire as Knabenshue was a Toldeo man and Mr. Strobel was formerly manager of the Toledo baseball team. Shortly afterward, one of the members of the *Blade* staff dropped me a note in which he more than insinuated that Charlie must have been buying something that is now sold only by the bootleggers. Anyhow, the story landed on the front page and as it was not signed, I was not mentioned in the shots that the editorial paragraphers took at it.

Passing over the ancient history of aviation which led to the publication by the War Department of a quaint advertisement for a heavier-than-air machine shortly after the Strobel investigation, and the first flight at Fort Myers, Virginia, of the Wright machine sponsored by the War Department, let us plunge into the numerous investigations that took place after the United States was drawn into the World War. Aviation was in the early experimental stage when this country declared war against the Central Powers. Congress had not given either the Army or the Navy adequate funds to make even preliminary investigations or experiments. But when war was declared the limit was removed on the funds that were appropriated for aviation

"I stopped counting when the returns showed about twenty-five major and more than one hundred and twenty minor investigations."

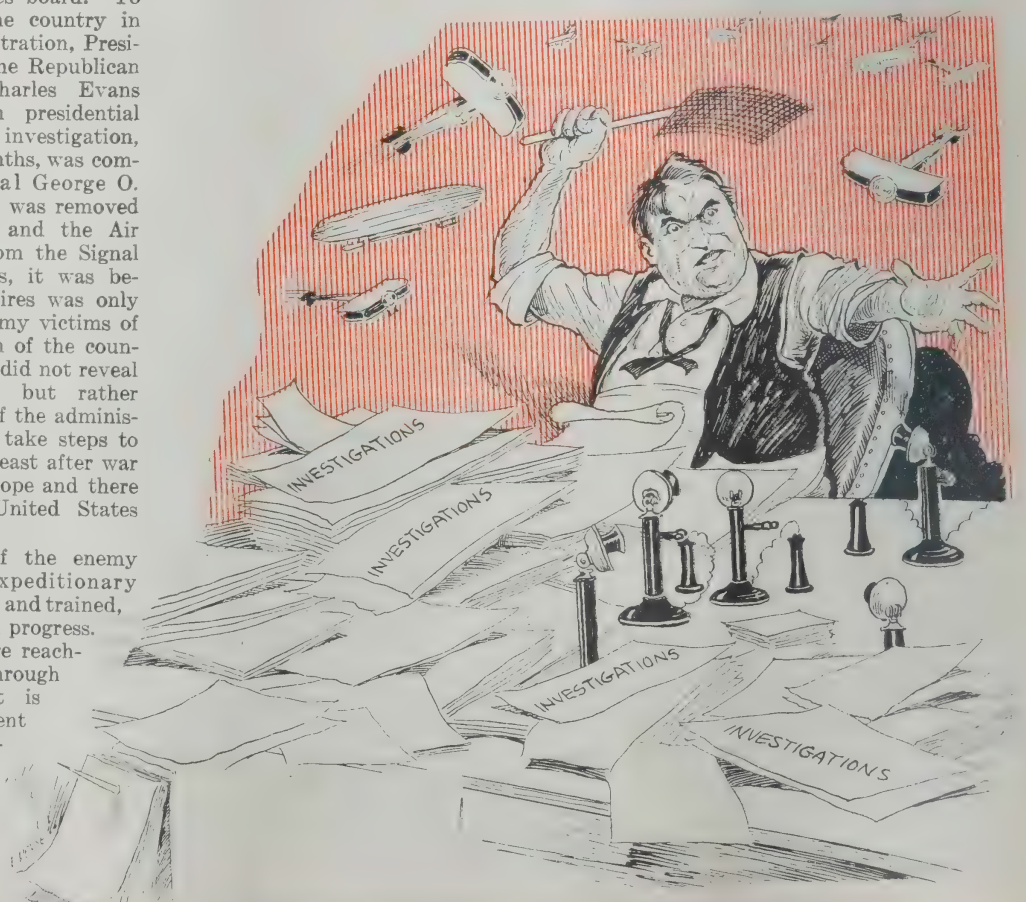
and all other war or near war purposes. The day after the appropriations were made, your average statesman expected to look out of his office on Capitol Hill and see the air full of flyers. In a month or two, the country was thoroughly aroused not only on account of the lack of airplanes but because the American soldiers were not on the firing line in France.

Among the thousands of real patriotic people who rushed to Washington with ideas which they were confident would win the war, was Gutzon Borglum, the sculptor. Mr. Borglum held strong convictions that a combination of German traitors and corrupt interests was holding back aviation production and that if there was not an exposure the war would be lost. He succeeded in securing a number of interviews with President Wilson who he claimed authorized him to conduct a confidential and secret investigation. In October of 1917 Mr. Borglum went to the White House to submit his report to the President. At the same time, he gave out a synopsis of it to the press. Mr. Borglum was firmly convinced that the country should be aroused to appreciate what he thought was a perilous situation, and was willing to defy the war censorship that was in effect at that time.

While President Wilson entered serious objections to Mr. Borglum's method, he appointed the Hughes board. To restore confidence of the country in the efforts of his administration, President Wilson went into the Republican party and selected Charles Evans Hughes, the opposition presidential candidate. Before the investigation, which extended four months, was completed, Major General George O. Squires, U.S.A., Retired, was removed as Chief Signal Officer and the Air Service was separated from the Signal Corps. In Army circles, it was believed that General Squires was only one of several regular army victims of the unprepared condition of the country. The Hughes report did not reveal any serious corruption but rather brought out the failure of the administration and Congress to take steps to prepare the country, at least after war had been declared in Europe and there were dangers of the United States being drawn into it.

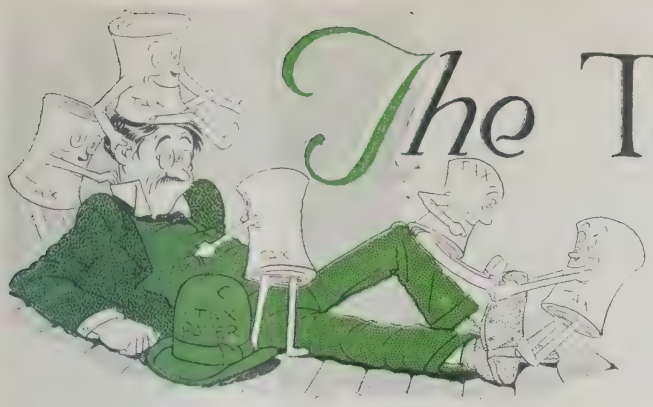
Even in the face of the enemy while the American Expeditionary Force was being organized and trained, air investigations were in progress. So many complaints were reaching the White House through confidential channels it is stated that the President sent a number of temporary officers overseas to investigate the condition of the American Air Service. Colonel E. Lester Jones, the present chief of the Coast and Geodetic Survey, and a personal friend of President Wilson, is credited with being one of the air investigators of the American Expeditionary Force. The President was not content with the report that came from General Pershing through official channels, but it is stated ordered a number of private investigations.

The records of the American Expeditionary Force show that Colonel William Mitchell had scarcely landed in France before he became restive. He had very little faith in the plans of General Pershing or of General Headquarters. He had an ambition to lead an air offensive against the German lines and felt that he was being restrained from winning the war.



In the meantime, complaints from the commanders of the ground force that Colonel Mitchell was not coöperating with them in conducting operations were continually pouring into the headquarters of the corps, armies, and General (Concluded on page 26)

With all respect to Colonel Mitchell, he is not the Army and Navy of the United States. Yet his utterances are given columns, pages, reams of publicity, where official Army and Navy utterances are wholly suppressed. It is not fair. It is exceedingly bad public policy. A nation trained to suspect its Army and Navy will just as quickly suspect Mitchell, were he our war lord.



In view of the widespread and complete suppression by the American press of the facts which responsible and representative Army and Navy officials have to give, THE DEARBORN INDEPENDENT has decided to redress the balance as far as possible by letting Americans read what their defense representatives have to say *at first hand.*

This does not indicate a policy favoring Army and Navy contentions against Mitchell contentions in the present controversy. It indicates our belief that no controversy is fair or American that does not give the people the whole truth on both sides.

This is the first of a series of articles on the question of airplanes in the American defense scheme.

"The busiest one would be the subcommittee to investigate the investigations of the Air Service."

# The Tax Muddle

## Is Destruction and Not Construction the Result of Some of Our Taxation?

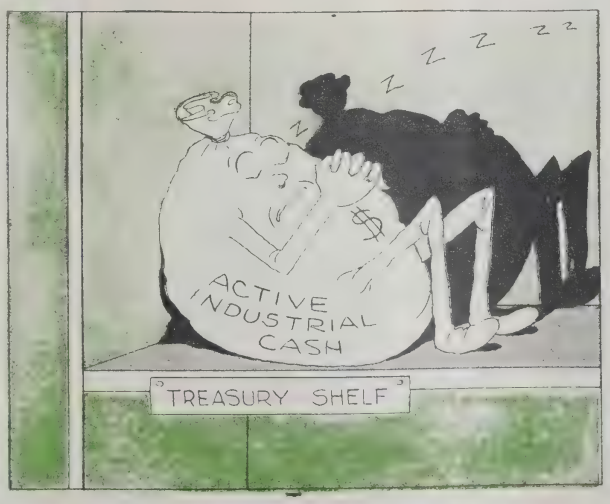
By MARIAN BRUCE CLARK

SINCE that parent of all taxation, the tax called "the twentieth," was levied during the reign of Julius Caesar, ships of state have been wont to steer clear of the pitfalls of multiple jurisdiction. Today, as in the past, the cry is "taxation for revenue only" and no political manipulation for the sake of expediency should be permitted to shift the bulk of responsibility for that revenue to any particular class of the population.

When Adam Smith said, "All taxes upon the transference of property of every kind, so far as they diminish the capital of that property, tends to diminish the funds destined for the maintenance of labor," he spoke, not for a day nor for a generation, but for all time.

Since all taxes are returnable in cash, the estate tax, as at present administered, operates today to "diminish the funds destined for labor." The law says that the tax shall be returnable one year from the death of the decedent and that it shall be payable in cash. In the settlement of the simplest estate of minimum value the time required for its administration is approximately one year; how then, in an estate involving millions of dollars in assets and obligations, as well as responsibility for the welfare of thousands of employes, can the bulk of its holdings be converted into cash without immense sacrifice and loss of values, destructive curtailment of operation, reduction of output, unemployment and shrinkage through forced liquidation? The answer is, *it cannot be done.* In such industrial curtailment the direct hardship falls not upon the legatee but upon the laborer.

From three to four months' time is frequently devoted by an expert auditor in the Treasury Department to the auditing of one large estate, and this after the way has been prepared by the orderly arrangement of the return compiled by the accountants for the estate. Whereas the original accounting involved the primary arrangement of stock-taking, the government examination is in reality only a re-audit. Therefore, it must be apparent that the physical conversion into cash of the bulk of a large estate cannot be accomplished without excessive loss and disturbance of business, when limited to a stated period of time. Industrial operations under normal conditions require huge cash assets, payment of estate taxes causes this cash to be withdrawn from its normal use and paid into the government where a large proportion of it immediately becomes inoperative, since the government, again to quote Adam Smith, "seldom maintains any but unproductive laborers."



Taxes may not be paid through the medium of notes or other negotiable securities, Liberty bonds excepted, by means of which normal business is so largely conducted. Accounts receivable or other forms of long-term credits are not acceptable to Uncle Sam. The Treasury is the original "cash and carry" organization, so that while the revenues of an inherited business are found to be carried on upon a credit basis, the payment of the estate tax must be altogether on a cash basis, nor is the time extension granted by the law of any material benefit.

The additional cost of administration involved, the uncertainty of sustained values, the "substantial first payment" and the interest-bearing residue altogether counterbalance any apparent advantage. In fact, out of an average of some 14,000 estates annually audited by the Treasury less than ten per cent have availed themselves of the time extension provision, obviously for the reasons just stated.

It has been shown that the nation is under the condition of unregulated and, in the opinion of many, unconstitutional taxation resulting in demoralization of business, destruction of initiative, forced liquidation and an unhealthy money market; oftentimes destroying at one blow what has taken a generation to build up. The social, economic and industrial welfare of a nation are inseparably interlocked with its business interests; one cannot be impaired without affecting the other.

Inconsistency is rampant. So-called "exempt securities" are not exempt when they are inherited. Securities under the estate tax are not securities, they are "*privileges*" and as such are taxed at a much higher rate than as straight income. While the estate tax was obviously devised for the purpose of breaking up concentrated wealth, the gift tax operates to keep that wealth intact.

As of December 31, 1923, the outstanding valuation of tax-exempt securities was $14,900,000,000; on December 31, 1924, the value had increased to $16,000,000,000; while on August 31, 1925, the amount was $17,000,000,000, of which only $2,700,000,000 was held by the government. From these figures two deductions may be made: first, the amount of money being withdrawn from productive channels for investment in exempt securities is increasing at an alarming rate, and secondly, the revenue of the government resulting from this deflection is rapidly de- (Concluded on page 27)

"Payment of estate taxes causes this cash to be withdrawn from its normal use and paid into the government where a large portion of it becomes inoperative."

Your father had instincts. His conduct, thoughts, and abilities were controlled by these mysterious "springs of conduct."

It is very doubtful if you have the instincts that your father had. Your thoughts and daily actions may be very similar to his, but it is not wise to say that those mysterious instincts of his prompt your doings. The daily conduct of your children may lead those who know the family to say, "Just like his grandfather," or "Just like his father." But the children, even when grown, are very likely to be without all instincts!

Is the human race losing its instincts? What has happened to them?

Thereby hangs a tale,one loaded with significance for those who follow the nuances of human thinking.

# How Your Instincts Have Disappeared

## Are Men Like Kites Without Stability?

By DONALD A. LAIRD, Ph D.

IMAGINE a giant kite soaring in the heavens, steady through all the cross currents of the atmosphere: a kite that has been in the skies since the beginning of human life on earth and the beginning of human thoughts.

The kite is stabilized by a flexible tail, the end of which is cracked by the winds like the lash of a whip. A sudden shift in the wind causes the tail to lash severely. One day—eighteen centuries ago—such a wind strained the farthermost end of the tail to such an extent that it was partly severed from the remainder.

The kite represents philosophy. The tail represents the body of human knowledge and information by which the kite is stabilized. But notice: the kite keeps this knowledge up in the air!

About eighteen centuries ago Galen lived—an ancient physician who did much to bring medical knowledge down to earth. His experimentation and actual study of anatomy was a great stimulus to bring basic medical knowledge down to earth—down to actual observable fact and away from the high altitude of speculation.

He was unable to bring it entirely down to earth, however. He represents the cross current in the air which *partly* severed the tail from the kite. Consciously, or unconsciously, he was restrained by the trend of philosophical thought of that time. This is shown in his describing an alleged bone in which the soul was supposed to dwell.

Then came the vitriolic young Frenchman, Vesalius. It is said that one day he threw Galen's text on anatomy at his medical professor and stalked out of the classroom. He thought the tail should be entirely severed. He found many sympathetic ears among the medical students who could understand that anatomy and physiology as written by Galen in 150 A. D. might not be up to date at 1550 A. D. Together they made the most of their opportunities to study *human* anatomy by actual dissection, and rejected the assumption of the study of animals showing how human beings were put together and worked.

So about 1550 there was an unusually vigorous and sudden breeze which completely severed this section of the kite's tail with a zip-p-pp still echoing. Basic medical knowledge came down to earth. The source of authority shifted from the armchair to the laboratory, and the shortened tail unsteadied the kite of philosophy. But it helped medicine and ailing humans!

There is the kite, its tail shortened, carried unsteadily by every slight breeze, dangerously near crashing down to the tree tops, if not down to earth. Darting through the azure with more force and unexpected turns the tail naturally received more lashings.

And soon another section ripped and came wafting down to earth. Alchemy came down to earth, into the laboratory, and became chemistry. Other sections of the tail followed with unexpected suddenness and we find human knowledge expanding by leaps and bounds while *speculative* thinking suffers. But humanity benefits!

Stubbornly one section of the tail clung to the kite. Fifty years ago you could have seen it hanging on tenaciously. This is the knowledge of the human mind—psychology. There were a few broken threads but through thick and thin this fragment of the tail stuck like a brother.

Dr. Wilhelm Wundt left the study of physiology and inaugurated the first psychological laboratory at the University of Leipzig—another thread severed. J. McKeen Cattell started a laboratory for the study of mental problems at the University of Pennsylvania and another thread snapped.

Perhaps fifteen years ago the remaining threads were strained beyond their strength and the knowledge of psychology came down to earth. You may not have heard the shriek of the outraged kite as the science of thought and conduct broke off relations, but if you were to pick up almost any

psychological journal for this month you would find some of the old guard shrieking at the top of their lungs because psychology came down out of the air, put its feet on solid ground, and began to play with the other sciences who had also rudely left the armchair.

Sociology, economics, politics, are still clinging to the kite. There are many severed threads, however, and some day we may see them playing around on the ground with the rest of us. I can assure them that nowhere will they find a better group of playfellows. The thrill of a lifetime awaits upon them when they make their first laboratory discovery.

Your grandfather, you, your children, your business, your country have been vitally influenced by this kite. Especially does this last fragment of the tail to come down to earth influence you. In human significance it ranks next to the grounding of medicine. On a par with these will rank the grounding of politics, and how this is starting I shall point out in a later article.

Your grandfather, we have said, had instincts. Multitudinous ones. So did the lower animals, but grandfather was assumed to have more. We can obtain some insight into how the instincts were supposed to work when grandfather decided to buy a new suit by noting a splendid example of instinctive behavior in an insect.

Along the southern arm of San Francisco Bay are extensive salt marshes. Over these is a dense growth of pickle-weed except for some small splotches of barren sand which are covered with a sun-baked crust of salt, deposited at times of unusually high tide.

If you were at one of these sand areas in September you would see female digger wasps cut a small disc of the salty crust carefully away. Removing this disc unbroken she digs a miniature well with her jaws, being careful to leave a "flange" of soil to retain the crust disc when it is later replaced.

When the well is about three inches deep the crust is replaced temporarily, the particles of sand she has dug are carefully concealed in the dense pickle-weed, and she flies away. Perhaps fifteen minutes later we see her return, flying low because in her jaws she is carrying an inchworm which is limp and paralyzed. The lid is removed, the worm deposited in the pit, the lid replaced, and the wasp flies off again in quest of another victim to paralyze with her sting and deposit in the pit with its unfortunate predecessor.

Six worms are placed in the pit. Then she lingers with them a while and lays her eggs on the body of the last worm, gluing them fast to the worm, which will furnish food for the young when the eggs are hatched. The eggs laid, she replaces the sand which was removed to make the well which she lined with both life and death. Then the top disc of salty crust is replaced, bits of sand placed along the seam the disc makes, and these bits tamped down firmly with her horny head.

What an elaborate undertaking, accomplished so accurately! A female digger wasp shows the foresight of a general in enemy territory in the way she carefully secretes the bits of sand she removed from the pit, in the way she replaces the disc of crust every time she departs for another inchworm, in the way she paralyzes the worms by stinging—she does not kill them, but paralyzes them so that her young will have fresh food when the eggs hatch.

Elaborate, accurate, good generalship—and a female digger wasp does all this without ever having seen another wasp do it! That is instinct in an insect. We could give hundreds of examples of similar instinctive activities.

They are actions of a complicated sort which it is not necessary for one to learn to perform. Sneezing we do not need to learn, but it is not an instinct: too simple, a mere reflex act.

The digger wasp sometimes shows more "instinctive intelligence" than do human babes!

Grandfather, as a grown man, was supposed to have many instincts, too. Remember, though, that when grandfather lived the threads of the kite tail were starting to give way to let psychology come down to earth. When grandfather was in his prime Cattell was just starting the psychological laboratory at the University of Pennsylvania.

Like lower animals, he was supposed to have a hunting instinct. He was also supposed to have a collecting instinct, like the squirrels, thus explaining stamp collections and assortments of locks of hair, sometimes enough of the latter to fill a mattress. Then there was the instinct of migration which prompted going on vacations and some persons becoming tramps. And there were kindliness, teasing, tormenting, love, shame, bullying, adornment, play, and cleanliness. The last in spite of the fact that psychologists in grandfather's day probably had small boys.

Two decades ago it was asserted that 80 per cent of man's behavior could be traced directly to such things as these. That was from the armchair. Eighty per cent of our behavior may be given to teasing, migrating, hunting, and so on, but these are not instinctive. They are acquired, not inborn. They are learned, not inherited. Laboratory studies are demonstrating that *scarcely one-half of one per cent of our alleged instincts are instincts.*

Have you ever noticed a small boy dig frantically in the back yard—or as likely right in the front yard—until he had excavated a fair-sized hole? If it had been your grandfather digging away well-informed observers would have watched him—without interfering?—and said: "His instincts are now in the cave-man period." For instincts were conjectured to unfold in the way in which the race had evolved. A little earlier they might have observed grandfather building a playhouse in the crotch of a tree when they would have said: "His instincts are now in the simian period." Then when they noticed him swaying back and forth in front of the fireplace or were bothered by his squirming in bed they remarked: "There! He is now going through the fish stage in his instincts."

I know these sound ridiculous to you, but pick up any text in psychology which is a decade old and you will probably find the same illustrations used seriously. They are used seriously here, too, for they show the general method by which the entire instinct-logic operated.

Pick up the principal textbooks of psychology originating in England today, and you will find instinctive behavior of man greatly emphasized. Pick up a book by McDougall, of Harvard, and you will find the

(*Concluded on page 18*)

# When Is a Bet Not a Bet?

By HARRY PENCE

IN localities where betting in any form is prevalent the remark is often heard, "It is easier to convict a man of murder than of gambling." And the truth of the observation is seldom if ever disputed.

There seems always to be a way to get around the brute fact that wagers are made and money changes hands for other considerations than value received. The genius devoted to the invention of devices and subterfuges designed to cloak purely gambling transactions with a semblance of legitimacy and legality would, if altruistically directed, devise equally clever and efficient means for the alleviation of many human ills.

Gambling on the results of horse races is a felony in the State of Ohio. The law is clear, and so, it would seem, are the facts. Upon half a dozen race tracks thousands of men and hundreds of women walk up to the windows where mutual tickets are sold, put down their money and take their tickets. They then witness the running of the race and when the odds are computed the holders of winning tickets line up at another row of windows and receive in actual money the amount for which their tickets call.

There is no concealment. It is all done in the open for the world to witness. Brown says to Jones, "I bet on So-and-So." Brown and Jones regard the transaction as a bet. It looks like a bet. It has all the aspect of a bet. A cash stake is put up, a hazard is taken and the stake won or lost as it would be were it a bet.

But is it a bet, or a wager? Is it gambling within the meaning of the law?

The promoters of the game say that it is not. In proof they ask the public to read and note the backs of their tickets. On the reverse of all mutual tickets is printed,

> "This acknowledges the receipt of the sum of____Dollars voluntarily contributed by the holder hereof as a part of the purse, prize or premium to be awarded to the owner of the horse winning first, second or third place (as the case may be) in the race designated by this ticket."

Now it is perfectly legitimate for race tracks to operate and to offer first, second, third or any number of prizes to the owners of the horses.

If it can be construed that by buying a ticket on a horse the purchaser thereby becomes a part owner or even a participator in the purse or premium—if the mutual pool can also constructively be regarded as a part of the purse, et cetera, et cetera—there is a presumption that might appeal to a highly trained legal mind.

Puzzling over it a bit one begins to doubt.

At any rate at least two new racing plants were constructed last year on the possibility that the courts might legalize this fiction. The matter is in the hands of the court. The cases are pending and while the deliberate process of justice proceeds the tracks are operating on the presumption that the contention of their promoters is valid.

Verily it is easier to convict a man of murder than of gambling even when the law and the facts are clear and easier, much easier, when the issue is confused if even by so transparent a bit of verbal bunk.

## How Scotland Nearly Lost Burns

ONCE the poet Burns was on the point of being lost to Scotland, and it was a dog that was the cause of it. This is how it happened:

One day, Burns, then about twenty-six years of age, went to see the races at Mauchline in the county of Ayr with his dog at his heels. The family had recently moved from the town of Ayr, where the poet was born, to the farm of Mossgiel. At the close of the races a dance was given and Burns' dog, still following at his heels, tracked him through the dance, to the great amusement of the lads and lasses present.

This caused the young plowman poet to remark in the same jocular vein: "I wish I could get one of the lasses to like me as well as my dog does." The challenge was accepted.

Some time afterward Burns was in Mauchline again, his dog following him. In passing the house of Jean Armour, the comely daughter of a master mason, the dog ran into the yard where Jean was spreading out clothes on the bleaching green. The dog, as dogs will do, ran over the white linen before it could be stopped by its master, and Jean asked the young man to call him off, at the same time half in jest, and perchance wholly in earnest, asking whether "he had yet got any of the lasses to like him as well as his dog did."

This was the beginning of a long and ardent attachment between the poet and the mason's daughter. In its earlier stages the love-making developed into Burns being forbidden the house and threatened with a lawsuit. The minions of the law got on his track and Burns in a sense became a fugitive. Here is what he wrote to a friend of his early manhood:

> My hour is now come—you and I will never meet in Britain more. I have orders, within three weeks at farthest, to repair aboard the Nancy, Captain Smith, from Clyde to Jamaica, and to call at Antigua.

But it was not to be. The friends of the poet, moved by his misfortune, put their heads together and determined to subscribe for the publication of a volume of his poems. Up to this time, Burns, in his spare moments, had written much, but had not had the opportunity or the means of publishing anything. The result was the famous Kilmarnock edition, under the modest title of *Poems, Chiefly in the Scottish Dialect*, by Robert Burns.

The edition was one of six hundred copies, and it netted the author about a hundred dollars. A small sum truly, but sufficient to make Burns famous. Copies of the Kilmarnock edition now sell for more than five thousand dollars.

# MR. FORD'S PAGE

SHALL we divide wealth and so have less, or create wealth and so have more? Wealth, of course, being the things that men use, the commodities of life. This definition has to be made because the world still stupidly believes that money is wealth. And then it complains of the money power! The only power which the money-brokers wield is that given them by the people's belief that money is wealth. If money is wealth, why do we bother with bakeries and textile mills and farms and machine shops?

In the belief that wealth is money, and that there is just so much of it to go round, the ignorant of the world conceive a plan to seize the money and divide it. On several occasions they have succeeded, but somehow the money never was divided and the real wealth—food, shelter, clothing, security, convenience, all commodities of life—ceased to exist. As often as that ignorant method is tried, that same result will follow.

Insofar as this is a protest against money and in favor of true wealth, it is intelligible; but it needs instruction. The wealth-creators of the world are the only potent enemies of the money-brokers and money-kings. Neither money nor its broker-owners can create wealth; but when a real wealth-creator appears, he makes money and its brokers a secondary matter. The fight then begins to get control of him; as long as he continues to create wealth, he is safe; when he begins merely to "make money," he is gone, the money-brokers become his masters.

The greatest blows dealt to the anti-social forces of money and oppression are dealt by the producers of wealth. When the producers of wealth are induced, as they were in Russia, to cease that production and enter a mad scramble for the money, they simply deliver themselves into the hands of the money-brokers again, and in deeper bondage than before. In this sense, revolutions are always favorable to the money-brokers.

This is the simple principle, whose clear perception will do what all the idealists, reformers and honest revolutionaries are seeking: that equality is in possession and not deprival, and that possession is always possible through creation.

That is, if the world wants what its social spokesman says it wants, let it create it. Everything it wants is accessible. More accessible than ever before. Productive work, even fifty years ago, was much more difficult. But now more methods are known, natural resources are more abundant, ways and means have multiplied. The earth—which is the source of all our wealth—is an open door, compared with what it was to our fathers. All the wealth, all the raw material of wealth, all supply of physical needs, all future services, all inventions, all the means of development are here; they await the creative activity of man. Dividing what we have is nothing; creating more is our job.

*MOST radical social reform schemes assume that division instead of creation will solve the problem of the distribution of wealth. Division is decrease; creation is increase. Wealth (which is not money) cannot help flowing when enough is created. In Russia they "divided" the houses instead of building them; result, a worse condition than before. In America we do not "divide," we increase houses, and are in consequence the best housed nation in the world. "Division" means that there is nothing more to be had, that natural resources and human ingenuity are exhausted. This is false. Any man can get what any man has got by making it. Resources abound.*

Does anyone suppose that dividing the money is going to have any effect on this? It will have none at all.

In Russia they divided up the houses. In America we do not divide up the houses. Why? Because in America we say, "Any man can get a house without taking one away from his neighbor. Let him go get a house where his neighbor got one." How did his neighbor get one? He created it by his labor. When society begins to seize houses for general division, it is acting as if there were no more wood, or stones, or clay out of which to make bricks; no more labor, no more knowledge of how to construct houses, no more market for houses, nor more people to be housed.

That precisely is the belief of those who are always talking about dividing up; they assume that there is no more to be had. This is the basic fallacy. There is more wealth waiting to be owned and used than is now or ever has been known. There can be no owner or user of wealth except the man who creates it. Sources of natural wealth are not exhausted. The only thing that seems to be exhausted is the ingenuity and energy of those who want what others have, instead of wanting what is their own.

In the last analysis, no one can have anything that others have; one can only have one's own; and one's own is the product of one's ingenuity and energy combined. The more he makes for himself the more, inevitably, he makes for others. The less he makes for himself, the less there is for anyone, and then comes the diseased state of mind which suggests that dividing the other man's product equalizes the wealth of the world. It never has; it dissipates the wealth of the world.

## *Should the Poor Have Children?*

THE very interesting president of the University of Michigan is reported in the press to favor, among other things, the decrease of children in the families of the poor. He says that in other families the deliberate limitation of offspring is already practiced. It is not a new proposal, but somehow it fails to lose, even with excessive repetition, its power to nauseate the reason. It is always the poor! Yet nobody defines the poor. The poor are those who live in the back street. But the boys of the back street usually become the bosses of the boys raised in the front street, fifteen years hence, and the girls are likely to be the wives and mothers of a race virile enough to save the country from the shrinkage in morals and energy that will come upon it through "limited families." For selfishness is the great immorality.

Where are the poor? And what have the other classes, who can give their children "all the advantages," to promise for tomorrow? The poor of yesterday are in the seats of power today, and the families of yesterday that "had all the advantages" are going to seed. It may be something in a boy's favor that he has to go to work at fifteen (if the Constitution of the United States continues to permit him that much liberty) and thus escape the University, which more than any industrial system molds men down to robots. Forbidden all the "advantages" he may have a chance to make his way in life.

It may be possible one day to compel the poor to cease having children, but it is greatly to be hoped that no law will be proposed to compel the other classes to make up the deficiency. For the impression one gains from all this talk about limitation is that those who deliberately effect it are thereby conferring great benefit on the country. Those who can be brought into that camp do well by society in leaving no descendants. Meantime the "school of hard knocks" will continue to have the most distinguished sons and daughters.

## *Consistency*

IT BEING the New York fashion to spurn the northern white race and all that it stands for, it is not surprising that so facile a voice as that of S. Parkes Cadman, D.D., head of so facile a committee as the Federated Council of Churches, should join in the deprecatory chorus. There is something truly wonderful in a Nordic joining in the alien claque of aspersion upon his people. Of course, it is not unintelligible: the northern white race has a unique power of self-criticism which sometimes operates without proper consideration and leads it to join in other races' attacks upon it.

However, the distinguished clergyman slipped a cog in the Brooklyn address wherein his remarks are found: when it came to advising his audience of young men how to shape their characters, how to build their minds, how to equip their powers, he was Nordic to the core. He sent them to Shakespeare, Milton, Bunyan, even our American Lowell, the English Bible, all of them preëminently influential, unapproachable in excellence—and Nordic.

Not that one approves the term "Nordic" nor all for which it is made to stand, but there is danger of its enemies making it a great name. "The disciples were called Christians first in Antioch."

## *The Child Poet*

THERE is some discussion about the ability of a Brooklyn child to write the poems which now fill two volumes and are ascribed to her genius. The maturely intellectual give divergent answers, and all in all there is a murky atmosphere thrown around some of the most delightful lines that have appeared in this country for a long time. Edwin Markham, himself a poet of world distinction, has his doubts about it. Others, equally thoughtful, say, Why not? In a world where so much deception is being practiced the mere hint of it is sufficient to arouse a hue and cry.

Meantime, there is the poetry, and there is childhood, and there are Wordsworth's lines about the proximity of heaven to our infancy, and there are the prodigies of history. Poetry is essentially childlike. It is the straight, clear vision of childhood, unwarped by the pressure of hard experience, that makes poetry possible at all.

The disputants, however, seem to have overlooked one test. They have been busy asking, "Could a child do this?" There is another question which should be asked, "Could an adult do this?" We should like to see such an adult. Some have for a moment approximated it—with a fairy-like return to the mind of their childhood—but who has sus-

tained it? We should like to see the adult who would enter the lists with the child.

This twelve-year-old girl who can say, "I know all about the stars," and who can write the story of a seed carried between a camel's toes to an oasis in the desert, and who can give us lines like—

"A flower flamed, a parrot screamed, night spread her peacock tail"

—well, what is one to say of her? That her mother writes the poems? Very well, hurrah for the mother! But the mother says she doesn't write them, that little Nathalia writes them, and it seems pretty clear that if the mother were the writer of the Nathalia poems, the very spirit which would enable her to write such lines would constitute her greatest inability to misrepresent them.

The difficulty with grown-up critics is that the world is far more wonderful than they ever imagined, and when a little of the wonder breaks through and becomes articulate, they learnedly doubt it. However, there are the poems, and that is the main thing.

## *Where Is He?*

WHERE is the gentleman who used to give the neighbors the horrors by figuring out how soon the raw material of the world would be exhausted? The last time we heard of him, the timber of the world was almost gone! Coal was very soon to follow it in disappearance. Oil was to vanish. Fishing was to cease because the fishes were few. Humanity had used up everything, and universal deprivation, need and suffering were swiftly to ensue.

The gentleman of the grim prognostications did well to vanish, for all his prophecies have failed, even before the set time. The coal of the world is a drug on the market and is becoming less necessary than ever before; it is actually being set aside by water and oil. The oil of the world is just being tapped, and the promise is that it too may give way in time to agriculturally produced engine fuel. Fishing has been practically recreated by the newer methods. As to lumber, it is being subordinated to substitutes on every hand, metal, cement, composition. The only thing left for the prophets of gloom to work on is the cooling of the sun (a former famous honor) which is now becoming less and less even as a speculation.

Wealth unbounded awaited mankind's awakening to realization of its work on earth, and material for more wealth than ever nature stored awaits his patient manipulation of the elements out of which the raw material is made. There is no poverty except in man himself, and that is almost instantly curable by the enlistment of his intelligence in coöperation with nature.

## *Good Signs*

ONE of the most hopeful signs for the new time in Europe is the number of young men of all nations who are coming to America, with their sleeves up, to learn. They have a clear view of three things:

That industry must get clear of finance—such as finance is in Europe;

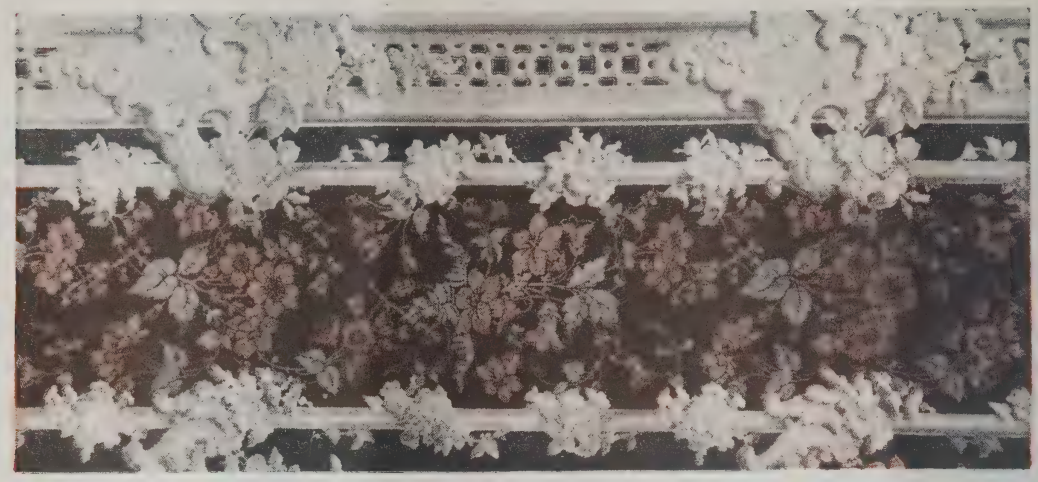
That industrial leaders must get away from the "office attitude" and even the corporation attitude and start their works from the ground up, no one being permitted to exceed the head of the business himself in the knowledge of every mechanical detail;

That there must be an economic union of Europe, for the abolition of customs frontiers, and any two nations making the start would become leaders of the New Europe.

Such is the rebound of the American industrial idea in Europe. True, there are still multitudes of European industrialists who cannot see these principles. Nothing is commoner than to hear the older men saying, "Oh, but you couldn't do that in Germany!" Yet, there are younger men who say, "But that is what we must do in Germany"—or elsewhere—"if we are to get ahead." The name Germany is used here because perhaps more of the "can't do it" is heard from that than from any other country.

The caste system of England, Germany and other countries has been appallingly strong. India had nothing "on" Germany and England for caste. That is being broken down, as it should be in any nation which is a racial unity. Nothing is more reprehensible anywhere than the oppression of one's own race, one's own kin, one's own countrymen.

## *Two Men Who Cannot Help*



MR. WIGGAM says that in the present world crisis there are two types of men who cannot help very much.

One is the Optimist who believes that you can take a Sow's ear and make it into a silk purse by deep breathing.

The other type is the Pessimist, who, confronted with a choice of two evils, takes them both.

Of the two, however, the Pessimist is not without advantage. He walks cautiously at least, and with his eyes open. He at least asks questions. He may be a Pessimist but he is an inquiring Pessimist. An inquiring mind is a safer mind to follow than a mind that accepts everything, with a gulp and a smile.

The surprises and disappointments in store for the Optimist are usually very sad. But the surprises and disappointments of the Pessimist are always good and glad.

# Colorful Wall Papers of Olden Days

By MARY HARROD NORTHEND

HOW suggestive of the period when the Colonial dames trod the stately minuet or pirouetted through the Roger de Coverly are the scenic wall papers of yesterday. In imagination one listens for the rustle of the brocaded gowns and views the powdered hair and patches, as the fair dame courtesies to her partner in the spacious drawing room of the late seventeenth or early eighteenth century homes.

There is no phase of interior decorating that appeals more vividly or romantically than do these quaint relics of the past. Unfortunately they are fast fading away through deterioration, but many retain their pristine beauty. Perchance the consistent setting of the charming old-fashioned room may enhance their artistic value; the white wainscot, such an effective background for the choice mahogany furniture, stiff-backed to be sure, but in perfect sympathy with the surroundings.

Fashions pass, the pendulum swings backward carrying us away from plain panelled walls into the world of wall paper, causing the pictorial designs that were in evidence in great-grandmother's Colonial living room to reappear in the decorating of today. While many of these are genuine, others are but reproductions of the old-time art, the former far exceeding the reproductions in color value, as many of the latter are totally unlike the original, both in tone and character.

In 1765 Benjamin Franklin wrote to his wife in regard to a room he had just papered, "that the paper of the room had lost much of its bloom by being pasted up." We are sure that he was color-blind, for on her return she found he had used "several divers papers on the same wall."

There are, however, charming examples that have been copied from old-time blocks that are almost, if not quite, equal to the originals. The best examples now in existence date back to quarter of a century before the Revolution and cover a period of about seventy-five years.

These include pastoral representations where are painted high holiday tones of vivid green, long lengths of sunshine, falling athwart beds of flowers; there are graceful maidens coyly flashing ardent glances that pierce the lover's heart, artificial lakes where islands clothed in misty green disport themselves. Tall oaks and lofty elms unmatched in height, while white moons float in an azure sky. These are but a few of the many that have been indelibly stamped on my mind and which loom up at me so vividly from the past.

In imagination I am seated in a high-back chair which had been brought over by my emigrant ancestor. It was placed by the side of the fireplace with its McIntyre mantel. A cherry wood fire burned on the hearth in great-grandmother's parlor and I sit dreamingly watching the dancing flame while I listen to the story oft-repeated, concerning the pictorial paper that is hung upon the wall. It was brought home about 1800 by great-grandfather who was a merchant prince in my native town, to hang on the drawing room of the large square house to which he was

Left—Wall paper at Mount Vernon, home of President Washington.

Right—Modern Chinese treatment.

to bring his bride. Great care has been taken of this paper and its color scheme is as bright as when it was placed there more than a hundred years ago. It was a Venetian scene with a gray background, the figures in black and the water a soft shade of blue.

These old pictorial papers are now being eagerly sought after, for there are only a few that have never been used. The late war has seriously crippled the output of reproductions. To be sure the Paul Revere, done in soft grays, is still to be purchased, but the many-colored pictorial ones are rarely found in the market. Occasionally we come cross one which often brings as high as fifteen hundred dollars. The blocks for their making are still in existence, sometimes two thousand being necessary to complete a single pattern, but the workmen are not to be had who are capable of finishing them.

Eighteenth-century designs were drawn by famous artists and it is these that embody the choicest traditions of their period. It is really lamentable when you realize that both the art collector and the historian have not preserved more than a few of the specimens.

So costly are they that in many instances they are mounted on cloth and stretched over wooden frames rather than being pasted on the wall; this insures their being rolled up and carried away should the house pass out of the family. The cost of papering a room with them can be estimated when one finds in an advertisement, "Twenty-four sheets of China paper with figure and gilt ornaments, at twenty-four livres a sheet." In American money this is equivalent to $4.80. Today they are much higher than this.

The origin of the first wall paper is not known but we are sure that when Columbus discovered America the walls of many Spanish houses were covered with squares of stamped and painted leather. Other European countries copied this fashion, but in England it is claimed that it has never been popular.

The first wall decoration that was used in England was tanned skins of animals; later experienced artists worked designs upon tapestry. They were made in comparatively narrow strips and worked like a curtain, up and down upon rollers. Their use was to shut out drafts and hide the unsightly ugly walls. At the present time "tapestry paper" means an attempt to reproduce the effect of cross-stitch done in silk or worsted upon appropriate material.

Above—Chinese wall paper. Larz Anderson's house at Brookline, Massachusetts. Left—The Hunt.

Painted canvas was used as a cheaper substitute for tapestry, as was dyed cloth. From the records of the past it is doubtful if paper hanging came into use in England before the sixteenth century, coming to them from Spain, Holland and the Far East. They were used sparsely, for the people are a conservative nation and do not take readily to new fashions.

The coverings were made in blocks instead of, as today, in long rolls, and the shading was done by hand requiring the utmost care. Charming tones of red, blue, and brown, produced quiet color effects, needing from fifteen to twenty sets of blocks for this purpose.

Holland was the first to establish wall paper factories and was followed by France and England. The designs were copied from Chinese tapestries or Indian cotton. Flock papers, imitating the old Florentine and Genoese cut velvets, were also made. This gave to the surface of the paper a velvety appearance, produced by first printing the design with a gummy substance, sprinkling it afterward with fine particles sheared from woolen clothes and dyed in various colors.

The middle of the eighteenth century saw noted artists interested in producing new and original ideas, their inspiration being taken from nature, literature, or mythology. By this means panoramic landscapes were wrought so large that some of them covered a whole room without a repeat. It required an enormous number of blocks for this purpose. Take, as an instance, the Cupid and Psyche paper composed of twelve separate panels.

# The Ideal Christmas Gift

THE measure of your gift is not its cost in dollars. It is the spirit of true friendship and the sentiment it conveys to the recipient that count.

That's why THE DEARBORN INDEPENDENT makes an ideal Christmas Gift. At small cost it enables you to express your friendship not merely at Christmas, but fifty-two times throughout the coming year.

For the folks back home, for brother, sister, or your dearest friends, THE DEARBORN INDEPENDENT will prove an acceptable token of your esteem.

An attractive gift card is mailed with each subscription.

*Christmas Gift subscriptions may be left with any authorized Ford dealer, or, if preferred, mailed direct to*
THE DEARBORN PUBLISHING CO.
*Dearborn, Michigan.*

This required no less than fifteen hundred blocks in its making.

One of the most popular subjects is Fenelon's version of the story of Telemachus which is shown in the old Knapp house at Newburyport. In color scheme it shows a background of clear peacock blue, scarlet and soft tones of green combined with black and white.

***Some Historic Scenes and Monuments***

We find this same paper on the Lindens, General Gage's headquarters at Danvers, Massachusetts. Though probably Directoire in type, it was not hung until some time in the sixties. There is an interesting story concerning this paper, for when the house was owned by Mr. Peabody, one of Salem's merchant princes, he came upon a wall paper factory in Europe where there was a complete sample set. Then he remembered in the old Forrester house, now used by the Salem Club, that during the time of his grandfather's régime, there was a similar one on the wall. For sentimental reasons he purchased and had sent home this paper which today is found in the upper hall of the mansion.

In the J. P. Lyman house at Ashby, Massachusetts, we find a most unusual paper. This is the "Paris Monument." It was imported in sections, each one of which was about eighteen inches wide, and thirty strips were required to cover the entire room. It is as fresh in coloring as when first placed on the wall early in the nineteenth century. There is no repeat in the subject which commences in front of the Invalid Hospital, a view being shown of the Bourbon Palace. We pass on beyond the Tuileries and the Triumphal Arch until we come upon Saint Stephen.

The historic "Pilgrimage to the Mosque of Omar" on the Bosporus, is the story of the wall paper in Lieutenant Parker Kemble's house in Marblehead. The house was built about 1743 and was lived in by Colonel William Raymond Lee, of Revolutionary fame.

Many of the reproductions of today are Chinese Chippendale in design, depicting groups of Oriental figures walking in a garden. They are delicately framed by fantastic trellises, from which are suspended urns filled with flowers and foliage. The colors are red, green, and brown upon black.

In direct contrast to the gorgeous Chinese Chippendale is a very interesting scenic paper that is shown in the Colonel Livingston mansion at Irvington-on-the-Hudson. It portrays Mary and her little lamb strolling through charming pathways where doves are hovering over them. Garlands of roses and branches of superb foliage together with exquisite scrolls and festoons inclose the scene, which is either gray upon a white background or old pastoral colors upon gray.

Hunting scenes imported from Antwerp were very popular. One of the best examples is in the Safford house at Salem, Massachusetts. Commencing with the huntsmen leaving the castle gate it follows the story of the chase until the capture of the brush. Scenes from Paris were much in vogue during Washington's administration as well as that of John Adams, for France was in high favor during that period.

Rarely is an American subject shown and yet at Portsmouth, New Hampshire, there is one of unusual interest, which was designed for a home in New Orleans. It was made in Paris in the early nineteenth century. All around the room there are shown in topographical sequence the Mississippi River, New Orleans, the National Arch in Virginia, Niagara Falls, and West Point. There are steamers plying up and down the river unloading their cargo at the pier, while groups of American Indians execute a war dance on a nearby bank. Over the fireplace we behold Niagara Falls, and dusky groups of African origin are scattered around the room.

A house built about the year 1820 by a sea captain has a very interesting paper, it having been brought home by the captain from one of his long voyages. It is printed from wooden blocks on rice paper in shades of gray and finished by hand. Although time has changed the color to a soft, yellow-brown of an old engraving, the designs are evidently the work of a European artist, but the rice paper and hand finishing stamp it as being a Chinese production.

Those who could not afford to import wall papers painted their walls in one color or they stenciled a simple pattern in imitation of French paper. Each one of these panels contained a picture, the chimney breast receiving special attention.

***Craftsmanship Was Perfect in Those Days***

In the old-time wall papers there was real meaning. They expressed distinct ideas, a single theme being often elaborated so as to decorate a whole room. This is particularly true of the Don Quixote which is shown in a Salem house, having been stored away in an attic for forty years before it was hung. This is one of the three choicest wall papers to be had in the country and the coloring is in tones of brown upon a creamy background.

In studying these relics of the past we are impressed by the fact that we have been unable even with the advance of science to improve or equal the tones. The methods were devised and perfected by craftsmen hundreds of years ago. Each color was printed separately and allowed to dry before proceeding with the next. This process gave it full depth and purity of tone.

It is the linking of the old scenic wall paper with that of the twentieth century that gives it intense interest and there is no more fascinating theme than to study the designs and compare them with the old-time tapestry and the reproductions of the present day.

# Did Shakespeare Mention a Contemporary?

Shakespeare before Lucy. (From an old etching.)

(*Concluded from page 2*)

MARY ARDEN'S SON

There are who claim that Mary Arden's son
Did not write Shakespeare's plays;
Too lowly bred.
Too grossly bred. Environed like a hind,
And fostered 'neath no academic shades.
So the wiseacres jabber, wag their beards,
And flout derisive his preposterous claim.
O solemn Dogberries! Colleges and courts
Are immemorial. Millions have they bred
In elegance and learning. Yet, august,
In solitary grandeur Avon stands
An inaccessible sublimity.
There is no peer to Mary Arden's son.
Oxford her gowns may teach to read and write,
But not to think—while the unlettered smock
Behind his plow, may muse like Socrates,
As in the earth the precious ore lies hid,
That pick and spade discover to the mint,
So in the infant mind the treasure lay,
Hutched in that beauteous brow by the same hand
That in the acorn stores the spreading oak;
And in the egg the blackbird's mellow flute;
And in the sun his inexhaustible beams.
When the predestined lad—a schoolboy's task—
The written word had mastered, his the crow
To pry his native treasury, his the spade
To dig the endowment of posterity,
The precious heritage of all mankind,
That affluent as Pactolus' yellow sands
Makes kings like beggars, beggars seem like kings,
Shakespeare gave forth what God in him had stored.

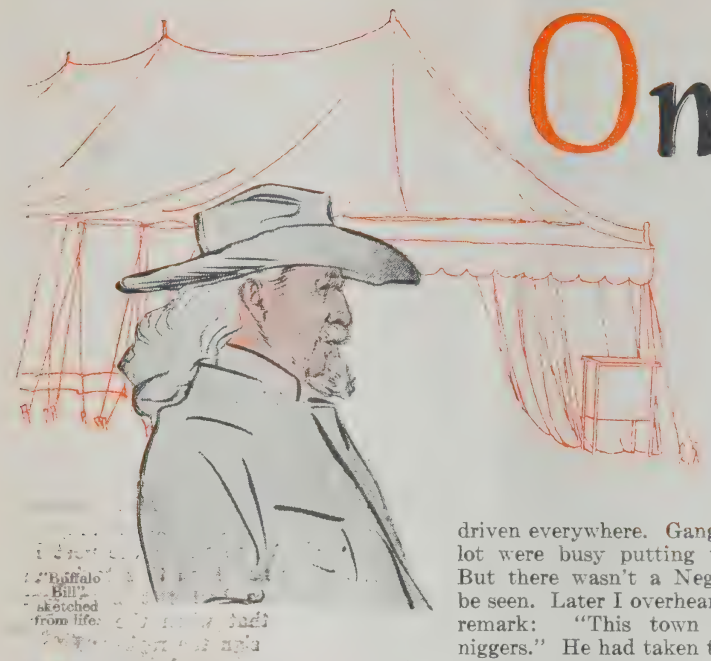
This pleased me so much that I wrote the following:

Ludlow, I thank thee for thy vivid lines,
That voice so well the Master's majesty,
Thy keen appreciation of the art,
That lifted him so far above his kind
That mortal never yet has followed him.
Thrice have I made respectful pilgrimage
To Shakespeare's Stratford, there to feast mine eyes
On sights and scenes familiar to his ken,
In buoyant youth and sober later years,
Here in the room where I indite these lines.
Above my head hangs Shakespeare's epitaph.
Rubbed from the stone that guarantees his rest,
While from a portrait opposite look out
The deep, impressive eyes of Edwin Booth,
Unequalled Hamlet of our modern day.
The actor vitalized the poet's lines,
But Shakespeare made great acting possible,
As oft he has before, as oft he shall.

I thank thee for thy tribute to his art,
The fruit alike of intellect and heart.

I sent these lines to John Ludlow, care of the New York *World*. In a few days I received an answer, but from another John Ludlow, who said that my letter had been forwarded to him, but that he was not the author of the poem and had never before heard of his namesake. If he ever should meet him he would tell him of my letter. And from that day to this I have never been able to reach my John Ludlow. I wish I could, for I consider his verse a gem and an example of true poetry.

Another item I learned in the Shakespeare house was that toward the end of his life he gave eight hundred pounds to a hospital and for that was entitled to sign himself William Shakespeare, gentleman.



When last I was in Stratford I saved till late in the afternoon my visit to the church in which the poet lies. As the day had been threatening and showery there had not been many visitors, so that when the attendant asked me to sign the register I found but two pages covered. Thinking that perhaps some Americans might be in town I looked over the names to see if there was anyone I knew. What was my surprise to find my own surname there in the signatures of Constance, Blanche and Maud Kilby of Leicester, England. I would have given much if I could have met them and talked genealogy.

I called the attendant's attention to the coincidence and he remarked that there were no Kilbys in Stratford, but there was a family by that name only seven miles away. And then I found that Shakespeare's daughter married a man named Quincy, for her second husband, which encourages me to claim that the bard and I belong to the same lodge.

# A Curious Literary Parallel

IN *Pygmalion*, Shaw has his character Higgins meet a flower girl in the streets. By a freak of fancy he decides to train the "guttersnipe" who has a "good ear and a quick tongue," and turn her into a society lady. After teaching her to enunciate, to walk in and out of a room gracefully, to play certain society games, to use certain phrases, and to speak with pedantic correctness of pronunciation and beauty of tone, Higgins introduces her into polite society. All goes well for a time, but the crash comes when the flower girl, at a crisis, relapses into the guttersnipe and drops into a specialized jargon which shocks her hearers.

In the eighty-seventh chapter of *Peregrine Pickle* Smollett has his hero meet a "foul-mouthed beggar girl." Like Shaw's Higgins, Peregrine Pickle holds that the conversation of polite society is neither more edifying nor entertaining than "that which is met with among the lower classes . . . that the only difference, in point of demeanor, is the form of an education, which the meanest capacity can acquire." Just as Shaw's Higgins takes Eliza to classical concerts, to lectures, to plays where she acquires all sorts of things, so Smollett's hero culls choice sentences from Shakespeare, Otway and Pope, and teaches his pupil "to repeat them with an emphasis and theatrical cadence." At last there is a society function and all goes very well until at a chance remark the veneer is cracked, when all the maxims of caution are flung aside and the girl opens "the floodgates of her own natural repartee." In both cases the transformed woman marries a subordinate character, and in both cases there is a kind of hidden moral to the effect, as Higgins puts it, that "the secret is not having good manners or bad manners, or any other particular sort of manners, but having the same manner for all human souls; in short behaving as if you were in Heaven, where . . . one soul is as good as another."

"Buffalo Bill", sketched from life.

# On the Road

## Colorful Pictures of Colonel Cody

By IRVING R. BACON—

IT WAS back in 1901 that I first met Colonel Cody. In 1905 I journeyed with him from Chicago to his home in the Big Horn Basin where they called him plain "Bill"; stopped at his splendid hotel Irma at Cody, Wyoming, and at his ranches, including "T. E." his favorite. We hunted and prospected together, taking pack trains and staying for days in the snowy mountains, whole counties away from railroads. Then again I was with him for weeks in New York City; but an experience that stands out as most interesting is a two weeks' trip with the Buffalo Bill's Wild West and Pawnee Bill's Far East show, through Illinois and Iowa.

For years I had longed to accompany Colonel Cody on the road with his tent show, and to experience circus life in all of its peculiar phases. The fascination of a life of wandering with a portable city, which the show really was, with its eight hundred persons, six hundred horses and other animals, its vehicles, engines and all the paraphernalia included in the peripatetic make-up of the aggregation, so played on my imagination that I wrote Colonel Cody for permission to join him. Very shortly came a telegram: "Come on at once. Major Lillie is away and you can have his stateroom."

I joined the show at Springfield, Illinois, early one morning. All was activity and noise. Stakes were being driven everywhere. Gangs all over the lot were busy putting up the tents. But there wasn't a Negro laborer to be seen. Later I overheard the Colonel remark: "This town is death on niggers." He had taken the precaution to seclude his colored help—an example of the foresight he constantly employed.

Grazing in the arena was the herd of bison, guarded by cowboys who would lasso a buffalo that wandered too far. Great wagons kept arriving; grooms were feeding and cleaning the animals; a few pet colts wandered around at will, snooping into everything, principally the oats; and the big string of burros tied around a wagon drowned out the noises of the camp with their braying. The roar of camels and the shrill trumpetings of elephants joined in the chorus of pandemonium.

The Indians began to arrive. Some carried suit cases. Somehow suit cases in the hands of blanketed, painted Indians hardly harmonized with one's previous notions of the noble red man, but there was some consolation in the fact that most of the receptacles were dilapidated and had sprung out of shape by excessive packing. The Indians were perfectly independent of the others; as soon as they selected a camp site they began to open their bundles; tepee poles were collected and soon an old-fashioned Sioux village arose on the scene. The labor of putting up the tepees, of course, fell upon the squaws. They went at the work with vigor and good-nature; they can put up tepees faster than we can tents.

The quarters of Colonel Cody were modest and yet afforded him as much comfort as is possible in roving camp life. The horse-broke man may imagine it a hard life, but the initiated will laugh at the idea. "Why," exclaimed Johnny Baker, "I'm old enough to be the father of most of these men around here. I've followed this life for thirty years; and to look at me you wouldn't think I have had hard life, would you now?"

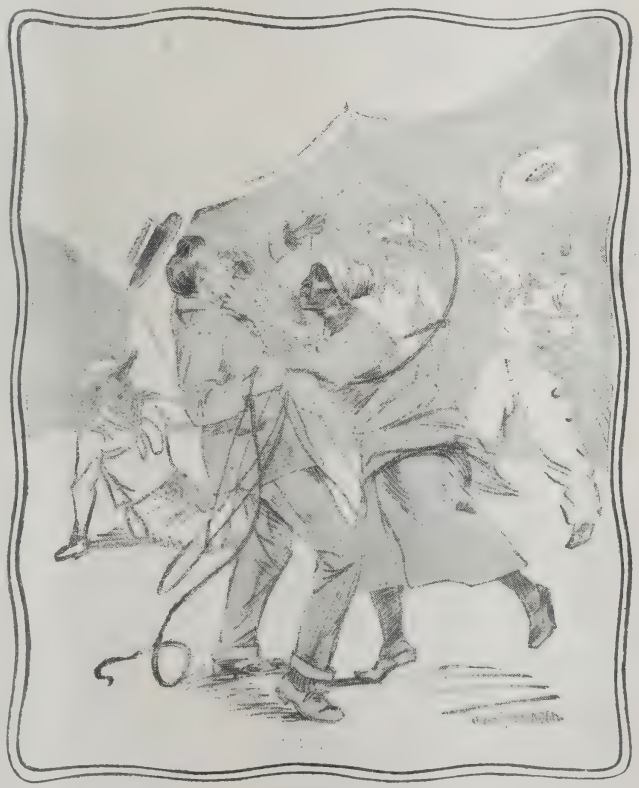
Colonel Cody's tent was about fifteen by twenty feet and covered by an extra fly which doubly protected him from storms and the hot sun. The heavy board floor was laid in sections and covered by a rug. A guard rope around the tent insured privacy, for if ever a man was pestered by inquisitive and officious individuals, he certainly was. The interior of the tent was arranged so that the front section served as an office and the rear as a dressing room. The Colonel's writing

"The big string of burrows tied around a wagon drowned out the noise of everything at times with their awful braying."

# with "Buffalo Bill"

## and His Wild West Show of Twenty Years Ago

ILLUSTRATED BY THE AUTHOR



"Suit cases in the hands of blanketed, painted Indians, hardly met the approval of one's esthetic notion."

desk was a purely utilitarian piece of furniture—a take-down affair—with four legs of gas pipe, a board and a box. Inside the box were pigeonholes and shelves. A swivel office chair, a few easy chairs and a sanitary couch completed the office furniture. The dressing room contained a commode and washstand, the Colonel's wardrobe trunks and another sanitary couch. On this the Colonel, when tired and opportunity permitted, reposed, covering himself with mosquito netting. Woe betide the person who disturbed him then; if an employe, he was liable to discharge; and if an outsider, he probably got a very unpleasant reception. The Colonel's tent was the last to be taken down at night and with its contents it completely filled the prairie schooner that carried it.

In one large tent were kept the splendid big draft horses; in the other, the riding stock. It was easy to recognize the different groups, such as the Indian ponies, bronchos, cavalry, artillery and high school horses. There were Shetland ponies, too, and at one end the camels and elephants. It was a wonderful sight to see those great creatures cleaned. They would lie down and roll over from side to side as directed, while the grooms clambered all over them—scrubbing them vigorously meanwhile with steel brushes.

The interior of the men's dressing tent presented the most animated scene of all. Here, barricaded off by their trunks, were sheltered the different types represented in the show. Near the entrance was a group of Japanese. They were dapper little fellows, and busy at writing, mending or embroidering. Nearby were the dark-skinned Mexicans. "Mexican Joe" was cleaning a Panama hat for someone, another was busy blacking shoes and Carlo was braiding a lariat. Adjoining them were the Singalese. They were all men, despite their skirts, their soulful dark eyes and hair done up in knots—woman fashion. Many of them had long silky mustaches. They were busy washing for the others; and kept to themselves, never mixing in the rough play sometimes going on. Not so

"She gouged into his neck and face with her long finger nails, yelling in the meantime, 'Me no lasso.'"

were the Russians. They went around attired in Cossack costumes, rough and uncouth in manner, and were regarded as below the social level of the other members of the tent. Next to them were the Armenian acrobats, all well dressed in civilian clothes. They were busy practicing tumbling feats—all powerfully built and conscious of their strength. Some were regular bullies and made themselves a nuisance with their loud, rough talk and conceited manners. Alongside them were quartered a large group of American young men, who performed the Zouave drills. It was made up principally of college boys or the like, taking in show-life for the novelty and experience.

Perhaps the most picturesque group was that of the American cowboys. As a whole, they were "broke," despite the fact that they drew big pay.

Many women were in the troupe; and with the exception of Lula Parr, the Champion Woman Broncho Buster, all of them were married, and most of them were accompanied by their husbands, who took active part in the show.

The Dahoman people lived apart in typical Arab tents. Like many of the other races represented, they spoke little English. They would resent any familiarity, and sometimes in a savage manner, too. One evening when several of the boys were practicing spinning ropes and throwing half-hitches, a stranger taking part in the sport was enticed to rope one of these women going by. In a burst of rage she faced him, fairly screaming: "Me no lasso." The culprit's first impulse was to run, but a cowboy yelled to him to hang on to his rope or he would never see it again. So hold on he did, to his sorrow. He expected nothing more than a wallop or two from the rope the woman was gathering, but instead, she gouged into his face and neck with her long finger nails, yelling in the meantime, "Me no lasso," while the cowboys rolled on the ground in glee at the green one's plight. Another day a Dahoman woman, while doing washing

for some of the troupe, doused a pail of suds over a gentleman who attempted to photograph her. Young Cody, the Colonel's grandson, who was up to all kinds of pranks, had the greatest respect for one of these women, for she one day chased him over the top of the stagecoach and all over the lot with blood in her eye. Cody's lasso thereafter degenerated into a clothesline.

The most interesting people in the show were the American Indians. They pitched their camp apart. The older men were reserved and so were the women; but the young men, most of whom spoke English, were a new race. Their ornaments approached millinery more than anything else, being much overdone. They played baseball and tustled with the help around, seeming thoroughly to enjoy the show life, and the admiring gaze of the public. The older men held aloof, and in their leisure time smoked and played cards. Old "Iron Tail," the chief of the band, was affable and accommodating when treated right, but I have seen him, when annoyed, assume the most savage attitude, his eyes glinting like those of a serpent until one could imagine him about to raise the scalp of the offender. He took part in the Custer Massacre, but what he witnessed, few whites have learned.

The squaws spent all of their spare time at bead work; and earned quite a tidy sum, for they had orders ahead for beaded belts, fobs, gauntlets, moccasins, and pocketbooks, toiling until dusk, and even then continuing in the glare of the powerful carbon lights.

By the time the first bugle call was given, the Indians were all generously smeared with paint. They galloped through the rain and mud like veritable old hostiles, bringing cheers of admiration from the audience, with their splendid lithe bodies turning off the rain as it is shed by the waterfowl.

In walking through the grounds, one would notice a man molding balls from hot pitch. They were the ones "Buffalo Bill" and Johnny Baker so dexterously smashed. Farther on, men were making vile-smelling discs resembling grindstones in shape and color. These were the carbons for lighting the show. The arsenal consisted of a covered wagon and tent. Here were guns and revolvers being cleaned and cartridges being loaded. A harness maker was busily plying his trade. Adjoining him was a blacksmith shop and forge in full blast. Several horses were being shod, the "onery" ones being thrown and tied down. And so it was with the entire show. It was a veritable city, boasting of a bank, post office, countinghouse, restaurants, and everything necessary for a thriving community.

In the forenoon the show grounds were open to the public and crowds of inquisitive visitors tried the patience of the guards. In big agricultural districts the farmers made the seeing of the show a holiday, and most of them were on the grounds early.

The show carried with it farmers of its own, too, in the shape of an elderly couple dressed as typical "mossbacks." It was their task to appear early in the morning on the city streets, driving a quiet old white horse in disreputable harness, hitched to an antique buggy. The old gentleman with steel-rimmed spectacles, chin whiskers, high-water pants, boots and straw hat was apparently much attached to his buxom wife, who also was togged up in old-fashioned country finery—bonnet, white stockings and all. Their progress was one continual comedy, for they pulled off all kinds of stunts on the crowded city streets, even going so far in their capers as to get arrested at times. Always at the climax of the dilemma, however, when the excitement was tensest, they contrived to extricate themselves and yell out that they would meet the crowd at the show later. At noon when they returned for luncheon, they had a fair estimate of what the gate receipts for the day would be from the number of people seen moving in the city.

The farmer visitors took great interest in the buffalo traveling with the show and inclosed in a heavily built pen; about thirty feet square and six feet high. Guard ropes all around and plenty of danger signs were not enough to keep the inquisitive back. They would even clamber on the fence and gaze on these animals, just as if they were kind-faced old cows. But the animals were quite savage. Sometimes they would bang into the fence head on, almost breaking it down and scattering the bystanders in terror. They could jump the fence, too; one of them did, running amuck and killing a horse.

As the crowd stood around one day at a respectful distance, due to the repeated warnings of the guard, a farmer in derision blustered out a yarn of how a friend of his had forty and milked them every day, just as others do cows. A cowboy, who was busy nearby, cleaning his saddle, drawled out: "I would sure like to buy some of that 'ere milk." This remark so offended the man that he worked himself into a rage, but all the satisfaction he could get was the same laconic remark: "I would sure like to buy some of that 'ere milk."

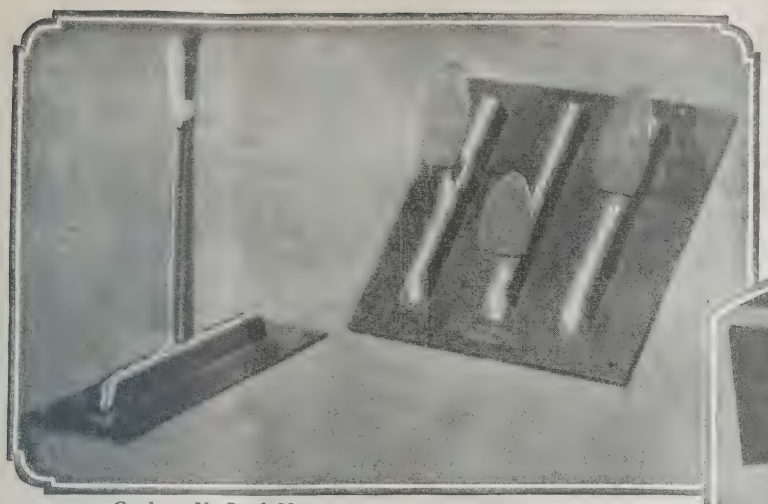
# How Your Instincts Have Disappeared

(*Concluded from page 7*)

same emphasis. The psychological section of the kite tail has not quite reached ground in England in this respect.

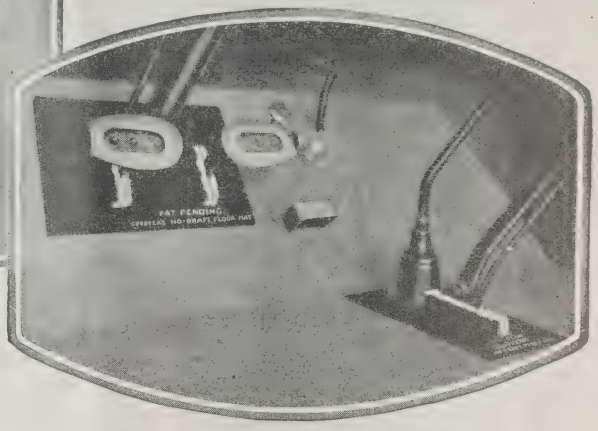
Pick up a recent American text on psychology, and note how little space is given to hunting, collecting, wandering, acquisition, and the like. They are not compatible with the laboratory, and only from that vantage point can a knowledge be built. Dr. John B. Watson states, "actual observation thus makes it impossible for us any longer to entertain the concept of instinct."

This has far-reaching significance. It is not an academic question of what shall and what shall not be put in college textbooks, but goes to the root of many social and political questions.



When grandfather's playfellow stole his jackknife, under the sway of an instinct psychology, informed persons would have said: "Too bad. The acquisitive instinct is unusually well developed in that lad." And that would have been the end of it, except for a possible whipping. On another day when he came home with a bruised nose it would be laid to the pugnacious instinct.

When your children are found with knives that are not theirs *there is no excuse for blaming it onto instinct.* It may be accidental, or it may represent a habit which has been or is being learned. You cannot train the female digger wasp out of paralyzing inchworms, but you can train a human out of the undersirable and into the desirable. It may not always be done, but is being done to an increasing extent weekly. Under the sway of an instinct psychology it would never have been done.



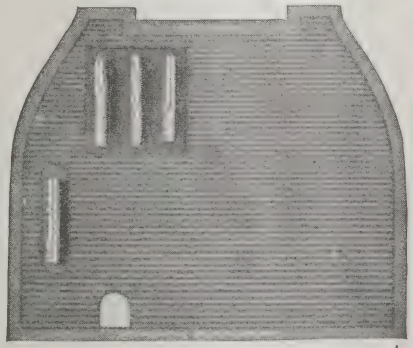
The cockroach has many instincts, and can be taught simple tricks which he will remember for not longer than half an hour. Instinct psychology would make us cockroaches. Some day it will come down to ground, as most of the American psychologists have, and find that the mark of the human being is capacity to learn rather than to exercise instincts. Psychologists can learn this, but not in armchair speculations. The laboratory may be less pleasant, but it is more necessary.

---

Russia has 50,000 women in public service, of whom 40,000 are members of local soviets. In high executive positions are the widow of Lenin (Krupskaya), chairman of the department of political education; Mrs. Trotsky, chairman of the committee for the preservation of art museums; Kollontal, ambassador to Norway; and Kamaneva, chairman of the federal bureau of cultural relations.

*Goodyear No-Draft Mats for all Ford Models*

*Goodyear No-Draft Mats for all Chevrolet Models*



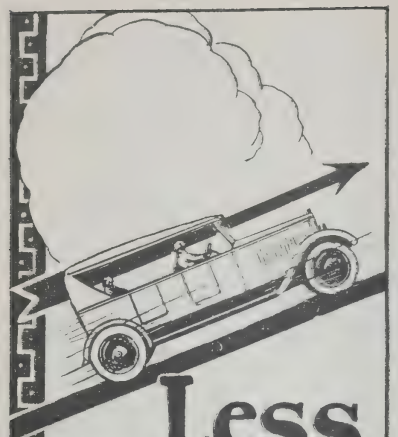
# *All-Weather Warmth and Comfort with Goodyear No-Draft Mats*

Why endure the chill, raw drafts that blow through the floor coverings of your car?—when in five minutes you can drive into your Ford or Chevrolet Dealer's and out again, equipped with the draft-proof, dust-tight Goodyear No-Draft Mat.

Designed to fit all open and closed models of both Ford and Chevrolet cars, the snug-fitting, raised rubber, wool-lined slots exclude dust, dirt, drafts and engine fumes.

* *

Note to Ford and Chevrolet Dealers: *Here is a timely selling item, a Goodyear product, and a genuine need at this season, from which many sales should result. Write for complete details to The Goodyear Tire & Rubber Company, Inc., Akron, Ohio, or Los Angeles, Calif.*



*This complete floor mat provides entire floor board covering plus the No-Draft features. There is a size for every Ford Model*

NO-DRAFT MATS

# Less Carbon

Heavy carbon content oils not only cause loss of power, but carbon not being a lubricant, contaminates the crank case mixture and on being forced with the oil between bearing surfaces, soon sets up friction.

Carbon deposits on pistons, valves and in the cylinder head of your motor are avoided when Humble Motor Oil is used. Humble Motor Oil has just the right body to properly lubricate all working parts of the motor, yet is light enough so that any part which is left on cylinder walls, piston heads or valves atomizes readily under explosion temperatures and burns cleanly. Most of the carbon in Humble Motor Oil is light and fluffy and is blown out through the exhaust, leaving little behind to foul the motor.

Make the Humble Chart Your Guide in Buying Oil.

HUMBLE OIL & REFINING CO.

HUMBLE OILS

HOUSTON, TEXAS

***The Man from Washington*** dropped into The Office and announced that if President Coolidge is spoiled, it will be the fault of the newspapers. "They thought they had to build him up to Presidential size," said he, "while the best thing they could have done for him and the country was to leave him as he was, simple and limited. He knew the value of his simplicity and also of his limitations. If he doesn't try to fill the picture the newspapers have made of him, well and good; but if he does, no telling what may happen."

"Any signs of his successor?" The Office asked.

"Well, you hear things now and then. But wanting to go to the White House and being wanted to go there are two very different things. The present occupant wants very much to stay. I wish he desired it less. I still feel that these matters ought to be left—partly, at least—to Providence. People who want the office too badly are not usually favored by Providence.

"We hear a lot about Hoover, but while he is regarded as possessing Presidential ability, it is doubted by his best friends that he would ever be a successful candidate. He doesn't know how. It isn't in him. He seems to be going ahead on pretty revolutionary government programs, and apparently with the President's acquiescence. But what that acquiescence signifies, is doubtful. Sometimes it means the President's approval. Sometimes it means the President's strong disinclination for a fight. In this instance, however, I think it partly means approval. Hoover would certainly not stay in the Cabinet and be a do-nothing. Whether any other Cabinet member would ever be permitted to do as much, is a question. President Coolidge probably figures that it is better politics to keep Mr. Hoover busy inside the Cabinet than to have him busy as a prospective Presidential candidate outside the Cabinet. I meet quite a number of persons in Washington who seem to hold that point of view.

"One thing is certain, whatever the heart-twitchings when the Presidency is mentioned, there is no overwhelming candidate in sight. I doubt if even Mr. Coolidge is the overwhelming candidate he was last time."

★ **This issue will stand out among magazines. You will want to preserve your copy.**

## Out Next Week

***The Man from Italy*** came into The Office and talked about conditions in his country. He says that Fascism, which at its beginning seemed to be the strong hand which Italy needed, has now degenerated into a reign of terror. There is no free speech, no free press. The doctrine that might knows no moral obligations is found stated at length in Mussolini's speeches. The result, he says, is that Italians, the basic, thinking, loyal, responsible class of Italians, are silent, and the only active party against Fascism is the Communists. This is the irony of the thing, he says: Fascism came in to destroy communism; instead it has suppressed Italian sentiment in toto, leaving only communism with zeal enough to oppose it. If Mussolini, said our friend, would make speech free, remove the press gag, and cease to threaten the very lives of citizens for utterance of honest opinion, his rule would not stand three days. Italy, he insists, has elements of national and industrial strength. The younger men see things from the American point of view. They are all won to the Ford doctrine of higher wages and greater production. They are also won to the view that customs frontiers ought largely to be abolished in Europe. "Free trade for Europe within Europe," he says. He thinks the beginning will come in an arrangement between France and Italy to abolish trade barriers. It was not so much what he said, as the feelings that actuated him, which gave me such a sense of hopefulness. The younger generation of Europe is *seeing* the truth, is feeling the injustice of the workers' situation in that continent. It promises well. Industry, instead of politics, is occupying increasingly more of the younger generation's attention as the means of national recovery.

# How Customers Impose on the Merchants

By EDWARD J. BECK

ILLUSTRATED BY WILLIAM H. FREYSE

DURING the exceptionally hot weeks of last summer, one of the large shoe stores in Detroit found that, contrary to expectations, the number of women entering the store to be waited on was increasing. Sultry and rainy days are usually times of inactivity, but in this instance more women came in to shop than on the temperate days.

But these women did not buy. The harassed clerk often took down a dozen pairs of shoes for a customer and frequently none of them were found satisfactory. Sales fell off, as they usually did at this season, but the clerks were kept busy showing merchandise to these feminine prospects.

One merchant called the attention of a fellow shoe dealer to this condition, and when the shoe men generally compared notes as they met each other, it developed that during the blistering days the same state of affairs was being repeated more or less in all the downtown stores.

A woman entered a store, seated herself with a sigh of relief and had her shoe removed. She wasn't sure exactly what she wanted; she was interested in the latest styles and wondered "what are they wearing now?" While the clerk was taking down some boxes, the customer removed the other shoe. First, there was some difficulty about size; then there seemed to be no style that suited exactly and finally she looked at her watch and said she had to hurry away to keep an appointment. She would come back later.

Here is the explanation that was finally found for this behavior. These women had come in not to inspect merchandise or to buy, but to rest their feet. They had come downtown in tight-fitting shoes, and walking on the hot pavements had swelled their feet to a painful degree. So they took a recess from their shopping and went into the only available place where they could get a temporary relief from their acute discomfort.

A woman with a belligerent mien went into a jewelry store with a bundle and asked where the adjustment department was. She was directed to the third floor.

"I have a set of silverware here which I bought some time ago. It is unsatisfactory. I want my money back," she demanded of the girl in the "return" department.

"Have you your sales slip?"

"No."

"How much did you pay for the set?" The woman mentioned a figure. "I've only had the set a short time and it's not what I want." As a matter of fact, she had had the set three months.

One of the well-known principles of this store is that "the customer is always right." The woman wasn't given a chance to squabble or argue, but was given the amount she asked without further questioning. She took the money and went to the elevator.

A sale of silverware was going on downstairs on the main floor. A 25 per cent reduction on all merchandise had been advertised. The woman went over to the silverware counter and bought another set exactly like the one she had just returned a few minutes before. She made a profit of 25 per cent and thus completed successfully what she considered a neat stroke of business.

The average American has a strong sense of fair play; he expects and gives a square deal. He is a reasonable fellow with whom to do business. But every large store has a minority of customers who take advantage of the merchant in many ways. The irascible customer is one of the pests who make the life of the clerk miserable. He illogically demands preferential treatment and is likely to explode in an abusive display of ill temper on slight pretext.

But certain impositions of the unreasonable and dishonest customer do more than detract from the general joy of life. They increase the cost of doing business and thus add to the prices the rest of us must pay for what we buy.

Take the matter of returned merchandise. One manager told me that 20 per cent of the goods sold in his place were later returned for credit. Another department store official who has studied the situation in a dozen different large cities estimated the percentage to be between 15 and 20 per cent.

"That's conservative," he said. "We had one customer who bought $300 worth of merchandise last month, but her net bill was only $24. She is an extreme and exceptional example of the abuse of credit and the return privilege."

"How do you prevent this sort of abuse?" I asked.

"In this store we have no set rule; our first consideration is to retain the good will of our customer, but some of the most modern stores require that the net bill shall be equal to at least 50 per cent of the gross bill. Another store I know about will not withdraw

"These women come in not to inspect merchandise or to buy, but to rest their feet."

credit privileges unless the percentage of returns is 75 per cent of the total purchases."

The practice of promiscuously returning goods entails a needless expense which must be borne out of the general profits of the business. The cost of delivery, the extra clerical work and a double amount of bookkeeping increase the overhead cost of doing business to which all the customers must contribute.

Some customers who have accounts in several stores order the same sort of merchandise from each so that they can compare the goods in their own home. They keep only one article and send back the rest. The fact that they are inconveniencing the dealer and putting him to unnecessary expense does not seem to bear any weight with them.

Wealthy patrons are sometimes the worst offenders in this respect. One bookseller has a number of rich customers who give occasional week-end house parties at their country homes. They order a dozen of the latest volumes to be sent out on approval. A few days later ten of the books come back as "not wanted." Frequently half of them bear evidence of having been read clear through, but only two or three are paid for.

"I can't do anything about it," said the dealer, "because I don't dare antagonize such prominent people."

"One manager told me that twenty per cent of the goods sold in his place was later returned for credit."

"The tricky customer lacks originality," said another bookman. "He's just like the fellow in a strange hotel who on retiring puts his money in his shoe to prevent robbery. He thinks his stunt is original. If a robber did sneak in the first place he would look would be in the shoe.

"Some people bring in books and want their money back. They have what they think is a plausible story. A husband or uncle or somebody has presented them with a copy of the same identical work and so they have no further use for the book. Usually they have read the book through; that can easily be detected by the way the book opens and by the fact that the back of it is not quite at right angles with the cover. They think they have a new yarn to fool us, but it's old stuff. I hear it almost every day.

"Some otherwise honest persons seem to have a double code of morality when it comes to books. Books and watermelons in the patch seem to be on the exempt list of honesty. We lose a lot through stealing. Our technical department suffers the greatest losses; the sturdy mechanic sees a $5 work on motors or a similar subject, and he seems to feel because it's in his special field he is entitled to it free of charge.

"In our secondhand department, one of the biggest nuisances is the man who comes in and makes our place a daily reading room. We encourage reading, but the fellow I am talking about will hide the work that interests him by putting it in the wrong place so he can find it when he comes back again. Meanwhile we can't put our hands on the book should there be a call for it."

Another nuisance to the storekeeper is the woman who "shops around" without ever having any intention of buying. Her peculiar method of having a good time at no expense adds to the burdens of the merchant and causes delay for the bona fide customer who has to wait until the clerk is finished with her.

An explanation for this futile mercantile sight-seeing is that it flatters the vanity to be waited upon. Some persons have an abnormal craving for attention; they enjoy being served. The restaurant or hotel that has a liveried footman to open the door recognizes this human weakness and caters to it. The customer who compels a clerk to take down a large assortment of articles and to heed her slightest preferences thereby experiences the shallow emotions of a temporary supremacy. She has found a cheap way of gratifying her egotism.

One of the ways by which dishonest customers get credit is to establish an account at two good stores, where they promptly meet their bills. They can then go to any other place in town and give these firms as references. They are given a high rating by the latter and on this basis the new store extends a liberal credit to them. They buy as much as they can, at as many places as they can and then disappear.

I was talking about some of the ways by which customers impose on merchants with a woman executive, who is connected with the Retail Research Association, an organization backed by the twelve or fifteen leading department stores of the country. Their aim is to modernize merchandising methods by exchanging records of experience and to promote business by finding new and better ways of really serving the customer. At the time the woman was installing a new service department in one of the member stores in a large middle western city.

"What are you doing to prevent the petty impositions of the customer?" I asked her.

"Nothing," she replied. "We never question the justice of a customer's demand. We try to satisfy them no matter how unreasonable they may be."

"Of course, a lot of customers are unreasonable, but when we satisfy them they are our best advertisement."

"Then you have a 'heaping coals of fire' policy?"

"We're not quite so idealistic as all that. We never ask: 'Is the customer right or wrong?' Our only concern is: 'Is he satisfied?' We take back any merchandise for credit, even if it has been used, because we believe that any goods which the customer has in his home which he regrets buying do us more harm there than if we lost his purchase money by a refund."

"You certainly wouldn't take back a used toothbrush, would you?"

"Yes, we would, but as soon as the adjuster had given back the money, he'd throw it in the wastebasket right in front of the customer's eyes. We never make any remonstrances or ask any questions until the customer has his refund and then we may try to get more details about the cause of the dissatisfaction. We avoid even the appearance of hedging on our policy.

"A woman comes in and launches a loud and long tirade about a transaction. She says she'll never trade here again and calls us a lot of names. Our man listens patiently until she has all her grievances off her chest and then he asks: 'What do you want us to do about it?' And whatever she says, we'll do.

"Of course, a lot of customers are unreasonable. But when we satisfy them they are our best advertisement. If they send in a small sample of calico for matching and want us to get them 10 cents worth of it, we will if necessary put a $25-a-week shopper on a whole afternoon's shopping tour to find what she wants, provided we haven't it. A woman wrote in from a suburb and said she wanted some genuine cotton bolls for a cotton wedding anniversary. She said she knew we didn't have such things, but asked us to get them anyhow. We wrote to some Texas connections of ours and they finally found what the woman wanted, after scouring the whole city of Waco. We wrote the woman that she had set us to a difficult task, because cotton was out of season and the new harvest was some months ahead. And we told her in detail how we had gone about filling her request. I'll venture to say that every person at that party heard about our unusual efforts; we got advertising we could have procured in no other way because the story of those cotton bolls was interesting and worth telling.

"A woman telephoned in from a country town 40 miles out and said she had to attend a funeral that afternoon and had no black shoes good enough to wear. She gave the size and asked us to hurry some out. An utterly unreasonable request—but in 20 minutes we had a special messenger with the shoes in a taxi on the way to the station. He missed the train and then took an interurban, arriving just ahead of the required time.

"A doctor telephoned in on the fifth of July and said he was just going to perform an operation and had found that his electric fan had been stolen over the Fourth. He wanted another at once and was very particular about the make. We didn't have the make he insisted upon. Then he made the unreasonable request that we loan him one of ours until he could buy a duplicate of the stolen one. In 10 minutes we had a fan on the way by special messenger. Before the boy reached there, a colleague in a neighboring office came in with the doctor's fan. He had borrowed it."

The store at which this executive is working is one of the most profitable mercantile enterprises in the United States. The owners have built up their business on the theory that "the public is always right" and their attitude of Tolstoyan nonresistance to the unreasonable demands of the customer has apparently been a remunerative one. The same principle, I was told, governed the leading stores in Boston, Cleveland, New York, St. Louis, and other large cities.

But prices would come down to a certain extent if we who constitute the buying public would let our relations with the merchant be governed by the principles of fair play and the square deal. The cost of storekeeping would be reduced and the consumers as a whole would benefit.

## The Dogwood Tree

MR. ERNEST H. WILSON, assistant director of the Arnold Arboretum in Boston, has spent more than twenty years in search of data about plants. He has traveled at least one million miles through China, Japan, Korea, South Africa, Australia and India. His research has led to the discovery, in all, of approximately 2,000 trees, shrubs and perennial plants never before seen outside the Orient.

The journey in search of the Dove tree (commonly known as the dogwood) a plant whose preferred habitat is the open woodland, the shady hillside and the roadside thicket, was the beginning of a series of plant-hunting expeditions which upset all the calculations and predetermined ideas of horticulturists the world over.

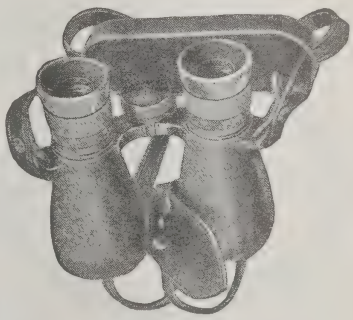
Not many days had been spent in China when Mr. Wilson suddenly discovered eleven Dove trees, at the height of their blooming season. Their existence had never been reported. He spent weeks waiting for the flowers to fall and the fruit to form. The production of seeds was enormous and they were sent back to England posthaste and planted. In time thousands of seedlings were pushing their way through the ground and in recent years they have flowered and have amazed crowds of people by their beauty.

It is claimed that the first Dove tree to flower on American soil is one in a garden at Newport, Rhode Island.

# What Better Gift?

A PAIR of genuine Rangeley Moccasins make a most pleasing and at the same time, practical gift.

There is a Rangeley for every member of the family and a style for every need—from high cut hunting boot to the comfortable indoor slipper.



What youngster wouldn't be pleased to find a pair of real Indian Moccasins in his stocking?

***I read in the papers*** that Scotland is finding that things are not going so well with her population. Of the entire population more than 45% or over two million persons live more than two in a room, which means that on the average at least five persons exist and sleep in a room and kitchen house. A recent report upon the slums of Falkirk indicated that the majority of the houses that were marked for replacement were built almost four hundred years ago. Scotland lost ten per cent of her population in a ten-year period before the war; there are 11 counties with less population than in 1921; 17 counties with less population than in 1850 and 5 with less population than in 1801. A qualified observer reports that if they were able to quit the country at least one-half of the artisans, miners and farm laborers would leave Scotland for Canada and the United States. Incidentally the troubles growing out of the refusal of Clydebank tenants to pay higher rentals did not originate with Scottish families, but others who had settled there by the government during war-time shipbuilding booms. The Scottish social situation is becoming still more complicated by the fact the South Irish are flocking in and the northern kingdom is taking on something of the aspect of the Green Isle.

***I read in the papers*** that neither the radio, the air mail nor the telephone have adversely affected the telegraph business. The leading telegraph company says that it is doing three times as much business as it was doing ten years ago. As for the air mail, the telegraph company says that a message by air mail often results in the reply being sent by telegraph, and radio communication still seems to be confined to messages to remote parts of the world, the heavy "trunk line" services between metropolitan centers is still done by wires overland and under the sea. At the same time the telegraph operators ascribe their ability to expedite their service as a principal reason for retaining a fortunate position. If an old thing is good, newer things do not supplant it.

***I read in the papers*** that commercial quarrying operations have begun upon the so-called Marble Mountain in the Big Bend region of Texas. This extreme western portion of Texas along the Rio Grande is sometimes referred to as the Alps of Texas and the unusual ancient mountains there teem with a mineral wealth that suggests the Canadian Laurentians. It is the principal American source of quicksilver and there are also deposits of copper, coal, zinc, sulphur, lead, silver, potash and clays. The Big Bend has another claim to distinction in that it is probably the last Wild West community in the United States. There are no railroads there and Mexican and American bandits combine to make the lot of the mining and ranching population as exciting as when "Billy the Kid" was alive. Texas is a big state but even so the sophisticated skyscrapers of Dallas loom up in startling contrast to the border outlawry of the Big Bend.

***I read in the papers*** that an organization has been formed in Indiana for the purpose of perpetuating the McGuffey readers. Half a century ago there were many small schoolhouses dotting Indiana's hillsides. The consolidated school was as then unknown. The lessons learned in these schoolhouses were the three R's, the readers prepared by Dr. W. H. McGuffey were the standard, and often the only texts. Many an old copy, its covers battered and leaves worn thin, went on the mantelpiece beside the Bible and the Almanac when new educational methods and subjects displaced the one-room rural school. The little red schoolhouse and the McGuffey readers became only symbols of an advance in the evolution of rural education. Now a public-spirited citizen from Bloomington has called a meeting of the "McGuffeyites" in Indianapolis, and an organization has been perfected and named whose purpose is to keep alive the traditions of the McGuffey readers and the little red schoolhouse days. The organization today has 200 members and publishes a monthly newspaper. It is a good thing that McGuffey methods and McGuffey precepts are being kept alive. There was far more wholesome logic and ethical instruction in these little books than there is in some of the encyclopedic volumes at present in use. Much wisdom was imbibed from the McGuffey font.

# Great Figures in Fiction

## (Sydney Carton)

### Perhaps No Novelist Has Conceived a Finer Character Than Dickens Has in the Hero of His *Tale of Two Cities*

By LEWIS WORTHINGTON SMITH

SELF-DEPRECIATION and recognition of his own shortcomings are the notes of Sydney Carton's character. He does not find his happiness in the assertion of himself in opposition to his fellows, whether by cleverness or intrigue or bravado. It is his pleasure to subject himself to his devotions, to give love rather than to exact its privileges, to spend himself for others rather than to insist upon their spending themselves for him. Fiction has its full share of gentle heroisms, but in the rôle of its great figures there is none at once more gentle and more heroic than Sydney Carton.

It is not until the close of *A Tale of Two Cities* that Carton fully reveals himself. It is when he is on the way to the guillotine in place of the man who has married the woman he loves that he becomes triumphantly what Dickens conceived him as being. The little seamstress going to her death with him for no reason of which she has any knowledge finds him a strength and a comfort in the last hard moments. They have between them the common bond of having ridden together in the tumbrel to the place of execution. In prison, too, she has known Charles Darnay, whom Carton is impersonating. Beyond that they are strangers who have been caught in the Revolutionary tumult and are the chance victims of its capricious furies. Out of the weakness and the unsteadiness of will by which he has seemed hitherto most to be distinguished, he has come to an unshaken resolution and a firmness of carriage in the very presence of death such as is the accompaniment of only the highest and purest bravery. So he serves as the dependence of the fainting heart and achieves a sublimity of self-sacrifice in laying down his life for his friend.

It is this spirit of self-sacrifice that places the novel in the nineteenth century. The time of the story itself is indeed earlier, but it represents Dickens and his way of thinking, as Barry Lyndon did not represent Thackeray. The satirist gives a realistic report of human qualities that flourished notably in an atmosphere not that of his own day. Dickens, on the other hand, lets us see the enthusiasm with which the humanitarianism that was the breath of his life had affected the world about him. Sydney Carton is a flame that has caught fire from the generous sentimentalism that emotionally was the glory of Victorian England and intellectually was its genius of betrayal. Dickens as the outstanding embodiment of that spirit is to be loved, but he is not to be trusted. He tells the truth about the expansion of the spiritual aspirations of his time. He does not arrive at the same certitude with regard to the actual doings of men.

The exaltation of self-sacrifice as a virtue and also as a means to happiness seems in the nineteenth century to have taken the place of the asceticism of the Middle Ages. It had at least the validity of a greater usefulness. It flourished in the concourse of men rather than in the cell of the monk. It was the spirit of self-denial socialized. Asceticism was abnegation self-centered. No priest is needed to tell his lay brother which is the finer and higher. Sydney Carton, waiting at the guillotine while the knitting women count one, two, three, four, and on, as the heads drop until it is time for him to place his neck under the ax, is perhaps the most notable figure that our fiction offers in illustration of that nineteenth-century passion.

Dickens was so individual that a great idealistic devotion might appear in him and be undiscoverable in any one of his contemporaries. He is, in this, however, not at all so alone. Individualistic as is Ibsen, not merely as a man, but as a thinker, he also plays somewhat upon the motive of self-sacrifice. In his interpretation of "Brand," Montrose J. Moses says, "He must always be ready to sacrifice." This is Ibsen's presentation of an intensely religious nature caught in a spiritual struggle of a sort characteristic of his day. In his later and more influential years Tolstoi made self-sacrifice the central item in his social and literary creed. He lived it and he expounded it with increasing fervor, and in the end he died by it. These two, Ibsen and Tolstoi, were among the few great outstanding literary creators and thinkers of the century. In the things that they thought they swayed the thinking of the world. They do not sway it so much now, but they are not of those who have passed into the number of the forgotten.

One reason for this lessening of the hold that they maintain on the allegiances of today is to be found in the weakening of our faith in the virtue of self-sacrifice. Even with such discrediting, Sydney Carton is himself imperishable. There may never again be such a tumultuous rush of violence as the French Revolution. There may never again be so mighty an urge to the exaltation of the spirit of self-immolation as was engendered by the titanic forces of that hour. There may never be a real Sydney Carton. The world has forsaken his ways. In actual ideals and aspirations it will hardly turn back, but in retrospective evaluation of what has been it will for long years follow Sydney Carton's tumbrel with admiring and loving wonder. At the same time it will have a beating heart for the coach that is carrying Charles Darnay and Lucie out of Paris on the dangerous road to security in England. Savior and saved are enshrined in that splendor of words by which those who have had no life in the flesh become human actualities and shape the thoughts and the deeds of men.

# Investigating the Air Investigations

(Concluded from page 4)

Headquarters. Officers were frequently detailed to investigate both the charges of the ground commanders and Colonel Mitchell, who was then Chief of the Air Service of the First Army.

Congress also took part in the investigation of the Air Service while the commanders of the American Expeditionary Force were organizing and training their men under high pressure for service on the firing line. The General Headquarters was continually besieged with Congressional visitors, and the first inquiry was as to the status of the Air Service.

The House committee on military affairs visited the American Expeditionary Force as an investigating body on the entire conduct of the war.

Secretary of War Baker conducted a personal inspection and investigation, paying particular attention to aviation.

Chairman Wadsworth of the Senate committee on military affairs started for Paris, but the Armistice was declared while he was at sea.

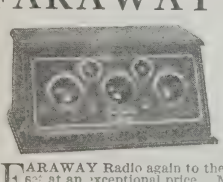
On November 11, 1918, the Armistice was signed and immediately General Pershing took steps to appoint the Dickman board with committees on every branch and activity of the Army. This committee was to make a study of the lessons of the war while the American Expeditionary Force was still in the field. This board was to recommend a general policy for the organization of future armies in time of peace and war. Aside from the regular commanders, a large number of temporary officers, who had made good overseas, were on the board. There was a committee on aviation and as this was a new service, great care was taken in the selection of the committee and in the preparation of its report.

The basic ideas recommended by the Dickman board were incorporated in the amended National Defense Act of 1920. Not only the General Staff which made the study on which the new military policy was based creating the Army of the United States took under consideration the Dickman report, but the military committees of the Senate and House gave great weight to it. In passing, it should be noted that both the Senate and House conducted an investigation of the air force when they were framing the new National Defense Act. Extended hearings were held by both committees on aviation, and the present status of the air force was fixed by the National Defense Act which is recognized as the first real military policy which this country ever had. It is in harmony with our traditions for a small regular army for training citizen soldiers that can be expanded into a large force without the attendant useless expenditure of money and loss of life that occurred at the beginning of the World War and every conflict into which this country has been drawn.

Congress and the Army thought that the new military policy would restore harmonious relations not only in the regular army but between the regular army and the national guard. This has been accomplished far beyond the anticipations of even the framers of the act, but another discordant element developed in the military situation which is led by Colonel Mitchell and has resulted in so many investigations.

Even before the Army left France, steps were taken in a group of Air Service officers to organize a movement for a united air service along the lines of the first Curry bill that appeared in the House. This provided for a Secretary of Aviation and a Department of Aviation as pretentious as the War Department with officers of equal rank and higher pay than Army or Navy officers. It was almost an exact duplication of the entire military establishment except that there was a larger percentage of officers than enlisted men, and would, therefore, be more expensive to maintain.

It was no secret in Army and Navy circles that there was a formidable organization of regular and temporary Navy officers behind the movement. It was reported to be heavily financed, as a large proportion of air service officers were men of means in private life.



I think it was in 1919 that Major Frank B. McKenna, U. S. A., Retired, who had a splendid record overseas in the Air Service, came to me with a description of the plans of this powerful group of Army and Navy officers. Major McKenna himself is far from being a poor man, and is now a successful oil operator in Oklahoma. He said that the organization was looking for a man to take charge of its publicity, and that on account of my knowledge of Army and Navy affairs he offered to recommend me if I would accept the place. He expressed the opinion that my salary would be at least $12,000 a year with a liberal expense account. In no way did he intimate to me that the aircraft manufacturers were interested in the movement, and I have never been able to connect them with it. All interested were patriotic men and their motives were above question.

Instead of accepting the offer, I attempted to persuade Major McKenna not to join in such a movement. I had been studying the whole problem during the consideration of the National Defense Act, and had quite an array of arguments which I thought proved that the proposal for a united air service was unsound and dangerous to the defenses of the country.

I have noted that a number of the Army and Navy officers, who he said were in the movement at the time, have separated themselves from it. The organization has apparently lost all of its Navy adherents and a large proportion of its Army supporters.

However, Major McKenna's prediction as to the campaign that would be conducted for a united air service has come true. The great multiplicity of investigations that have been brought about will be dealt with in the next article on the Air Service.

## What Is Patriotism?

THERE seems to be a false ring in the oft-reiterated statement that to resist British oppression, a nation leaped to arms. For if that is true, how shall we bring into harmony with it the fact that, in spite of eloquent appeals, in spite of the offering of bounties, in spite of gifts of land and the most lusty urging, there was all that sad starving at Valley Forge, and Washington had an army that numbered less than nine thousand? Nor does it seem that the patriot army ever numbered more than 25,000. Fifty thousand men was the force Congress expected, but that number was never obtained. By way of telltale straw accounting for the deplorable situation, we have the statement of Captain Graydon who says that he made a long journey as recruiting officer in Maryland and gained only one recruit.

But Washington had to fight against apathy in another direction, and there is sufficient evidence to show that, far from leaping to the aid of their defenders, the farmers sold their produce to the British in Philadelphia, leaving the patriot army to get along as best it might, while Washington was forced to raid the supply wagons en route to the enemy, or to send south to Virginia and the Carolinas for supplies.

What must excite admiration is not the cherished and false ideal of a patriot nation panting for liberty leaping lion-like, but rather the spectacle of a determined man assuming responsibility, and lashing the faint-hearted to continued effort.

# The Tax Muddle

(*Concluded from page 5*)

creasing. Released for taxation, the amount of revenue represented on a five per cent basis would amount to $850,000,000 per annum, just eight and one-half times the revenue received from the estate tax, the repeal of which is no longer debatable.

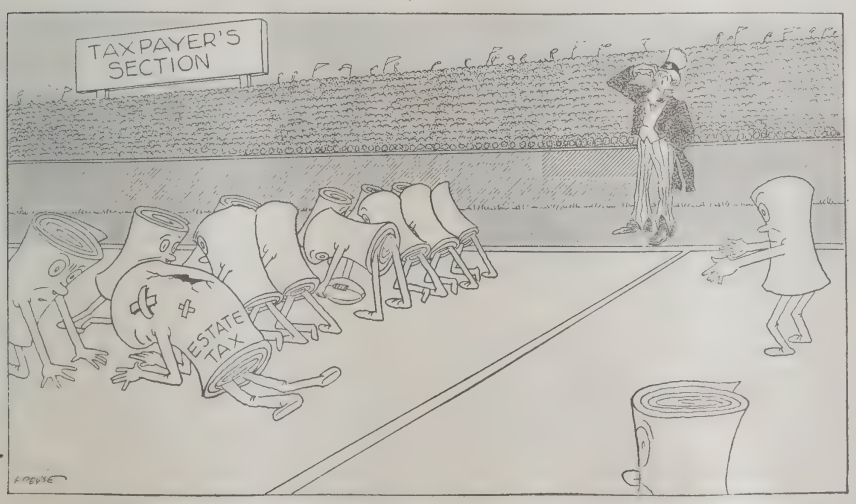
The United States Government has used the estate tax as a special war revenue producer after each of the great war periods—1797-1802; 1862-1870; 1896-1902 and 1917-1925, but in no instance has it been continued except as an emergency measure. In the exact words of the Secretary of the Treasury appearing before the Congressional Committee:

"Oftentimes destroying with one b'ow what has taken a generation to build up."

"It is the opinion of the Treasury that the estate tax should be repealed. The reasons for this position have been frequently stated but I can summarize them as follows: There is no logical basis for the Federal Government collecting this tax.

"The right of inheritance is controlled by the States and the Federal estate tax is based only upon the theory that to transmit property by death is the exercise of a privilege which can be made subject to taxation, just as we might levy a tax on the privilege of selling property. The present law, with its 40 per cent maximum, has not been before the Supreme Court, and the question has never been determined as to whether or not you can confiscate a large part of the property through a tax on the exercise of the privilege of transferring it. . . . .

"Estate taxes have always been a source of emergency revenue. It is only in war periods that the Federal Government has made use of them, and except in the present case they have always been repealed when the emergency ended. They should be saved for this purpose. We ought not to use our reserve in time of peace. We may need it badly when the next emergency arises. There is no emergency now. . . .



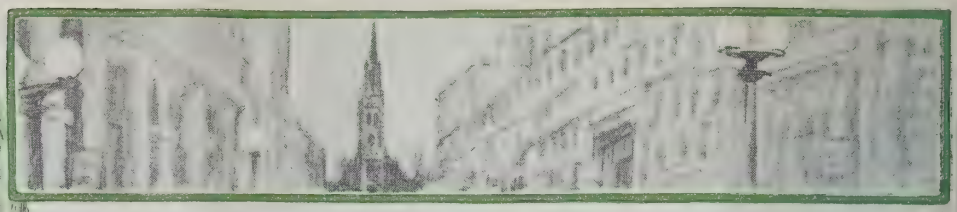
"The present muddle of death taxes in this country could in some cases take more than 100 per cent of what a man leaves. Excessive Federal taxes contribute largely to this muddle. The result must be that ultimately values are destroyed and with them the source from which the states must take revenue. . . ."

"The supreme danger to democracy," says Lecky, "lies in creating a state of things in which one class imposes upon another burdens which it is not asked to share, and impels the state into vast schemes of extravagance under the belief that the whole cost will be thrown upon others."

In New York State, we are told in the treatise by Gleason and Otis on Inheritance Taxation, "from one-third to one-half of all inheritance taxes are collected, and one-half of all litigation arising from the imposition of these taxes have been decided in her courts. In the last forty years the New York statutes have been codified or reënacted nine times since the first statute of June 30, 1885, and have been altered or amended no less than ninety-one times. She has taxed all personal property of collaterals and strangers, exempting only direct heirs." Moreover, in the fourth edition of this remarkable digest, just going to press, the operation of the gift tax will be thus described: "The gift tax is a new departure in Federal taxation, in truth there is little or no precedent for such a tax in any jurisdiction.

"It marks a further outreaching by the legislature to grasp at large fortunes and compel those who have acquired them to give large sums to organized charity or else let them go to the government. This is the undoubted trend of recent inheritance taxation. Such policy, if continued, must ultimately result in the ownership of a large share of the country's great industrial corporations by charitable and educational institutions. It will probably be changed, however, before any such calamity is permitted to accrue.

"The Federal theory is to assess the tax and leave the taxpayer to sue for a refund. This tends to oust the courts of their proper jurisdiction and place the burden of a contest upon the estate. It is vicious in principle, is an outgrowth of war conditions, but it makes matters so easy for the taxing officials and tends so effectively to increase revenue that the tendency to follow the Federal example is marked in the recent amendments to the state statutes."



"We ought not to use our reserve in time of peace. We may need it badly when the next emergency arises."

## Ugliness Unadorned

IN THE beautiful harbor of Sydney, Australia, there lies a rocky islet that forms the one ugly touch to the whole place, like an offensive mole on the face of a beautiful woman. It has a broken-down little dock at which small boats can land. Large boats give it a wide berth because of its rocky sides. It has a mud-colored, homely look and a crumbling building on its uneven top does not improve its appearance. It has a gruesome history as a prison spot where prisoners are said to have starved to death in olden days in cells down in the rock.

Visitors on ships from the north, who have seen the "Flower Pot" near the harbor of Pago Pago, in Samoa, wonder why this islet in Sydney Harbor is not covered over with enough earth to grow trees, flowering shrubs and vines so that it may be made into a similar gem of beauty.

# A Preacher on Business

## Maintains That a Monkey Wrench Has Been Misused

ONLY that which facilitates exchange can be called business. And whenever business gets away from this it brings in another definition which the dictionary gives of the word: "Disturbance, trouble, ado, fuss." And this is about all that business, both big and little, gets us into.

What's the matter then? It is the money we have, the way we use it and the way it uses us. If money were the medium of exchange that it should be, the ways of business would soon mend. But our institutions of learning from bottom to top give no common-sense teaching on political economy. The "dope" handed out on political economy starts in the common schools with *interest tables* and examples of *profit*. "Thrift" was talked to us all during the war, and it meant only saving money to put it in the bank. In my town now the children of the schools are getting talks from bankers of how to draw checks and make out drafts. Our oldest daughter in the high school has just given her opinion of a bank president's talk the other morning in chapel. Yet with this foundation the youth of the land pass into college and university where they are further enlightened in the "Dismal Science," otherwise known as political economy. It is no wonder that they know nothing whatsoever of the most important matter of the economies of social life. We are living in the Dark Ages as far as a real political economy is concerned.

This is Sunday afternoon, between sermons In a fit of desperation, or inspiration, if you would call it that, I felt moved to do this writing. And I am writing my conviction that business has been monkied with and a wrench has been thrown into the machinery. That wrench is *MONEY*.

I remarked, or wrote, above that money, far from the medium of exchange it should be, has been made something else—a *commodity*, a thing of barter and sale. This takes it out of its right place. And out of place it is not in hand when it is needed for exchange, being like a blotter which some one defined the other day as a thing we look for while the ink dries.

As a commodity money is not only worth more than it is as a medium of exchange, but in the money market it is so "fixed" that exchange is subordinate, and any careful student will agree with me it is no longer a medium of exchange. Money towers above all commodities, because it is *the* commodity. Thomas Chalmers evidently had something like this in mind when he said: "Commodities are *not* the terminating object of the trading capitalists; *money is the terminating object.*" It is legal, I know, but it is illegitimate. This misuse of money fastens itself like a parasite upon every form of natural resource and productive labor simply to end in a multiplied accumulation of itself.

This is why we find ourselves always changing our description of money as "cheap," "dear," "tight," or "easy," "elastic," or "inelastic." If we had long and short yardsticks, large and small peck measures, and divers weights in our bag, we could as easily do business with certainty and justice, as we can with money that can be so adjectively defined. "Corners" in any commodity work harm, but corners in money murderously outclass them all.

# Strange Cause of the "Turbio"

"TURBIO" is the native term applied to the phenomenon which recurs frequently off the coast of Venezuela. The arrival of the "turbio" is signalized by a darker coloring of the water and the disagreeable odor of hydrogen sulphide. Next follows a boiling and seething of the waters which appear to be full of bubbles. The water is literally packed with incredible thousands of fishes in schools over which gather flocks of sea birds, which on occasion have gathered in such numbers as to make it impossible to see the horizon and even to interfere with navigation. The fishes swim about as if desperate and run aground by the hundreds.

The phenomenon was at first attributed to some mysterious subterranean or volcanic source, one theory being advanced that the disturbance was due to some current from nearby sulphur deposits. But scientific investigation shows the real cause of the trouble is in the sea itself.

Old Mother Nature causes an overproduction of a minute single-celled form of animal life called Gonyaulax. Samples of water taken during the occurrence reveal that a single drop contains from 900 to 3,000 of the Gonyaulax in the densest part.

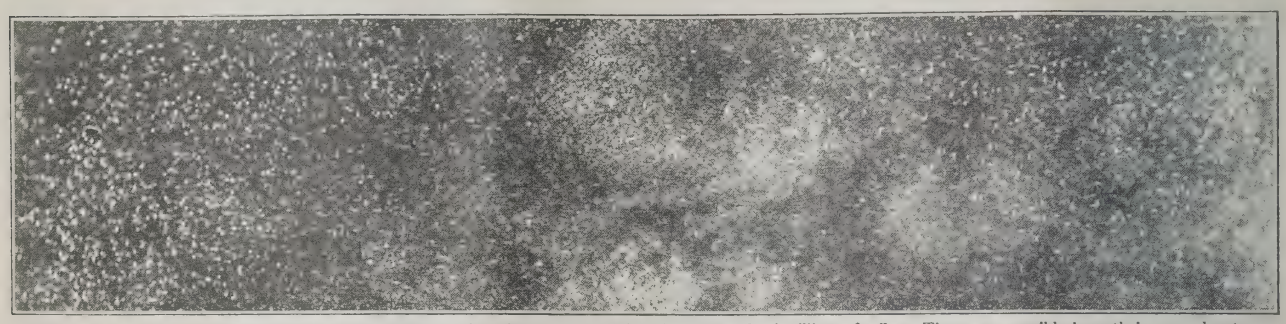
Although the coast of Venezuela is most noted for the "turbio," it is not confined to that region. One of the first published accounts of a "turbio" describes its occurrence at the Island of Hondo, Japan. Here the water became streaked and patched with a yellowish-brown hue following which came the usual conditions of turbid water, disagreeable smell and mortality among fishes. During this same year a similar occurrence was noticed on the California coast. A red streak first noticed in the water of the harbor gradually approached the shore accompanied by an unusual show of phosphorescence, given off by the animal itself. The crest of every wavelet was marked by a green-blue light, while in the more quiet waters of the harbor the fishes, crabs, et cetera, made trails of fire as they moved. The sulphurous odor was unusually strong and the fishes, as usual, darted madly toward the shore in a desperate effort to escape. Presently dead fishes and other forms of marine life began to wash up on the beach. For nearly 200 miles along the coast extending several miles to sea the water along the beaches was a brilliant vermilion. Dr. H. B. Torrey, who observed this particular "turbio," declares that the sulphurous smell and the death of fishes and other marine animals are caused by the death and putrefaction of countless millions of the minute Gonyaulax themselves.

# "Less Haste–More Speed"

To meet demand for the improved Ford cars, a new production record of over 8,000 daily was set recently.

This was not due to accelerated individual effort, but to the co-ordinated efficiency that characterizes Ford manufacture.

So tremendous an output has been possible because confusion, waste motion, and the carelessness that grows out of haste, have been eliminated in Ford production.



Accuracy of workmanship is essential in every operation. And to this, in large measure, must be credited the remarkably uniform performance of the millions of Ford cars in service.

The latest Ford Cars, which all Authorized Ford Dealers are displaying, are built with the care that has been rigidly enforced in Ford plants for many years.

FORD MOTOR COMPANY, DETROIT, MICH.

Ford

# Other Worlds Than Ours

Star cloud in which each speck represents a sun separated from its nearest neighbors by thousands of millions of miles. These suns possibly have their own planets circulating around them.

## Why Should We Worry About End of the World? Eminent Astronomer Says It Cannot Occur for Many Millions of Years

An Interview With
PROFESSOR F. R. MOULTON

By J. V. NASH

FROM the earliest times the star-spangled heavens have been a source of awe and wonder to mankind. With the unaided eyes, however, only a faint conception of the number of the stars and of their size, their distance, and their brilliancy is possible.

So it was that for ages our ancestors, knowing little of the real nature of the stars, looked upon them as mysterious objects which exerted a magic influence upon the affairs of human beings, and a class of men called astrologers grew up, who purported to read the fortunes of nations and of individuals in the movements of the planets, while the sun and moon were in many parts of the world accorded the honor of religious worship.

It was not until the invention of the telescope that the true science of astronomy was born, and when Galileo with his little glass detected the moons of Jupiter the epoch-making discoveries of the astronomers began.

Since Galileo's day the story of astronomy has been a record of brilliant progress constituting altogether perhaps the greatest of man's intellectual achievements.

In our own day astronomers have opened to our eyes new and larger views of the universe, revolutionizing our previous conceptions, and involving figures the stupendousness of which might well stagger the boldest imagination.

Among living astronomers, none has contributed more to this expansion of our knowledge of the heavens than Professor Forest Ray Moulton, of Chicago. Though his researches have already covered more than a quarter of a century, he is still in the prime of life and busily engaged in new investigations.

When, by a telephone appointment, I called at his office in one of the University of Chicago buildings the other day, I found seated at the desk an alert, well-groomed man whose appearance suggested the busy professional man, rather than the layman's mental picture of a savant in one of the most abstruse and recondite of the sciences.

To Professor Moulton, indeed, astronomy is anything but a dry and theoretical subject. He discusses his work with all the enthusiasm of a small boy in the country on the subject of fishing.

"I used to think, when a boy," he began reminiscently, with a twinkle in his eye, "that the days of adventure and discovery were over, and I felt sorry for it, as there seemed to be nothing left for the explorer to do. But later I found that Columbus never had such an adventure as a person gets when he explores in his mind the depths of the universe. Now I am glad that I didn't live any earlier, because of the marvelous riches that science has brought to us in our own day, which make life really worth living.

"With our powerful telescopes we sweep the heavens and millions of stars are revealed to us which the naked eye never sees. Many stars, indeed, are so distant that they can only be detected by long exposures of delicate photographic plates.

"There are uncounted myriads of stars, at least 500,000,000 of which are known to us. Every star, remember, is a sun. Generally speaking, every sun is comparable to our own in size, dimensions, temperature, the kind of light it radiates, and the like, though some of them are, of course, much larger, like the giant Betelgeuze, the diameter of which, as you may know, has recently been measured and found to be three hundred times larger than that of our sun.

"We have called the stars *fixed*, just as we used to speak of 'the eternal hills'; but only poets now speak of 'the eternal hills,' as we know that tomorrow, geologically speaking, they will disappear. So the stars are moving, but they are moving so slowly from our point of view that it takes a long time to detect the movement without the use of powerful telescopes. But we know from their distribution, from the forces operating on them, and from the underlying laws controlling them, that they are moving around among one another like bees in a swarm or people on State street on a busy afternoon."

Professor Moulton exhibited some photographs of star clusters, in which thousands of stars were visible, and packed so closely together that they seemed almost like a solid mass of fish roe. These stars, however, are so inconceivably distant that, as a matter of fact, each star is separated from its nearest neighbors by thousands of millions of miles, indeed by a distance 100,000 times greater than that which separates our sun from the earth, which is a distance of some 93,000,000 miles.

In addition, he explained, it is quite possible that these stars, being suns much like our own, have their planets circulating around them—dark bodies which at such a prodigious distance are far beyond the range of visibility.

While the total number of stars is, of course, unknown, since they stretch away into a filmy haze, even on the sensitive photographic plates, approximately 500,000,000 of them have been, as already indicated, identified by modern astronomy, although only about 5,000 are visible to the naked eye.

"If we watch these suns for only two hundred years," continued the astronomer, "we find that they seem to be moving in straight lines, but if we could watch them for 20,000 or perhaps 200,000 years, we should observe a curvature in their path. Our sun moves with respect to other stars about 400,000,000 miles a year. The average distance between adjacent suns is 300,000 times 100,000,000 miles. Many of these suns are so far away from our earth that it takes their light thousands of years to reach us, with the light

traveling at the rate of 186,000 miles a second.

"Our sun lies deep in a galaxy shaped like a lens or match. The galaxy of stars of which our sun is a member consists of at least a thousand million suns comparable to our own. About half of them are in most respects very much like our own sun, but some of them radiate thousands of times as much light and some of them are millions of times as great in volume.

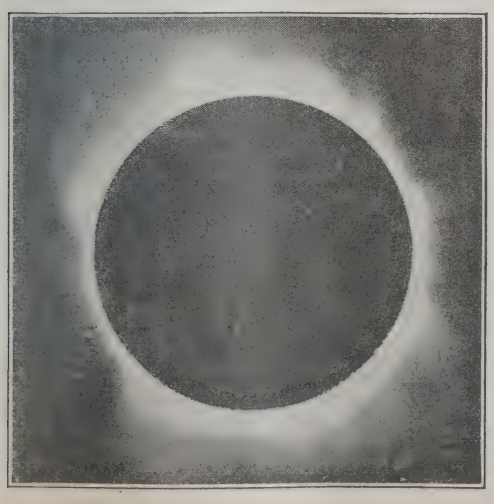
"The thickness of this galaxy is the distance that light travels in twenty or thirty thousand years. Its distance through, from edge to edge, is approximately ten times this distance, or that which light travels in two hundred or three hundred thousand years.

"Outside of our galaxy are other galaxies in enormous numbers. Only during the last year have we been able to measure the distance to them. We take photographs of objects which are so far away that light has been on its way to us millions of years and we see them as they were at that long-ago epoch. It doesn't seem unreasonable that these galaxies in great numbers together form a super-galaxy, just as myriads of stars together constitute our galaxy, and it is quite possible that many super-galaxies form a larger cosmic unit which may be called a super-galaxy of the second order. Even then we probably have not reached the limit, for super-galaxies of higher and higher orders may exist without end.

"One naturally recoils from these immense figures; it seems unreal because it is unfamiliar. But to those of us who are familiar with it and are mathematicians the difficulties are not serious. There are more difficulties in an atom than there are in these great galaxies. There is as much mystery in the radio. It is hard to conceive of the marvelous amplification by the audion of those feeble impulses that go through the ether."

Professor Moulton explained how, by means of spectrum analysis, the nature of the substances in the sun has been ascertained. "Every kind of substance in an incandescent state," he explained, "gives forth a certain kind of light. Iron, sodium, calcium, et cetera, each gives its own kind of light. If there is a certain character of light that travels twenty feet in the laboratory, it will be the same if it comes millions of miles from the sun. So from the character of the light that comes from the sun, as registered by the lines in the spectrum, we can determine what is in the sun. So we know there is iron and nickel and cobalt in the sun, and in fact most of the common elements."

"It is highly probable," states Professor Moulton, "that the earth will continue to revolve about the sun and be in a condition suitable for the abode of the higher forms of life for hundreds of millions of years. Its ultimate destruction, however, is likewise highly probable. When our sun passes again near another sun, the planets which revolve about it at present will probably be utterly destroyed and scattered along the arms of a new spiral nebula, to be swept up and become parts of a new generation of planets."



I next asked Dr. Moulton to explain something of the process by which solar systems such as our own are born. This question was of particular interest, because Dr. Moulton, in collaboration with the great geologist, Professor T. C. Chamberlin, is the author of the famous *Planetesimal Hypothesis* which is now so widely accepted both in this country and abroad, as the most reasonable explanation of the birth of our solar system.

Dr. Moulton, like other astronomers, had long been aware of the weaknesses of the old nebular hypothesis formulated by LaPlace as far back as 1796, and its inability to account for many facts, such, for instance, as the satellite system of Saturn. He first put forward the planetesimal hypothesis in 1900, and twenty-five years of subsequent investigation by himself and other scientists have increasingly confirmed its validity. In England it has been adopted and is known as the *tidal* theory.

In explaining this epoch-making hypothesis, he went on to say to me: "Our sun and its planets are, as I have already pointed out, members of a cosmic unit known as a galaxy, not an isolated group of bodies. About once in a period of *a thousand times a million times a million years* our sun will, on the average, approach near to another sun. Enormous tides will be formed and a certain amount of matter will be shot out, and in this way a spiral nebula will be developed. It will contain nuclei and vast quantities of scattered material. The nuclei in their circulation around the central sun will sweep up the scattered material and grow into planets.

"This is not a mere speculation. I spent several years in actual calculation to convince myself of its occurrence, and that it really occurred in the formation of our solar system is at least highly probable. Moreover, we have in the sky today all sorts of these spiral nebulae, which we can observe, tipped in every direction, from perfect flatwise to perfect edgewise." He brought out several photographs showing specimens of these interesting celestial formations.

"One such nucleus," he continued, "gradually grew into our present earth. The earth originally probably was too small to be able to hold an atmosphere or water on its surface. As it grew in size, by sweeping up the scattered material in its path, its gravitation increased and eventually it became surrounded by an atmosphere and largely covered with water. The process of

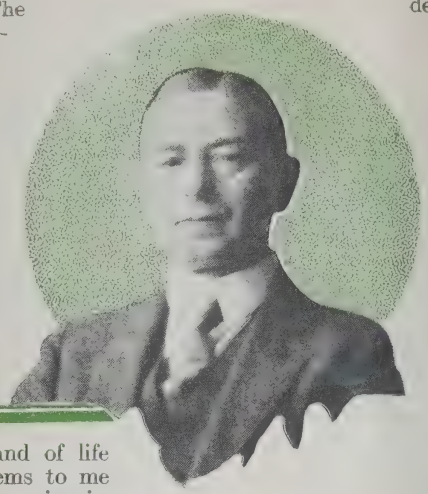
Left—Sun's corona extending outward for thousands of miles, displayed only at the time of a total eclipse. Spectrum analysis has indicated that most of the elements common to earth are present in the sun.

Right—The moon's craters and mountains, brought nearer to earth by a powerful telescope. Professor Moulton considers that life as we understand it would be impossible on this satellite.

*(Photographs used with this article from Yerkes Observatory.)*

growth produces circularity, and so those planets that have grown the most should have the most nearly circular orbits, and Jupiter and Saturn and the others do.

"The earth is still growing by the accretion of particles of matter. It is highly probable that in earlier times there were possibly thousands of pounds of meteoric matter falling every day on every square mile of the earth's surface."



My next question had to do with the probable date of the appearance of life on the planet. "Life did not begin," he responded, "until our earth had reached approximately its present size, and this was probably two billion—that is, two thousand million—years ago. It is likely that life began first on the seashore where the air and the soil and the water unite.

"The water dissolved from the rocks various elements such as sodium, potassium, calcium, iron, et cetera, and carried them in solution into the sea. On the seashore there was an infinite variety of concentration of these various elements. There was also the rhythmic succession of day and night, and the pulsing tides and the lapping waves, which gave a variety so great that it is impossible now to match it artificially.

"Somehow, in a manner unknown, the first steps in the great life sequence upon the earth were taken. Of course, the first forms of life were very low. The smallest microörganism which we have today may be comparatively high in the scale, containing at least 100,000,000 molecules. Most of the life history of the earth was past before the vertebrates came on.

"This, as I say, all happened at the minimum two billion years ago. It may have been much farther back. Records indicate it.

"During all of that period the sun has radiated light and heat upon the earth almost exactly at its present rate, and during all that time the earth has never been visited by any great cataclysm which destroyed all life."

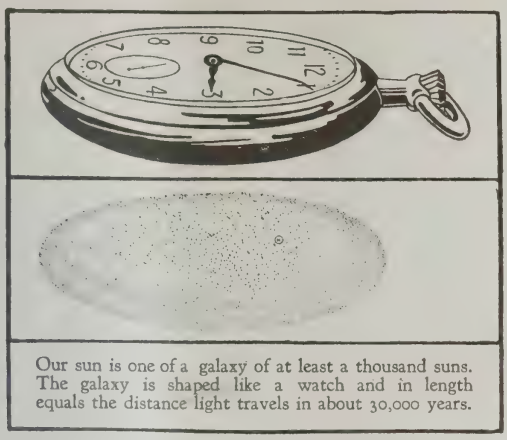
"The growth of worlds and of life through millions of years seems to me much more marvelous and awe-inspiring than a sudden creation a few thousand years ago," says Professor Moulton with reference to the spiritual significance of the new universe which astronomy is opening to view.

"The thing that impresses the astronomer most is not, however, the magnitude of the physical universe, nor its long duration, but the fact that it is perfectly orderly. Order is the foundation on which all science is built, and the orderliness of the universe in time, that is, its continuous and orderly change, is the essence of what is known as evolution."

He went on to assure me, however, that in case another sun did come dangerously close to the earth, it would take at least 100,000 years, after its approach first became visible, for it to reach a point which would bring about the cataclysm which he described. The inhabitants of the earth will therefore have plenty of time in which to make their wills and adjust their affairs. Nor is any such sun as yet even in sight.

"Besides," he concluded, "there is no immediate danger of this event, for the stars are so very far apart that the near approach of our sun to another sun will, as I have already stated, happen only about once in a period expressed by the figure 1 followed by fifteen ciphers."

While he did not deny the possibility of life on the planet, and perhaps of a very advanced order because of its greater age, Professor Moulton was somewhat skeptical about the reality of the so-called canals as artificial works of irrigation.



# Builds Ten-Room House Single-Handed

FASHIONED solely by his own hands, Samuel Siggins, of Fort Myer Heights, Virginia, has built a ten-room house within a period of seventeen years, utilizing his leisure hours. From foundation to roof it is the architecture of the builder. It represents at least 100,000 hours of labor. He conceived the idea of building a home from the utilization of spare hours in 1906, when he selected a site somewhat removed from the populated area around Fort Meyer Heights. In the same year, Mr. Siggins quarried the first stone for the foundation. Sand was obtained in the vicinity and conveyed to the site in a cart. Subsequently, every stone was placed and each nail penetrating the building driven by the hands of this master craftsman. The tile roof in placement is a result of his handiwork.

and even the plumbing system was installed in the absence of assistance.

As a builder of carriages, Samuel Siggins receives a compensation of seventy-five cents an hour, which rate, if he labored 100,000 hours on the dwelling, makes an investment exceeding $75,000. This artisan, however, counts his product a "labor of love" and wonders about how he will utilize his leisure hours when the finishing touches are added. Ten rooms and two baths constitute the attractive house, and the creator will move into this product of "his affection, hope, and pride," when completed.

Our sun is one of a galaxy of at least a thousand suns. The galaxy is shaped like a watch and in length equals the distance light travels in about 30,000 years.

# Other Worlds Than Ours

Amazing astronomers' pictures illustrating the article on pages 31—32 of this issue.

Spiral nebula which telescopes disclose in Ursa Major.

The Great Andromeda Nebula, the nearest galaxy of stars to be photographed, found to be distant about 1,000,000 light years.

THE LIBRARY OF THE
UNIV OF ILLINOIS
URBANA ILL

BLESSED is he who has found his work; let him ask no other blessedness; he has a life purpose. Labor is force, breathed into him by Almighty God, awakening him to all nobleness, to all knowledge. Hast thou valued patience, courage, openness to light, or readiness to own thy mistakes? In wrestling with the dim brute powers of fact thou wilt continually learn. For every noble work the possibilities are diffused immensity, undiscoverable, except in faith.

CHRONICLER OF THE NEGLECTED TRUTH

## THE FIRST SNOWFALL

The snow had begun in the gloaming,
And busily all the night
Had been heaping field and highway
With a silence deep and white.

Every pine and fir and hemlock
Wore ermine too dear for an earl,
And the poorest twig on the elm-tree
Was edged inch-deep with pearl.

*—James Russell Lowell.*

The DEARBORN INDEPENDENT

# The Essence of This Issue.

*Merry, Merry Christmas everywhere,*
*Cheerily it breatheth through the air."*

Draw up your chairs round the fire and have a look through our Christmas Number. It may be a little early, but we believe in Christmas beginning early and lasting late. Our writers and artists have caught the spirit of Christmas, past and present, and have recreated the atmosphere of the kind and charitable season. Surely it was a great gift of the Christ Child to humanity in our wintry climes, when such a glow was lighted at the heart of winter by Cheery Christmastide. "Merry, Merry Christmas—Everywhere!"

---

In this number Mr. Ford has something to say about growing a folly-proof race.

---

Dickens is the Master of Old Christmas scenes. More than any other, he knew just how to lemon and spice the wassail, how many plums go in the pudding, what part of sage and sweet herbs make perfect the turkey dressing, how the sirloin should be roasted and mince pies flavored. "The Seven Poor Travellers" take us to a quaint old town to dine with six companions who like himself seek sympathy and the warmth of a Christmas fire. Who the poor travellers were and what befell at their feast, makes one of Dickens' inimitable pictures of human hearts under the Christmas spell. (p. 4)

---

But the original and classic Christmas story was written by a beloved physician, one Luke, in whose Memoir of Jesus it appears. Luke made inquiry in Palestine into these matters, and wrote down his findings. In the story, as he tells it, scholars note a curious change of tone. Luke, as a writer, had a grand, distinctive tone—but when he comes to the story of the birth of Jesus, the style changes—it is like a woman's voice breaking into the narrative. It may have been Mary the Mother of Jesus telling these things to Dr. Luke. Being a modest woman, she would hesitate to tell them to a rough man like Peter or a young man like John. To this physician she could confide her story. (p. 8)

---

Christmas memories of those thrifty, hardy, peaceful pioneers, the Pennsylvania Dutch, are told by one whose "first Christmas away from home" was spent among them. May all folk away from home at Christmas find good Dutch friendship. (p. 15)

---

Are people better and happier now than they were fifty years ago? Philip E. King, in half a century of reminiscence, tries to settle the matter. (p. 18)

---

Did you ever spend Christmas on the farm? Did you ever see the rooster with his frozen comb, and icicles hanging from the eaves, the frozen pump, the snow-covered woodpile? Did you ever hear the crisp, frosty song of the sleighs and the jingle of the bells? If you have, then you will know that Homer Croy has written here a true record. (p. 25)

---

Carol singing has by no means died out, the waits still go their rounds "upon the midnight clear." There has been a renewal of the pleasant ancient custom. One who has spent more than one Christmas in England tells us all about this. (p. 28)

---

Even Christmas may be tinged with regret. Parents sit at home thinking about their children. An American father is doing that in this number. He thought that he would have his family all about him, but it has not turned out that way. In realizing their own dreams they have broken their father's dream. (p. 2)

---

The story of old American bottles is told by Mary Harrod Northend. (p. 12)

---

Horace Windham gives us a survey of Christmas customs in many lands. It shows how, after all, the human family is bound together by the remembrance of Bethelehem 2,000 years ago. (p. 30)

# What Happened to a Dream

## Showing How a Clash of Ideas May Lead to a Crash of Ideals

By An AMERICAN FATHER

ILLUSTRATED BY EDITH GRIEVE

WHEN I was a boy, I did not much care whether there was anything else in the world except my grandfather's farmhouse. This house was the center of the universe to me; the little horizon that came down around it was the rim of the world. I think my grandparents felt much the same way. The family, as a whole, was all that each member of the family needed. Three uncles, an aunt, my small sister, my grandfather and grandmother kept me constantly entertained. Especially at mealtime. There was so much story-telling, so much conversation. I remember once feverishly beckoning across the table to my sister when grandfather was telling of some exploit in his youth when he and his sister were in danger. I forgot who I was and thought I was my grandfather.

And the evenings were so delightful, provided my grandfather and the boys did not play the violin too much. It was a good many years before I learned to like the violin; I had to go away from home to become convinced of its musical possibilities.

Only once during my youth did anything really sad happen. My aunt went to Kansas. My grandfather took her to the train. I went with them to the station. He was strangely quiet on the way home. I looked up at him to see what was the matter. I saw wet streaks on his cheeks where tears had coursed down to his white beard. I said nothing. He said nothing.

I had to go out in the world to make my own living when I was fifteen. Every Sunday I walked seven miles, just to be home for a few hours. Monday morning seemed the blackest time in the week because it was farthest away from the next Sunday morning when I could go home again. A year or two were required to reconcile me to being away from home.

As I grew to manhood, I realized that it was the fate of man to have a wife and children and have a world of his own under his own roof. As the thought kept coming, it took hold of me. Where was the girl who was to be my wife? She must be somewhere, even at that moment. In due time, these questions were answered. I instituted what we called "Goodnight talks." Every evening the children were gathered around and asked what good things they had done that day. It was a little method I devised to make them kind. And it was so delightful. One evening a four-year-old, after much thought, triumphantly announced that he had not struck his brother that day.

While the children were still young, my thoughts went ahead to the time when they should be grown up. It was a little hard just then for the too indulgent mother, but it seemed as if, when they were grown and able to take care of themselves, there would be nothing to be desired. We should have their companionship without the cares and anxieties which children cause their parents. The house would ring with laughter and buzz with conversation.

Well, the children are grown, but nothing of the kind has happened. There are four of them, the youngest eighteen and the eldest twenty-five, enough to make a houseful, but the house is more nearly empty than ever it has been since they were born. They are as good children as anyone could desire, no drinking, no dissipating, no laziness—those who are not in school work harder than I ever did—and, if I may say so, I have always been a worker—but they are not at home much of the time.

As nearly as I can remember, each of them pretty much dropped out of the family circle when he was about fifteen years of age. At that time in each of their lives, high school work began to bear down upon them, and for five evenings of the week they studied from dinner until bedtime. The other evenings were taken up by fraternity meetings and the social life that goes with school. When they became old enough to work, they worked all day and oftentimes well into the evening. The boys like to work. As a result, we see them only a moment

"My thoughts went ahead to the time when they should be grown up . . . . the house would ring with laughter and buzz with conversation."

at breakfast, and for a little longer moment at dinner in the evening.

And, as nearly as I can ascertain from inquiries, all of the other parents are alone. My children seem astounded that we have regrets, and tell us that all of their friends are at home as little as they are, and that their parents do not care. Of course, other parents do care. They care because they are "old-fashioned" as our children say we are.

Here is a clash of ideas—the old against the young. And the parents are not winning this time, as they have usually won when they and their children have disagreed. The parents are losing. They are in contact with forces that seem to be too much for them. Nor is it that children have suddenly become stronger than their parents. The children are but instruments through which new and powerful social forces are operating. Transportation has not been revolutionized for adults alone. It has powerfully influenced the lives of boys more than fifteen. Most city boys begin to own automobiles by the time they enter high school. They begin with very poor secondhand cars with perhaps a dry-goods box for a seat and rapidly acquire better ones. By the time they are eighteen years old they have owned half a dozen cars. Parents do not object because they want to be reasonable and they know that other boys have cars. They may not like the idea, but they have to put up with it.

It is astonishing what an area a boy can cover with a car. Ten miles in any direction after dark means nothing. And in this twenty-mile circle he finds a lot to do—friends to visit, dances to attend and what not. With a car and a good list of chums, such as every lad has, a boy can be out all the time—as most boys are.

Now whether it is agreeable to parents to be left pretty much alone after their children reach the age of fifteen has nothing to do with what is happening or what is likely to continue to take place. It is important to the parents but apparently it is not important to the children. The children want to be out and they are out. The parents may not like it, but they have to put up with it. Yet there remain two very important practical questions for the older generation to consider, the first of which is, "What mental adjustments should parents try to make to enable them to endure the absence of their children?"

I put this question first because nothing in life brings so much pain as blasting the dream of companionship

"With a car and a good list of chums, such as every lad has, a boy can be out all of the time—which most boys are."

with one's children when they are grown. I counted upon it from the beginning. As the years went past I relied more and more upon the children and less and less upon the outside world. And then the children disappointed me.

I cannot blame them. I can put myself in their places. I know how strong is the pull from the outside. The young instinctively turn to each other rather than to the passing generation. But that does not make it any pleasanter for the generation that is passing. To understand why this thing is happening is not enough, in itself, to enable parents to forget their disappointment. Something more than that will have to happen. Parents will have to become mentally readjusted to the new situation.

The present generation of parents probably will not be able to do this. They may try but they will never get over the ache. But the next generation will succeed. What will have to happen is this: *The love of children, as such, will have to die earlier.* It always dies, anyway, to be replaced by a different kind of love. The intense love of children, as such, is really but a means that has been evolved to cause us to take care of them. How this happened is perfectly plain. The children that were best protected and cared for were most likely to live and become the parents of succeeding generations. By this sifting process none of humanity is left except those who love children. And they love them so much because they are so helpless. When the helplessness passes, the love begins to pass or, rather, to change. A ninety-year-old lady loves her seventy-year-old son, but it is not the love that she had for him when he was a baby. It is a different kind, perhaps just as deep but not so intense. He can be away for years at a time, and so long as she knows he is all right, she is in no misery. But when he was a baby she could not stand it to have him away from her for an hour.

The truth of the matter probably is that the children of today do not need their parents as much as did the children of all preceding generations. They know it and go out, but we don't know it and regret. Yet it can scarcely be doubted that the fifteen-year-old child of today is as well aware of the nature of the world about him as was the twenty-year-old of fifty years ago. The twenty-year-old, even of my day, was an awful boob. Any bright fifteen-year-old now could take some money in his pocket and travel from New York to San Francisco without a particle of difficulty. By moving more about in their world, the young of today know more of it. They do not feel much dependence, except for material things, and they know that, if pressed, they could earn the material things. They are not afraid and they know their way about.

Nor will the young of today carry into their maturity any recollection of their home life that will cause them to grieve when their own children become old enough to be gone most of the time. Their memories will mirror back to them no such home as my grandfather had. Instead, it will seem perfectly natural to them to see the family circle dissolve, except for sleeping and eating purposes when, one by one, the children reach the age of fifteen. Did they not do the same themselves? They did. They know it and they will remember it. So the wrenching of heartstrings will be only for the generation of parents that is now passing. They may be able to think the thing out and understand it, but they will never become reconciled to it. There will always be a little ache behind the picture on the wall of their memories—a little disappointment that home was not what they expected it to be.

I said there were two questions for parents to consider. Here is the other: "Is it good for the children to spend so little time at home after they are fifteen?" If I can sacrifice my own feelings long enough to get the answer down I'll have to say that *I think it is for their good.* I do not mean that no harm can come to them. A great deal of harm can come. But from that point of view, this world is an exceedingly dangerous place in which to live and nobody is ever really safe in it. We can only keep in touch with our children as best we can *(Concluded on page 28)*

# The Seven Poor Travellers

"I stepped backward into the road to survey my inheritance."

By CHARLES DICKENS

ILLUSTRATED BY W. W. CLARKE

STRICTLY speaking, there were only six Poor Travellers; but, being a Traveller myself, though an idle one, and being withal as poor as I hope to be, I brought the number up to seven. This word of explanation is due at once, for what says the inscription over the quaint old door?

RICHARD WATTS, ESQ.
by his will, dated 22 Aug. 1579
founded this Charity
for Six poor Travellers,
who not being ROGUES, or PROCTORS,
May receive gratis for one Night,
Lodging, Entertainment,
and Fourpence each.

It was in the ancient little city of Rochester in Kent, of all the good days in the year upon a Christmas-eve, that I stood reading this inscription over the quaint old door in question. I had been wandering about the neighboring Cathedral, and had seen the tomb of Richard Watts, with the effigy of worthy Master Richard starting out of it like a ship's figure-head; and I had felt that I could do no less, as I gave the Verger his fee, than inquire the way to Watt's Charity. The way being very short and very plain, I had come prosperously to the inscription and the quaint old door.

"Now," said I to myself, as I looked at the knocker, "I know I am not a Proctor; I wonder whether I am a Rogue!"

Upon the whole, though Conscience reproduced two or three pretty faces which might have had smaller attraction for a moral Goliath than they had had for me, who am but a Tom Thumb in that way, I came to the conclusion that I was not a Rogue. So, beginning to regard the establishment as in some sort my property, bequeathed to me and divers co-legatees, share and share alike, by the Worshipful Master Richard Watts, I stepped backward into the road to survey my inheritance.

I found it to be a clean white house, of a staid and venerable air, with the quaint old door already three times mentioned (an arched door), choice little long low lattice-windows, and a roof of three gables. The silent High-street of Rochester is full of gables, with old beams and timbers carved into strange faces. It is oddly garnished with a queer old clock that projects over the pavement out of a grave red-brick building, as if Time carried on business there, and hung out his sign. Sooth to say, he did an active stroke of work in Rochester, in the old days of the Romans, and the Saxons, and the Normans; and down to the times of King John, when the rugged castle—I will not undertake to say how many hundreds of years old then—was abandoned to the centuries of weather which have so defaced the dark apertures in its walls, that the ruin looks as if the rooks and daws had pecked its eyes out.

I was very well pleased, both with my property and its situation. While I was yet surveying it with growing content, I espied, at one of the upper lattices which stood open, a decent body, of a wholesome matronly appearance, whose eyes I caught inquiringly addressed to mine. They said so plainly, "Do you wish to see the house?" that I answered aloud, "Yes, if you please." And within a minute the old door opened, and I bent my head, and went down two steps into the entry.

"This," said the matronly presence, ushering me into a low room on the right, "is where the Travellers sit by the fire, and cook what bits of suppers they buy with their fourpences."

"O! Then they have no Entertainment?" said I. For the inscription over the outer door was still running in my head, and I was mentally repeating, in a kind of tune, "Lodging, entertainment, and fourpence each."

"I bent my head, and went down two steps into the entry."

"I never saw a finer turkey, finer beef, or greater prodigality of sauce and gravy; and my Travellers did wonderful justice to everything set before them."

"I set out for Watt's Charity, carrying my brown beauty in my arms."

"They have a fire provided for 'em,' returned the matron,—a mighty civil person, not, as I could make out, overpaid; "and these cooking utensils. And this what's painted on a board is the rules for their behaviour. They have their fourpences when they get their tickets from the steward over the way,—for I don't admit 'em myself, they must get their tickets first,—and sometimes one buys a rasher of bacon, and another a herring, and another a pound of potatoes, or what not. Sometimes two or three of 'em will club their fourpences together, and make a supper that way. But not much of anything is to be got for fourpence, at present, when provisions is so dear."

"True, indeed," I remarked. I had been looking about the room, admiring its snug fireside at the upper end, its glimpse of the street through the low mullioned window, and its beams overhead. "It is very comfortable," said I.

"Ill-conwenient," observed the matronly presence.

I liked to hear her say so: for it showed a commendable anxiety to execute in no niggardly spirit the intentions of Master Richard Watts. But the room was really so well adapted to its purpose that I protested, quite enthusiastically, against her disparagement.

"Nay, ma'am," said I, "I am sure it is warm in winter and cool in summer. It has a look of homely welcome and soothing rest. It has a remarkably cosy fireside, the very blink of which, gleaming out into the street upon a winter night, is enough to warm all Rochester's heart. And as to the convenience of the six Poor Travellers——"

"I don't mean them," returned the presence. "I speak of its being an ill-conwenience to myself and my daughter, having no other room to sit in of a night."

This was true enough, but there was another quaint room of corresponding dimensions on the opposite side of the entry: so I stepped across to it, through the open doors of both rooms, and asked what this chamber was for.

"This," returned the presence, "is the Board Room. Where the gentlemen meet when they come here."

Let me see. I had counted from the street six upper windows besides these on the ground-story. Making a perplexed calculation in my mind, I rejoined, "Then the six Poor Travellers sleep upstairs?"

My new friend shook her head. "They sleep," she answered, "in two little outer galleries at the back, where their beds has always been, ever since the Charity was founded. It being so very ill-conwenient to me as things is at present, the gentlemen are going to take off a bit of the back yard, and make a slip of a room for 'em there, to sit in before they go to bed."

"And then the six Poor Travellers," said I, "will be entirely out of the house?"

"Entirely out of the house," assented the presence, comfortably smoothing her hands. "Which is considered much better for all parties, and much more conwenient."

I had been a little startled, in the Cathedral, by the emphasis with which the effigy of Master Richard Watts was bursting out of his tomb, but I began to think, now, that it might be expected to come across the High-street some stormy night, and make a disturbance here.

Howbeit, I kept my thoughts to myself, and accompanied the presence to the little galleries at the back. I found them on a tiny scale, like the galleries in old inn-yards; and they were very clean. While I was looking at them, the matron gave me to understand that the prescribed number of Poor Travellers were forthcoming every night from year's end to year's end; and that the beds were always occupied. My questions upon this, and her replies, brought us back to the Board Room so essential to the dignity of "the gentlemen," where she showed me the printed accounts of the Charity hanging up by the window. From them I gathered that the greater part of the property bequeathed by the Worshipful Master Richard Watts for the maintenance of this foundation was, at the period of his death, mere marshland; but that, in course of time, it had been reclaimed and built upon, and was very considerably increased in value. I found, too, that about a thirtieth part of the annual revenue was now expended on the purposes commemorated in the inscription over the door; the rest being handsomely laid out in Chancery, law expenses, collectorship, receivership, poundage, and other appendages of management, highly complimentary to the importance of the six Poor Travellers. In short, I made the not entirely new discovery that it may be said of an establishment like this, in dear old England, as of the fat oyster in the American story, that it takes a good many men to swallow it whole.

"And pray, ma'am," said I, sensible that the blankness of my face began to brighten as the thought occurred to me, "could one see these Travellers?"

"Well!" she returned more dubiously, "no!"

"Not to-night, for instance!" said I.

"Well" she returned more positively, "no. Nobody ever asked to see them, and nobody ever did see them."

As I am not easily baulked in a design when I am set upon it, I urged to the good lady that this was Christmas-eve; that Christmas comes but once a year—which is unhappily too true, for when it begins to stay with us the whole year round we shall make this earth a very different place; that I was possessed by the desire to treat the Travellers to a supper, and a temperate glass of hot Wassail; that the voice of Fame had been heard in that land, declaring my ability to make hot Wassail; that if I were permitted to hold the feast, I should be found conformable to reason, sobriety, and good hours; in a word, that I could be merry and wise myself, and had been even known at a pinch to keep others so, although I was decorated with no badge or medal, and was not a Brother, Orator, Apostle, Saint, or Prophet of any denomination whatever. In the end I prevailed, to my great joy. It was settled that at nine o'clock that

night a Turkey and a piece of Roast Beef should smoke upon the board; and that I, faint and unworthy minister for once of Master Richard Watts, should preside as the Christmas-supper host of the six Poor Travellers.

I went back to my inn to give the necessary directions for the Turkey and Roast Beef, and, during the remainder of the day, could settle to nothing for thinking of the Poor Travellers. When the wind blew hard against the windows —it was a cold day, with dark gusts of sleet alternating with periods of wild brightness, as if the year were dying fitfully—I pictured them advancing towards their resting-place along various cold roads, and felt delighted to think how little they foresaw the supper that awaited them. I painted their portraits in my mind, and indulged in a little heightening touches. I made them footsore; I made them weary; I made them carry packs and bundles; I made them stop by finger-posts and milestones, leaning on their bent sticks, and looking wistfully at what was written there; I made them lose their way; and filled their five wits with apprehensions of lying out all night, and being frozen to death. I took up my hat, and went out, climbed to the top of the Old Castle, and looked over the windy hills that slope down to the Medway, almost believing that I could descry some of my Travellers in the distance. After it fell dark, and the Cathedral bell was heard in the invisible steeple—quite a bower of frosty rime when I had last seen it—striking five, six, seven, I became so full of my Travellers that I could eat no dinner, and felt constrained to watch them still in the red coals of my fire. They were all arrived by this time, I thought, had got their tickets, and were gone in.—There my pleasure was dashed by the reflection that probably some Travellers had come late and were shut out.

After the Cathedral bell had struck eight, I could smell a delicious savour of Turkey and Roast Beef rising to the window of my adjoining bedroom, which looked down into the inn-yard just where the lights of the kitchen reddened a massive fragment of the Castle Wall. It was high time to make the Wassail now; therefore I had up the materials (which, together with their proportions and combinations, I must decline to impart, as the only secret of my own I was ever known to keep), and made a glorious jorum. Not in a bowl; for a bowl anywhere but on a shelf is a low superstition, fraught with cooling and slopping; but in a brown earthenware pitcher, tenderly suffocated, when full, with a coarse cloth. It being now upon the stroke of nine, I set out for Watt's Charity, carrying my brown beauty in my arms. I would trust Ben, the waiter, with untold gold; but there are strings in the human heart which must never be sounded by another, and drinks that I make myself are those strings in mine.

The travellers were all assembled, the cloth was laid, and Ben had brought a great billet of wood, and had laid it artfully on the top of the fire, so that a touch or two of the poker after supper should make a roaring blaze. Having deposited my brown beauty in a red nook of the hearth, inside the fender, where she soon began to sing like an ethereal cricket, diffusing at the same time odours as of ripe vineyards, spice forests, and orange groves,—I say, having stationed my beauty in a place of security and improvement, I introduced myself to my guests by shaking hands all round, and giving them a hearty welcome.

I found the party to be thus composed. Firstly, myself. Secondly, a very decent man indeed, with his right arm in a sling, who had a certain clean agreeable smell of wood about him, from which I judged him to have something to do with shipbuilding. Thirdly, a little sailor-boy, a mere child, with a profusion of rich dark brown hair, and deep womanly-looking eyes. Fourthly, a shabby-genteel personage in a threadbare black suit, and apparently in very bad circumstances, with a dry suspicious look; the absent buttons on his waistcoat eked out with red tape; and a bundle of extraordinarily tattered papers sticking out of an inner breast-pocket. Fifthly, a foreigner by birth, but an Englishman in speech, who carried his pipe in the band of his hat, and lost no time in telling me, in an easy, simple, engaging way, that he was a watchmaker from Geneva, and travelled all about the Continent, mostly on foot, working as a journeyman, and seeing new countries —possibly (I thought) also smuggling a watch or so, now and then. Sixthly, a little widow, who had been very pretty and was still very young, but whose beauty had been wrecked in some great misfortune, and whose manner was remarkably timid, scared, and solitary. Seventhly and lastly, a Traveller of a kind familiar to my boyhood, but now almost obsolete,—a Book-Pedlar, who had a quantity of Pamphlets and Numbers with him, and who presently boasted that he could repeat more verses in an evening than he could sell in a twelvemonth.

All these I have mentioned in the order in which they sat at table. I presided, and the matronly presence faced me. We were not long in taking our places for the supper had arrived with me, in the following procession:—

Myself with the pitcher.
Ben with Beer.
Inattentive Boy with hot plates. Inattentive Boy with hot plates.
THE TURKEY.
Female carrying sauces to be heated on the spot.

(Continued on page 21)

"My travellers right and left on either side of me, round the fire, myself and my chair closing up the centre."

# The Story of the First Christmas

AND it came to pass in those days, that there went out a decree from Caesar Augustus, that all the world should be taxed.

(And this taxing was first made when Cyrenius was governor of Syria.)

And all went to be taxed, every one into his own city.

And Joseph also went up from Galilee, out of the city of Nazareth, into Judaea, unto the city of David, which is called Bethlehem; (because he was of the house and lineage of David).

To be taxed with Mary his espoused wife, being great with child.

And so it was, that, while they were there, the days were accomplished that she should be delivered.

And she brought forth her first-born son, and wrapped him in swaddling clothes, and laid him in a manger; because there was no room for them in the inn.

And there were in the same country shepherds abiding in the field, keeping watch over their flock by night.

And, lo, the angel of the Lord came upon them, and the glory of the Lord shone round about them: and they were sore afraid.

And the angel said unto them, Fear not: for, behold, I bring you good tidings of great joy, which shall be to all people.

For unto you is born this day in the city of David a Saviour, which is Christ the Lord.

And this *shall be* a sign unto you; Ye shall find the babe wrapped in swaddling clothes, lying in a manger.

And suddenly there was with the angel a multitude of the heavenly host praising God, and saying,

Glory to God in the highest, and on earth peace, good will toward men.

And it came to pass, as the angels were gone away from them into heaven, the shepherds said one to another, Let us now go even unto Bethlehem, and see this thing which is come to pass, which the Lord hath made known unto us.

And they came with haste, and found Mary, and Joseph, and the babe lying in a manger.

*ST. LUKE II.*

# Mr. Ford's Page

NO ONE now denies that a sufficient amount of hardship and opposition is necessary to develop strength—any kind of strength. We recognize that in our games: all the sports of our people consist in surmounting some kind of opposition; there is always a contest. We recognize that in the world of make-believe: all our novels are tales of the manner in which people meet and attack the difficulties of circumstance. Hardships that harden without harshening, that develop strength out of weakness, and resistance out of softness, are recognized as good.

It is sometimes a question how far it is wise to save people from the ordinary course of hard knocks. There is in this and every country a great mass of people who are honest, easy-going and virtuous, who nevertheless are a fertile field for the play of every kind of fake and fallacy. They are the people who are usually "taken in" when there are real estate booms. They are the people who patronize the glib armies of salesmen who peddle stock which is guaranteed to make the poorest subscriber a millionaire in a month. They are the people who are most easily deceived by the illegal use of an honest industrial name by dishonest fakers. They are the people who give point to the shrewd observation that "there's one born every minute."

Now, in one view their plight is such as to arouse moral indignation and sympathy in their behalf. In many cases the deception of which they are victims means a lifetime spent in recuperation. Few there are who do not know the tragedies caused by the unscrupulous panderers to the material ambitions of the masses. They are bunkoed right and left by promoters, politicians, fake medical men, religious charlatans, real estate exploiters, high-power stock salesmen and the rest.

In another view, how can these people learn to use their eyes and their reason other than by having them tested in actual experience? How are they to learn that it is impossible to get something for nothing, except by trying it and failing? It is safe to say that no swindling scheme would ever succeed, or any doubtful scheme ever get a start, even among the masses, if the average man used his average common sense—or any common sense whatever.

As long as there are people capable of being victimized, there will be those ready to do it. As long as there are weak, unresisting human constitutions, there will always be disease. As long as there remains anywhere the capacity to be enslaved, the slave master will always appear. In view of that, where is the better place to begin: with the disease, or with the patient's power of resistance? In medicine, it is with the latter. In a community immunized to "something for nothing" schemes, what happens to the swindler? The same thing that happens to a disease germ that wanders into a healthy resistant body—it doesn't get anywhere; it dies for want of nutrition. Swindlers fail when victims think.

*WHETHER to be sorry for the victims of swindlers, or glad that they are getting experience; whether to desire a spineless population never tempted to folly, or a strong people who are proof-against it: these questions occasionally arise. Scientists who have fought rust in wheat and blight in corn are now considering whether it is not better to grow wheat that will resist the rust, and corn that will defeat the blight. If rust-proof wheat is a possibility, surely folly-proof people are equally possible. The swindlers who take millions a year from the people would fail if people were swindle-proof. And most of them would be if they refused to heed tales of something for nothing.*

The race has won its immunity from many diseases by the strength which it has stored up under numerous attacks. It is a beautiful law that when an attack is made, the body produces a defense out of its own resources. The body, that is, has experience of a certain disease; out of the experience it produces the antidote which renders that particular disease powerless in the future. "I am immune; I have had it," men say. But in business affairs, seldom is immunity so easily won. It often takes more than one or two sieges to convince men of their folly—especially this "something for nothing" folly.

However this may be, it is certain that all forms of disease, physical and social, will disappear, when there is no organism left in which they can flourish. There are scabs that attack the apple, blights that attack the corn, rusts that attack the wheat. For a long time we have been spending time, money, ingenuity and material in fighting the scabs, the blights, the rusts.

Now, however, the men who work in that field are thinking that perhaps they have been focusing their fight at the wrong end of the problem. They have spent their time with scabs and blights and rusts, when they might better have spent it with fruits and corn and wheat. So they have been reasoning this way: if it is possible to grow an apple that will refuse to have scabs; to grow corn that is not capable of being blighted; to grow wheat that is immune to rust, surely that is the way out of the difficulty.

Of course it is. It is the way out of all these difficulties. Grow people that will resist the impostures of dishonest propositions, and you have deprived all the exploiters of their gain. People who use eyes, ears and mind are seldom dupes of anyone.

## *Christmas, 1925*

CHRISTMAS will begin too late if it wait until the day itself. For Christmas comes neither with the dawn of yule, nor passes with the candle and the feast. It is a season which precedes the Day and lingers on past Twelfth Night. The true instinct of the church descries Christmas from afar, as did Mary the Mother and the Wise Men of the East; the season of Advent is a preparatory ascent toward the holy time, an invitation to journey toward Christmas in quiet expectancy. The approach to Christmas through feverish shopping days, in fond hope that the calendar will infallibly bring the Christmas spirit, is of all futile things most futile; the bitter reaction finds expression in the wish that Christmas might be abolished. And that will probably come; the kind of Christmas we have been keeping, without the expectation, the hope and beauty, the glowing truth of Advent, will certainly be abolished; it will abolish itself, for it is no true Christmas.

Christmas of all the year is the most natural of our festivals. It lights a fire at the cold heart of winter; it brings the comfort and living promise of a Cradle when all the world seems dead. It is the Festival of The Child, the enthronement of common things—Bethlehem, the stable, flocks, plain folk, swaddling clothes. It is the Festival of All People, for the Advent was not a ceremonial occurrence within priestly walls—the events which gave us Christmas transpired in populous places, with old folk, and shepherds, and pilgrims, and tax officials all around. It matters naught to the fact whether folk accept the Christmas teaching; a fact is not dependent on acceptance; but when the world a moment stops to think, it knows beyond the whisper of a doubt that the greatest fact in human history was the arrival of a Person on this planet, whose coming split history in two, and since whose Advent the world has been a different place, and whose Birth is marked by Christmas. Where His name is enshrined the people have security, little children are reared in plenty, women are honored, public order is a religion. Where His name is little known, the light has not yet dawned.

One need only take a globe and mark the countries where Christmas comes, to mark the countries where humanity approaches the status it was meant to attain. That is to say, Christmas marks the coming into the world of a new force whose beneficence has never ceased; a force so human and compassionate that little children sing of it with joy, and yet a force so godlike that angels sounded its marching music to this world. The fires that burn on happy hearthstones are its altar-fires, the cherishing of children's joy its alms, the loyalties of friendship its shining ritual, and its sacraments are Christmas cheer, Christmas charity, Christmas hope.

## *General Butler Quits*

IN THE fight between crime and law, which was staged in Philadelphia, crime has won. It has won with the consent of the decent elements in that city, at least so charges Brigadier General Butler, of the Marines, who has been Philadelphia's police chief for several years. He says that when it came to a fight, everyone ran away but the Mayor of Philadelphia. The decent classes, says General Butler, lampooned him, ridiculed him, ostracized him, showered him with contempt and in every possible way neutralized his efforts. He leaves his work, he says, with disgust; nothing could induce him to undertake civil service again except in war time.

Allowing for the element of bitterness which failure breeds, there is truth in what General Butler says, not only as regards Philadelphia but every other city. Crime exists with the knowledge and consent of the Citizen. The average citizen has resigned even his sense of citizenship; he is as detached from his home-town as he is from Rome or Athens. He looks on the local government as a strange group. The city hall crowd are one party; the police crowd are another party; the gunmen, gamblers and their followers constitute another compact group; all of them are more or less in sympathy with one another, have understandings and accommodations; but none of them understands or has much traffic with the citizen, nor the citizen with them. Even the newspapers voice downtown sentiment regardless of the residential sections. The city has been taken away from the Citizen with his consent, because he has delegated his responsibility to officers, without tying up their responsibility to him.

To this extent General Butler is right.

## *The Old American Dance*

ONE of the astonishing features of the autumn and early winter has been the widespread revival of the old American dances. After long neglect they are now discovered to be the very thing that a jaded generation has been looking for. The old music, the neighborly mingling of people in the square dances, the rollicking reels and joyous jigs, together with the vocal harmony of the calls, are all found to import a pleasure which the more sophisticated of the manufactured dances and the synthetic music of Tin Pan Alley (N. Y.) cannot give.

Twenty years ago the arrival of the new fad in dancing drove tens of thousands of mature dancers from the floor, and the more promiscuous methods adopted for public dancing drove the more reticent away altogether. Now, however, the older and more American dances return with a novelty they could hardly have had except for this rest of two decades. They come again as new, to both the old and the young. To the young they are, of course, all novelty, "the very latest." The play spirit, which the young have vainly sought in the newer forms, has been abundantly found in the classics of the other generations. The great triumph of the old American dances is that they have so overwhelmingly approved themselves to the younger American generation. This shows that both the dances and American youth are good at heart. More than that, it increases the sum of pleasure in this land, of which we have never had too much. We have learned to work, but we have somewhat neglected the equally important part of play. We are learning to play in the large-hearted, social and wholesome way of those whose characters and traditions shaped the nation.

Though the dance has somewhat departed from our practice these recent years, it cannot be said to have departed from our art, literature and music. It was never completely absent from our national thought of merriment and play. Its return argues a better balancing of life in other respects as well.

## *More Light*

ON PAGE ONE of all the newspapers we read, day after day, in prolonged series, with many side lights, the tale of one Captain Paul Foley's attempt to intimidate, perjure and otherwise tamper with the testimony of Mrs. Lansdowne's testimony at Washington. Captain Foley was at the time Judge Advocate of that particular inquiry.

On Page Fifty-eight of this day's paper (November 20), in an obscure corner, we read of Captain Paul Foley's exoneration by the court of any intention or attempt to do the things charged against him.

But nowhere, on any newspaper page, have we read that it was the sworn duty of the Judge Advocate to make preliminary examination of the testimony to be given by witnesses appearing before the court-martial. Every newspaper account which we have examined carried the implication that this officer, by stealth and in violation of all decency, sought to suborn the testimony of the widow of the *Shenandoah's* dead commander. No newspaper account informed its readers that Captain Foley was following with precision the legal forms prescribed for military inquiries. That he called on Mrs. Lansdowne at all was made to seem an evidence of his criminal intentions. No newspaper correspondent covering the trial thought it worth while to give the Army and Navy forces of the United States a plain square deal.

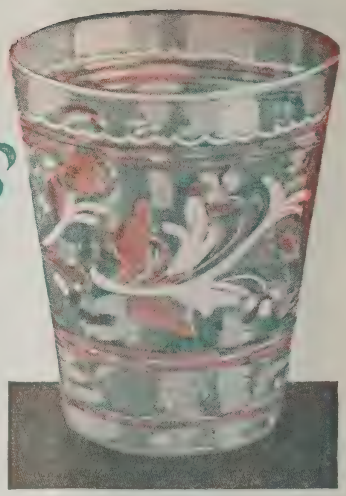
This is the thing which is constantly found in the Mitchell propaganda—its acquiescence in misstatements which invite public contempt for the Army and Navy. When Colonel Mitchell finished his tour of duty as air-chief and went back to his former rank, the routine demotion was called "persecution." When his utterances (made for that express purpose) forced his superiors to call a court-martial, it was trumpeted abroad as another instance of official persecution. When Captain Foley followed regulations in interviewing a witness, it is assumed without question that procurement of perjury was his motive.

These are exceedingly bad tactics; their consequences on all sides are such as to suggest that this Bolshevist attack on American institutions—for such are the Army and Navy—should cease. We make a distinction between Bolshevist attacks and sound American criticism.

## *Youth Movement*

IN A Michigan small town Armistice Day came round. Men had gone from that little town in 1917, some of them came not back, but most of them had brothers. When these youngsters went to school on the morning of November 11, they noticed that no flag was flying from the mast atop the schoolhouse. Thereupon, dispersing, they went home, gathered up flags and marched through the town. The school authorities explained that there was a flag displayed, but it was inside, in the school hall.

This typifies the true Youth Movement. Of the opposite type we have heard much and have seen little. There is no doubt that alien and anti-American influences have much desired to capture Young America, and have even made attempts at it, but there is equally no doubt that it is impossible.



A valuable Steigel bottle.

# Valuable Old American Bottles

## Bottles Are Not Usually Collected But Discarded, But Here Are Some Specimens That Belong to History

By MARY HARROD NORTHEND

Another piece of Steigel ware.

IN THESE days of prohibition few persons have cause to think about the old bottle creations whose fancy forms and quaint ornamentations made them a distinguishing feature of American life during the rum, hard cider and whisky days of the past. The subject commands the attention of collectors today, for old bottles, their history and developmental changes, offer a field of absorbing interest to those who may be interested in their country's past. Even in this day it is possible to see in some homes queerly shaped containers which are being saved for their unique beauty as bottles. For such a collector, then, what possibilities exist in bottles of other times! Anyone who can be attracted by the shapes and designs of present-day bottles should be more than interested in the even more odd and ornate creations of bottle-makers of seventy-five and a hundred years ago.

The history of bottles in this country is almost inseparably tied up with the history of glass-making. Odd as it may seem, the first enterprise of note established in this country was a bottle manufacturing plant at Jamestown, Virginia, or rather in a dense forest about a mile from that early southern settlement. We can imagine the surprise of the native Indians when they first saw the white men pouring water or wine into these crystal-like bottles instead of into the skin bottles or canteens which were the utensils used by the natives for such purposes.

Left—One of the popular "Jenny Lind" bottles.

Right—"Moses" bottle.

The fact that glass bottles were made before any other kind of glass products in the Colonies is worthy of note. Subsequently other factories were started, many of them with the purpose of manufacturing trinkets such as glass beads, to be used for barter with the Indian neighbors.

The oldest glassworks still doing business, which has been uninterrupted since its beginning, is located at Kensington, Philadelphia, and dates from 1711.

Perhaps the earliest glassware used in this country were the plain and cut glass decanters which originally were imported from England during the Colonial era.

Connected with them is the tradition, now long since abandoned, that drinking vessels of glass, when made under certain combinations of astronomical conditions, would fly to pieces if any poisonous liquid were poured into them, and that drinking glasses of colored ware added flavor to wine and detracted considerably from the intoxicating effectiveness of the drink. The English "toddy glasses," forerunners of the modern tumblers, enjoyed the conditions of this old tradition. Most of the pieces of this era, such as the fine-cut decanters, are extraordinarily valuable today because they cannot be duplicated anywhere. Needless to say, the early American bottle-makers were much influenced by the kind and variety of pieces which had been imported from the mother country, and decanter-shaped bottles were among the first products on this side of the water.

Also of interest in this connection is the fact that as early as 1750 a certain immigrant baron from Mannheim, Germany, was manufacturing what is known as "Bohemian glass" in a shop near Philadelphia. This was William Henry Steigel who built his glassworks, a dome-shaped affair, large enough to permit a coach-and-six to drive in and turn around. Here he brought skilled workmen from the best factories of Europe and proceeded to turn out a richly colored, true Bohemian product which is now very valuable. According to taste, of course, there is virtually nothing in fancy glass which can compare in complete beauty with the real Red Bohemian glass decanter, and it is little wonder that Baron Steigel's bowls, goblets

and other pieces with their inimitable ruby tone, sometimes in delicate two-tone, red and white effects, should be so highly prized. And yet, in spite of the beautiful things which came from his shop, Baron Steigel failed in business within five years of beginning.

Of all the old glass made in America, perhaps the genuine old-fashioned bottles form the most interesting portion of history. Late in the eighteenth century fancy pocket flasks and bottles came into use and it seems to have been a matter of rivalry or keen competition that resulted in some of the ornamental devices which we find on them. Like the old potters, products were made to appeal to the potential purchaser through sentiment by opportune sketches and quotations, representations of contemporary events and patriotic or partisan feelings. The decorative sketches, ranging from simple floral wreaths to elaborate, complicated borders around portraits or scenes in high relief, were blown in engraved metal molds which had been prepared by professional mold-cutters.

In most cases it is difficult to determine the precise age of pieces which now and then come to light from old cellars or attics or reclaimed dumping grounds. Colors and sizes vary too much to be a good test. In general, it follows that all the older forms can be identified by their sheared necks and rough bases; the necks were sheared off with scissors, leaving them irregular and without finishing bands, and the base always showed a rough, circular scar which resulted from breaking the bottle away from the rod which held it while the workman was shaping the neck. Smooth and hollow bases were made during the period just preceding our Civil War, this improvement being made possible by a new process which employed a "snap" or case for holding the bottle. By similar improvements in methods, the products at this time also had rims added to their mouths. The ornamental schemes were worked out in transparent white, pale blue, sapphire blue, light green, emerald green, olive, brown, opalescent, or claret. Of the creations of this period twenty-nine interesting specimens are known which bear for ornament some form of the American eagle; nineteen have varying schemes built around the bust of Washington, and twelve employ the head of General Taylor.

The passing of time and the changing of taste brought new variations in shapes and in decorative designs. While the very earliest types were slender and arched in form with edges horizontally corrugated, the bottles of a slightly later time were generally oval-shaped with edges ribbed vertically. Following this fashion was the circular type with plain, smooth edges and at this same period some pieces show a kind of collar at the mouth. Then came the calabash or decanter shapes, no longer flattened or shallow, but almost spherical with edges that showed vertical corrugation, ribbing or fluting; these had long, slender necks with finishing caps at the mouth, hollowed smoothly or roughly at the base. The decanter had a long vogue.

After them came bottles arched in form, deep and flattened, having vertically corrugated edges, short broad necks capped with round and narrow heads; the bases were either scarred or flatly smooth. This type of bottle was generally in use until the modern flask shape displaced it. The flask with a broad shoulder, narrow base, plainly rounded edges, was not so ornate or elaborate but it served the purpose most efficiently. At this time there was also a revival of taste for the flattened, shallow types of the earliest manufacturers and many bottles of this period can be found today, having the distinguishing single or double beading at the mouth and the flat hollowed base usually smooth.

The most noted bottle designs date from the middle of the last century, such examples as the Kossuth and Jenny Lind bottles being particularly well known. It is an interesting fact that every period has been reflected in its bottles and at no time was this more true than when the containers were made with busts of the Swedish Nightingale on their sides. This was during the famous tour of the East in 1850 under the auspices of P. T. Barnum. It was the singer's daily custom to visit Tremont Temple, where she was appearing, to become familiar with its acoustic conditions. Each day the corridor was crowded with people eager to greet the most popular woman of the time, who, realizing the inability of the majority to meet the "popular" prices, walked back and forth through the assembled multitude with smiles and greetings for everyone. Today such a thing would be called a publicity stunt, and perhaps it was, at any rate it was just another of the little things which

Booz's "Log Cabin" bottle.

Left—"Fish" bottle.

"Success to the Railroad" bottle.

helped to swell the popular admiration of this remarkable woman. This admiration is reflected in the countless thousands of bottles which were turned out during her reign with her portrait for decoration.

*The Log Cabin Campaign and E. C. Booz*

Other portrait bottles carry similar reflections of public feeling at the time of their manufacture and sale. Between 1833 and 1837 the Kensington works turned out a dark-amber bottle with a creditable representation of a horse drawing a four-wheeled cart on rails; this was to commemorate the completion of the fourteen-mile-long Baltimore and Ohio Railroad. The length of the picture required lengthwise portrayal on the side of the bottle, thus making the horse top the cart when the bottle was standing upright. Upon the margin of the panel appeared "Success to the Railroad." This decorated bottle is typical of that period of wild popular enthusiasms, of terrific political campaigns, of portrait chinaware and national expansion. The country was virtually "bottle mad" and between the years 1840 and 1860 every factory in the land boomed the decorated bottle, with all sorts of freak designs, novelties, jokes and advertising sketches of their faces. Such old concerns as the Kensington works at Philadelphia and the Whitney Glass Works (now a part of the Owen Bottle Company of Toledo), of Glassboro, New Jersey, have in their collections eloquent examples of the surpassing fad of that quarter of a century. More or less suddenly the bottle bubble burst and this type passed into oblivion, only to be sought after and made valuable years afterward by collectors.

Many of these bottles are extremely interesting and their stories vastly illuminating. For instance, there was a distiller named E. C. Booz in Philadelphia at the time of the "Log Cabin Campaign"; for him the Whitney concern put out thousands of bottles in the shape of eight-inch-high log cabins, supposed to hold a quart, the cabin being symbolical of the birthplace of William Henry Harrison, whose campaign for the presidency was perhaps the most heated in all our history. So scarce and unobtainable have these become that today they cannot be purchased for less than forty dollars and often bring as high as sixty or seventy, perhaps because our recently abandoned slang term for whisky—"booze"—derives from the distiller who used these hard liquor bottles.

Another valuable specimen, the Jackson bottle, belongs to the period of the "stormy thirties" when the hero of New Orleans was on the rampage. On the bottles he is represented in uniform with a throat-cutting collar which entirely obscures his ears. On another, the Taylor bottle, the portrait is inscribed with these words, "Taylor Never Surrenders" and on the Taylor-and-Bragg variety, the hardy old leader is represented as saying, as he did at Buena Vista, "A little more grape, Captain Bragg."

Then, too, there came into vogue a great variety of decorative designs centering in flowers, fruit, cornucopias, rural scenes, fraternal emblems (particularly Masonic, dating from about 1848-50), ships and eight-pointed stars, panels of fruit and grain, and one had a bold Pike's Peak pilgrim with staff and bundle—which, of course, dates from the first successful passage of the Rocky Mountains. Other interesting types are indicated in the specimen made by a Pittsburgh concern, which shows on one side an eagle monument and flag, and upon the reverse in the foreground an Indian with bow and arrow shooting a bird, with a tree and dog in the background. There was doubtless an almost infinite variety of design on these old glass products and it makes the sincere collector's blood run to tears just to think how many valuable specimens must be hidden away in old houses today unbeknown to their occupants. Every now and again an hitherto undiscovered design

*Something About Medicine Bottles and Ink Bottles*

appears from an obscure corner of the country, sometimes with extra-fancy ornamentations featuring animals, fishes, eggs, pickles, canteens, cigars, shells, pistols, violins, horns, lanterns, lassoes, prospector's implements and other equally prosaic and commonplace articles of social life. Sometimes unique shapes also appear, shapes such as the "glass fish" and the "Moses" bottle or "Santa Claus." The hope of finding relics such as these is in the heart of every collector or other individual who has the least interest in bottles.

Numerous enviably complete collections exist, both private and in our large museums, which are in most cases accessible for inspection. W. S. Walbridge, of the Owen Bottle Company, has an excellent assortment of varied types, some of which come in a class which is not ordinarily sought by collectors. He has, for example, several specimens of pre-1860 glass jars, such as were used for preserving fruit, ranging in size from small rough-mouthed cup-like pieces to tall affairs which resemble the modern milk bottle in shape. Other interesting pieces in this collection are old ink bottles with quills inserted, medicine bottles such as were used by the big patent medicine and proprietary preparation concerns, a toby bottle (shaped like one of those old mantel decorations), a Baltimore monument shape, another shaped like a domino block, another of a bear for Russian Kümmel, another of a standing Indian for Indian bitters and another of Moses-Smiting-the-Rock. Such freak bottles when viewed in their proper chronological classification form an interesting and illuminating study.

The bottle-making industry as it stands today is far removed from those ancient workmen's tables which produced the artistic Egyptian glassware and is an amazing development in many ways from the small works which gave to the world the magnificent Venetian ware in such small quantities as to be almost priceless, and, except to the studious eye, there seems to be little in common between the modern leviathan-like dimensions of the industry and those small shops from which those old portrait and freak bottles came. In a single year since 1917 one concern reports that it produced more than a billion and a half bottles. The milk bottle, which is a rather recent contrivance, was turned out to the number of one hundred and sixty million (160,000,000) in a single year by a single company. Truly this is the day and age of quantity production and standardization—the results of which are readily seen in the habit we have of considering all things so produced as serviceable necessities but otherwise valueless. Perhaps the day may come when our well-known milk bottle will have become a rarity, worthy of collectors' attention and bringing astonishingly high prices when found in excavations of old diaries or in old deserted houses. Perhaps some day the oddly shaped perfume bottles of the present day will be as seldom seen as is now one of those Log Cabin whisky bottles by way of which Mr. Booz established his name in the lexicon of liquor. The way of history teaches us that what is today a commonplace may be tomorrow an unobtainable and much desired antique with very apparent qualities of beauty. Yet I doubt if anyone will start collecting milk bottles or perfume bottles on the strength of this teaching.

*Delicate Creations in Old Attics and in Trunks*

At any rate, old bottles have a peculiar allure which, if given a chance, will not be denied. Casper Wistar's artistically designed pieces, the tiny flasks so small as to fit snugly into one's glove or pocket and so exquisitely colored, are considered priceless possessions. Some of Wistar's little pieces are decorated with colored glass ribbons running up and down the sides; on a few a tiny sea horse stares impertinently from a delicately wrought surface. There was a time not so terribly long ago, when the grandmothers could not go to church without their minute, gourd-shaped bottles containing salts which were resorted to at various times throughout the more-than-an-hour-long sermons of those days. Very often one comes upon such tiny affairs in museum collections.

And these delicate creations are not long past, either, and can still be found uncherished in many an attic's old trunks and boxes. But if the collector desires to go back farther, farther even than the modes in vogue in Europe before the discovery of America, let him seek (Concluded on page 24)

# Christmas With the Pennsylvania Dutch

## A Glance at Things Old But Still Very New

ALL my Christmas memories are tinged by my first Christmas away from home. It was more than thirty years ago, and I was then a bride of a few months. The house in which we were living, in a small Pennsylvania town, was hardly home. "It takes a heap o' livin' in a house to make it home," as Edgar Guest says, and we had lived there only a short time. Though we had not left our home state, this Dauphin County seemed like another country. The people were Pennsylvania Dutch; their customs were different, and up to this Christmas morning, their funny expressions had given me much quiet amusement.

But this morning was serious; nothing was funny. Christmas had always seemed to me the happiest and brightest day of the year. I did not know it could be so bitterly lonely and cold and gray.

The tall gray-green cupboard doors scowled down on me; the blank, desolate stare of the windows struck loneliness to the soul; beyond the little square panes was mound on mound of snow framed by cold and leafless trees. Here and there a cottage, but it meant nothing—mere buildings.

There was one way to shut it all out. I closed my eyes and saw the family at home, gathered around the breakfast table; saw them all laughing and happy. I could hear them telling with zest how they had been nearly caught bringing in some gift. I could see father smile his delight at all the surprises—dear old father, I knew he missed me and felt my absence that Christmas morning. Then the flood broke.

Home of the bride and groom.

One of the girls

"Mister."

A loud rap on the kitchen door! Tears were hastily dried, and when the door was opened, it disclosed two men with a large crate. It must be some mistake, I insisted; but investigation proved that it was mine, so the crate was brought inside, and left little room in the kitchen. A few minutes of frenzied tearing of wrappings revealed between the strips of a crate a beautiful couch, the gift of sisters and brothers.

Another rap at the door! A messenger with a special delivery letter from father, containing a check. Now the flood was loose. With a little homesickness, a little joy and a bit of self-pity, the tears blurred my eyes so it took a long time to read the letter.

Some one at the door again! Was this some trick? Choking back the tears, I answered the door once more. This time it was Alice H., the girl next door, come to wish the newlyweds a Merry Christmas. "Or isn't Mister at home?" was her surprised inquiry. Reassured that he was just catching up on sleep, she explained that Bessie had come in the previous night and was also sleeping in. Bess was a student at Westchester Normal School. Finally, "Well, Missus, I will go home yet and help get dinner started. You have your breakfast and slip on your hat and coat and we'll all run down to see Uncle John's."

Alone again! But now it was less lonely. Each time the door had opened, a great wave of Christmas cheer had floated in. After coffee, things began to systematize. Dinner here must be started, too. That big turkey must go in the oven. I smiled a little when I remembered how big and impossible he had looked when he had been brought in. The company gave every office man a turkey, and we had exclaimed with consternation over our fine gobbler. But it did not prove so impossible after all, for the next morning one of the neighbors had come in excitedly. Walter was to take part in the school entertainment and must have a kingly robe trimmed with ermine, and a crown. She, poor little mother, was completely at sea. In the old days at home, as the oldest sister of five live-wires, plays and costumes were quite in my line. It seemed like old times, and so it was real fun for me to make Walter's outfit. In good old Dutch fashion, Walter's mother just quietly took the turkey to her house and dressed it. And here it was, all ready for the oven. Alice and (Concluded on page 24)

# "And It Came to Pass in Those Days"

## Fathers and Mothers of Fifty Years Ago Did Things Differently to What We Do

By PHILIP F. KING

ILLUSTRATED BY RUSSELL H. LEGGE

FIFTY YEARS AGO HUSBANDS AND WIVES MADE AND MAINTAINED REAL HOMES. The old-fashioned home was a great institution and, next to the church, has exerted the most whole-

some influence on the life of our nation. In this home the father was the head of the family. The mother was supreme in the domestic and social features. The family gathered together at mealtime and good table manners were high marks of etiquette. Children were supposed to be quiet and listen to their elders. No ten-year-old boy or girl ever dared to lead and monopolize the conversation. Children were not allowed to eat meat for supper—it gave them bad dreams. Discipline was strict. Boys and girls *actually obeyed their paren's*. They either spent every night under the home roof or the parents knew where and with whom the boy or girl was spending the night. No child ever called on a chum or friend without permission.

Young married couples did not move to a flat; did not rent rooms for "light housekeeping"; did not sleep in apartments and take their meals at restaurants. They went to a house and made a home. Children were born, welcomed and reared in that home. They were taught to obey authority, to live together in peace and happiness, to be respectful and reverent, and to believe in God. The saddest fact in our national life today is the almost complete abandonment of true home-life by young couples.

FIFTY YEARS AGO REAL HOSPITALITY WAS EXTENDED. People liked other people, trusted and enjoyed them and gave and received invitations. Welcome was a big and meaning word. Hospitality was written in every man's heart. Company was prized and enjoyed. Sometimes one entire family would "spend the day" with a neighboring family. The children would play, the men would sit in chairs or on benches under the shade and talk crops, politics and the autumn fair. The women gossiped of style, weddings, canning fruit and other topics dear to the feminine mind. Newspapers were not so numerous as now and nearly everyone had some news to impart. The hostess for the day was not "put out" or embarrassed. If very intimate, the visiting lady would help in preparing the dinner.

Sometimes fifteen or twenty young people would go from church to "Grandpa's" and were received joyfully and fed bountifully. And no one enjoyed the day more than "Grandpa." The young people were not invited but were expected.

"Pop calls" were never made. Cards were not offered as visits. Families vied with each other in their invitations to dinner. Among these friendly and sociable people hospitality, warm-hearted and free, should be written with a big H. This old, kindly, neigh-

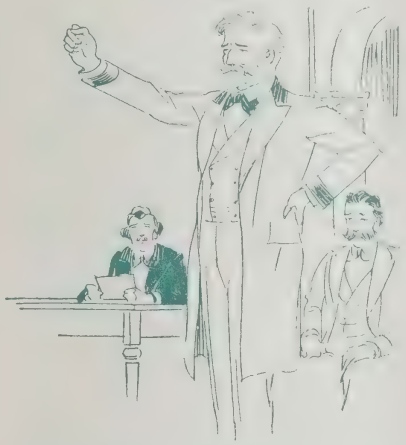
borly spirit has been crushed by our modern commercialism and love of selfish pleasure.

FIFTY YEARS AGO YOUNG PEOPLE HAD PARTIES. They played games in which all took part. There was no pairing off in dark corners. "Spinning the plate," "Poor Pussy wants a corner," "Dropping the handkerchief" were the most popular. Charades grew in favor with the young men and ladies. Ice cream was rare and considered a delicacy. Pig-foot gelatine was an acceptable dessert. At the parties the older folk were present and looked on with keen interest. "Virginia reel" was the only kind of dance allowed and in this the older people frequently took part.

Engagements were regarded as sacred and usually resulted in marriage. Divorce was rare. Courtships were long. Elopements did not often take

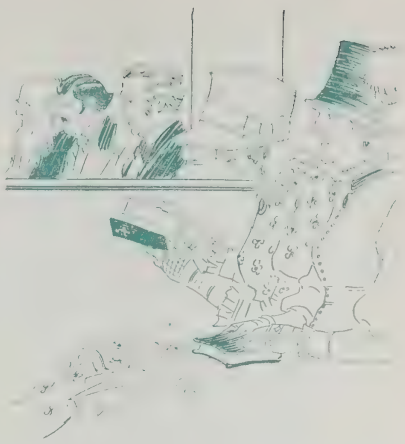
place. The young man usually spoke to the girl's father first. Gaining his consent, he "popped the question" to the girl. Marriages were notable events. The boys gave the groom a ride on a rail or some other form of charivari, which must be accepted in good-nature. Some kind of a 'ollification was tipped to the interested parties and refreshments of cake and custard were prepared and served.

FIFTY YEARS AGO GRANDMA'S PRESENCE IN THE HOME WAS A BENEDICTION. She was loved, humored and given respectful consideration. She encouraged her son, counseled and assisted her daughter-in-law and spoiled the children. She was the family physician, surgeon and nurse. She knew more about old-fashioned stomach ache, mumps, measles, chicken pox, stone bruise, cuts and worms than any doctor in the community. She was a great believer in oil, liniment and home-brewed herbs. She had a special chair in a special place. A lace cap covered her silvered hair and the needles played until the warm socks were done. She read her Bible every morning and on Saturday night taught the children their Sunday school lesson. She lived in the past, except when Bobby's buttons and Corinne's curls and the masculine marauders called her to the actual present. She sat in the "Amen" corner and beamed upon the preacher, and she believed every word he said. When she "spent the day" with a neighbor, something was lacking in the home. No one could define it but all felt it. Except when "poorly" she was cheerful and sweet-spirited. The



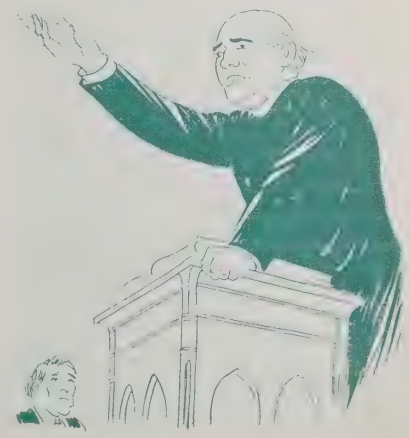
fragrance of her devout life was felt by all, and when she was taken by the angels that fragrance lingered, and her empty chair, with a shawl over the back, was touched with tender hands.

FIFTY YEARS AGO THE COUNTY FAIR WAS A GREAT AGRICULTURAL AND SOCIAL EVENT. Immense crowds attended, friends met friends and the big basket dinners offered ample opportunities for gossip and association. "The Fair" was not featured in those days by horse racing. It was a fair of exhibits. Cows, pigs, chickens, bulls, colts, sheep were entered, and the one in each class decided best by the judges proudly wore the blue ribbon. Fine blooded horses were in demand and attracted unusual interest. The best "gaited" horse—fox trot, pace, single-foot and "rack"—was considered a handsome prize. The best double team, the prettiest two-year-old colt, the finest stallion were the most attractive entries and received the largest purse. The fair was a great stimulant for good stock of all kinds One very interesting feature was the most graceful lady rider. The women brought "crazy" quilts, embroidery, preserves and other homemade articles. There was no public betting and very little private. Rivalry was keen but friendly. Silver cups were offered as prizes. Booths were arranged under the grandstand. Here was fun for the young people.



"Punch and Judy" were in their best days. Pies, candy and cake made another popular booth. No game of chance was allowed. The promoters of the enterprise proudly wore badges, marked in gold letters, "President," "Judge," "Director" and these badges were the "open sesame" to any booth, ring or stable. Brass bands enlivened the time between entries. These fairs were holidays and everybody was out for a good time and most of them had it.

FIFTY YEARS AGO THERE WERE MORE STATESMEN THAN POLITICIANS. Men of brains and integrity could be elected to office despite the fact that they were poor. Fifty years ago the United States Senate did not have a millionaire in its membership. Men were called out and elected. Political campaigns were vigorous but always on a high plane. The rostrum was popular, possessing dignity and courtesy. Great issues were discussed there in open and frank debate. The political boss was not so powerful. Politics were regarded as a science—not degraded to a camouflage to get in and secure the spoils of office. Bribery



and chicanery were reduced to a minimum. Men of vision, men versed in statecraft, men of conviction and towering strength were held in high regard. Money did not play such a prominent part as now. The government was strictly masculine. The leaders of those days builded slowly but their work was solid.

FIFTY YEARS AGO THE SABBATH WAS KEPT HOLY. While in most homes it was regarded as a feast day, the cooking and baking were done on Saturday. Cold suppers were served. The whole family attended church. The men sat on one side of the building; the women and children on the other. The hymns were "lined" out. The congregation was respectful and the minister's sermons were taken as the law and the gospel. The Old Testament was preached from oftener than the New. Revelations were made thrilling. No games of any sort were allowed on the Sabbath. It was a long

and dreary day for the boys and girls. Memorizing Scripture verses was the salient diversion. The boy or girl who could answer the questions in the catechism was regarded as most promising. The old-fashioned "Singing School" would offer an opportunity to get out in the afternoon and it grew popular. The organ was not used. The tuning fork gave the pitch. They "raised" the hymn. Two communities would meet at the schoolhouse and have a singing contest. While many families were Puritanical in their endeavor for a holy Sabbath, yet its observance was a great teacher of reverence for things sacred. Boys and girls looked upon the church service as a time for quiet listening, and while they seldom got anything from the sermon they were taught patience and reverence. And these early lessons lingered in after years. The loss of the old-fashioned Sabbath or Lord's Day is one of the most perilous omens of today.

FIFTY YEARS AGO THE MINISTER PREACHED FROM AN HOUR AND A HALF TO TWO HOURS. He never got through and was never winded. He was not eloquent but he was earnest. He was not logical but he was lurid and loud. It took him twenty minutes to get "warmed up" and then he flung thunderbolts and opened the windows of the Almighty's wrath. And his hearers kept awake and trembled. The

preacher may have been lacking in love and tenderness but was sound in doctrine. He fought sin with both fists. He never compromised; he never put on the soft pedal. He was true to his convictions. The love side of God was covered. Justice, God's Foreknowledge, Predestination and Baptism were favorite themes. The minister preached with unction. He was stronger in dynamite than devotion. He had a "call." He molded sentiment. He indoctrinated his flock. He gave his best and his people were religious.

The teacher was called "Master." While not so polished and progressive as the modern pedagog, he was thorough and patient. The schoolhouse was made of logs and the benches were made of split logs, without backs. The boys and girls were taught their "letters" before they were taught to read. Reading, writing and arithmetic constituted the full line of instruction. When a pupil could spell and pronounce all the words in the old Blue-back spelling book he was spoken of as being "smart." The pupils did not skimp nor cram in those days but learned each leaf thoroughly.

FIFTY YEARS AGO FUNERALS WERE ATTENDED. The number present was not limited to the relatives and close friends. Rank strangers felt an obligation to attend. It was a great occasion for the preacher. The sanctity, silent beauty and nicety of arrangement and tactful comfort of today were wanting in the old-time funeral. Sympathy was given awkwardly but sincerely.

FARAWAY RADIO

$63.50

*Gets Stations Far and near, Loud and clear.*

FARAWAY Radio again to the front. Amazing new set at an exceptional price. Most advanced set on the market today—designed exclusively for the new tubes. Users get stations from New York to Frisco—loud and clear. Operate with either dry cell or storage battery. SATISFACTION GUARANTEED. Don't pay $100 to $150. Write for our money-saving plan and literature.

PATENTS

Time counts in applying for patents. Don't risk delay in protecting your ideas. Send sketch or model for instructions or write for FREE book, "How to Obtain a Patent" and "Record of Invention" form. No charge for information on how to proceed. Communications strictly confidential. Prompt, careful, efficient service. Clarence A. O'Brien, Registered Patent Attorney, 238B, Security Bank Building (directly across street from Patent Office), Washington, D. C.

***The College President from the Middle West*** dropped into The Office. Said he: "There is more wrong with suspicious old heads than with frivolous young ones. Older people always attribute to young people the same type of knowledge that older ones have. They forget the inhibitions, the natural idealisms, the biological protections of youth.

"My college is co-educational. Not long ago the president of a man's college called on me. 'Mac,' said he, 'I'd hate to be responsible for the moral life of these 500 boys and girls you have running around on your campus.' 'Harry,' said I, 'which would you be most afraid of—five hundred men and women of your age and mine, or those youngsters out there.' 'Mac,' said he, 'I'd have more confidence in the youngsters.' "

***The Doctor from India*** dropped into The Office: "Vegetarianism is great in theory, but in India we have little hope for the recovery of a vegetarian stricken with a disease. And if an operation is necessary, the results are nearly always fatal. The vegetarians of India have no resistance, their vitality is low, they become easy victims to any infection. Theoretically it should be the other way around. But any surgeon in India can tell you."

***A Political Reporter from Washington*** dropped into The Office: "Oh, you can hear all sorts of things in the Capital. Third term begins to loom pretty large now. The feeling against it seems to grow. Coolidge is reported to be very desirous of keeping on. Probably he is. And the slogan that this is not a second term but only a first elective term will be worked pretty hard. Some say that the old guard, the representatives of Big Business in the bad old sense, will be friendly to Coolidge until they get all the tax reduction laws that it is possible to get, then they will desert him and go to Hoover. The present fervent attempt at prohibition enforcement is regarded as wholly political. They want to forestall possible Democratic cries of 'We will enforce prohibition' (which they wouldn't) by showing how hard the Republican administration tried to enforce it, and how far they got. Oh, yes, I believe the attempt to get the common bootlegger is honest enough, but if Washington wanted to squeeze it at the source, I think it might be accomplished within a day or two. All this has a head, you know. There are millions in it. Get the source of the millions, the financial interest in bootlegging, and it's all over but the shouting. But be prepared to see some of your best political friends go to jail. That's the rub."

***A Man from Germany*** came into The Office. He had been an American merchant before the war; a member of the German general staff during the war; and is now courageously picking up the threads of his life and trying to find the interpretation of the lesson which the war read to the nations. He was discussing the racial unity of the northern white peoples and asking what had come between us that we had conceived ourselves as enemies. It was a queer trick practiced on our race when we were incensed to fight along national lines. "You must not forget that there are 14,000,000 Anglo-Saxons in Germany," he said. Of course, his idea is correct enough. The idea of race is rising in the world and it is a development to be hailed with joy and hope. It means a wider unity than mankind has ever yet seen. Those who confuse race-awareness with race-prejudice are distinctly the enemies of the world's progress and peace. Good church people are the likeliest to be misled in this matter. God made races; God gave races their work and responsibility; God gave races consciousness of their separate state; you can no more thwart the rising tide of race consciousness than you can legislate against the south wind in the springtime.

"You Americans pride yourselves on two things," said our German, "your colonial architecture and your baseball. Colonial architecture is as old as the Greek. Baseball was played in Germany before America was discovered. Even today in every town and village of Germany the boys play *ball-lauf*, which is in principle your baseball. We also have a game called *klot*, of very ancient origin, which is a combination of curling and golf. It consists in hurling flat rounded stones over the ice, from town to town, sometimes for a distance of 40 miles. The player who covers the 40-mile ice course in the fewest strokes wins the game. It is some game that can combine those two and stretch them out over forty miles. Yet you can tell a good deal from the similarity of sports among the peoples."

# The Seven Poor Travellers

(*Continued from page 7*)

THE BEEF.

Man with Tray on his head, containing Vegetables and Sundries.

Volunteer Hostler from Hotel, grinning, And rendering no assistance.

As we passed along the High-street, comet-like, we left a long tail of fragrance behind us which caused the public to stop, sniffing in wonder. We had previously left at the corner of the innyard a wall-eyed young man connected with the Fly department, and well accustomed to the sound of a railway whistle which Ben always carries in his pocket, whose instructions were, so soon as he should hear the whistle blown to dash into the kitchen, seize the hot plum-pudding and mince-pies, and speed with them to Watt's Charity, where they would be received by the sauce-female, who would be provided with brandy in a blue state of combustion.

All these arrangements were executed in the most exact and punctual manner. I never saw a finer turkey, finer beef, or greater prodigality of sauce and gravy; and my Travellers did wonderful justice to everything set before them. It made my heart rejoice to observe how their wind and frost hardened faces softened in the clatter of plates and knives and forks, and mellowed in the fire and supper heat. While their hats and caps and wrappers, hanging up, a few small bundles on the ground in a corner, and in another corner three or four old walking-sticks, worn down at the end to mere fringe, linked this snug interior with the bleak outside in a golden chain.

When supper was done, and my brown beauty had been elevated on the table, there was a general requisition to me to "take the corner"; which suggested to me comfortably enough how much my friends here made of a fire—for when had *I* ever thought so highly of the corner, since the days when I connected it with Jack Horner? However, as I declined, Ben, whose touch on all convivial instruments is perfect, drew the table apart, and instructing my Travellers to open right and left on either side of me, and form round the fire, closed up the centre with myself and my chair, and preserved the order we had kept at table. He had already, in a tranquil manner, boxed the ears of the inattentive boys until they had been by imperceptible degrees boxed out of the room; and he now rapidly skirmished the sauce-female into the High-street, disappeared, and softly closed the door.

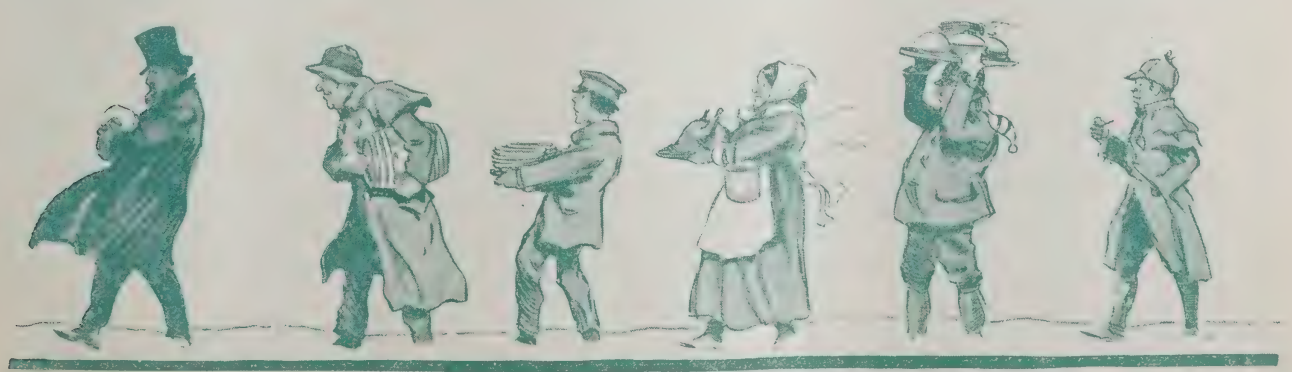
This was the time for bringing the poker to bear on the billet of wood. I tapped it three times, like an enchanted talisman, and a brilliant host of merry-makers burst out of it, and sported off by the chimney—rushing up the middle in a fiery country dance, and never coming down again. Meanwhile, by their sparkling light, which threw our lamp into the shade, I filled the glasses, and gave my Travellers, CHRISTMAS! — CHRISTMAS-EVE, my friends, when the shepherds, who were Poor Travellers, too, in their way, heard the Angels sing, "On earth, peace. Good-will towards men!"

I don't know who was the first among us to think that we ought to take hands as we sat, in deference to the toast, or whether any one of us anticipated the others, but at any rate we all did it. We then drank to the memory of the good Master Richard Watts. And I wish his Ghost may never have had worse usage under that roof than it had from us.

It was the witching time for Story-telling. "Our whole life, Travellers," said I, "is a story more or less intelligible—generally less; but we shall read it by a clearer light when it is ended. I, for one, am so divided this night between fact and fiction, that I scarce know which is which. Shall I beguile the time by telling you a story?"

They all answered, yes. I had little to tell them, but I was bound by my own proposal. Therefore, after looking for awhile at the spiral column of smoke wreathing up from my brown beauty, through which I could have almost sworn I saw the effigy of Master Richard Watts less startled than usual, I fired away.

* * * *



My story being finished, and the Wassail too, we broke up as the Cathedral bell struck Twelve. I did not take leave of my travellers that night; for it had come into my head to reappear, in conjunction with some hot coffee, at seven in the morning.

As I passed along the High-street, I heard the Waits at a distance, and struck off to find them. They were playing near one of the old gates of the City, at the corner of a wonderfully quaint row of red-brick tenements, which the clarionet obligingly informed me were inhabited by the Minor-Canons. They had odd little porches over the doors, like sounding-boards over old pulpits; and I thought I should like to see one of the Minor-Canons come out upon his top step, and favour us with a Christmas discourse about the poor scholars of Rochester; taking for his text the words of his Master relative to the devouring of Widows' houses.

The clarionet was so communicative, and my inclinations were (as they generally are) of so vagabond a tendency, that I accompanied the Waits across an open green called the Vines, and assisted—in the French sense—at the performance of two waltzes, two polkas, and three Irish melodies, before I thought of my inn any more. However, I returned to it then, and found a fiddle in the kitchen, and Ben, the wall-eyed young man, and two chambermaids, circling the great deal table with the utmost animation.

I had a very bad night. It cannot have been owing to the turkey or the beef,—and the Wassail is out of the question,—but in every endeavour that I made to get to sleep I failed most dismally. I was never asleep; and in whatsoever direction my mind rambled, the effigy of Master Richard Watts perpetually embarrassed it.

In a word, I only got out of the worshipful Master Watt's way by getting out of bed in the dark at six o'clock, and tumbling, as my custom is, into all the cold water that could be accumulated for the purpose. The outer air was dull and cold enough in the street, when I came down there; and the one candle in our supper-room at Watt's Charity looked as pale in the burning as if it had had a bad night too. But my

Travellers had all slept soundly, and they took to the hot coffee and the piles of bread-and-butter, which Ben had arranged.

While it was yet scarcely daylight, we all came out into the street together, and there shook hands. The widow took the little sailor towards Chatham, where he was to find a steamboat for Sheerness; the lawyer, with an extremely knowing look, went his own way, without committing himself by announcing his intentions; two more struck off by the cathedral and old castle for Maidstone; and the book-pedlar accompanied me over the bridge. As for me, I was going to walk by Cobham Woods, as far upon my way to London as I fancied.

When I came to the stile and foot-path by which I was to diverge from the main road, I bade farewell to my last remaining poor Traveller, and pursued my way alone.

Going through the woods, the softness of my tread upon the mossy ground and among the brown leaves enhanced the Christmas sacredness by which I felt surrounded. As the whitened stems environed me, I thought how the Founder of the time had never raised his benignant hand, save to bless and heal, except in the case of one unconscious tree. By Cobham Hall, I came to the village, and the churchyard where the dead had been quietly buried, "in the sure and certain hope" which Christmas-time inspired. What children could I see at play, and not be loving of, recalling who had loved them! No garden that I passed was out of unison with the day, for I remembered that the tomb was in a garden, and that "she, supposing him to be the gardener," had said, "Sir, if thou have borne him hence, tell me where thou hast laid him, and I will take him away." In time, the distant river with the ships came full in view, and with it pictures of the poor fishermen, mending their nets, who arose and followed him,—of the teaching of the people from a ship pushed off a little way from shore, by reason of the multitude,—of a majestic figure walking on the water, in the loneliness of night. My very shadow on the ground was eloquent of Christmas; for did not the people lay their sick where the mere shadows of the men who had heard and seen him might fall as they passed along?

Thus Christmas begirt me, far and near, until I had come to Blackheath, and had walked down the long vista of gnarled old trees in Greenwich Park, and was being steam-rattled through the mists now closing in once more, towards the lights of London. Brightly they shone, but not so brightly as my own fire, and the brighter faces around it, when we came together to celebrate the day. And there I told of worthy Master Richard Watts, and of my supper with the Six Poor Travellers who were neither Rogues nor Proctors, and from that hour to this I have never seen one of them again.

# He Plays Santa Claus the Whole Year Round

YOUNG folk who doubt the existence of a Santa Claus should see Carl Herrman Braatz, of Washington, D. C. He is 77 years of age, stands about six feet tall, and has a long, flowing natural white beard and a red face. In the rôle of Santa Claus, which he plays each Christmas at one of the large Washington department stores, he wears a red velvet suit, trimmed in white fur, and high black boots. A bald spot on his head is covered with a red velvet skull-cap. A jolly laugh and a German accent further contribute to the personage which he so realistically typifies.

Carl Herrman Braatz.

"I feel that I was born to be Santa Claus to old and young," he told this writer as he recounted that it was five years ago that he was first employed by a Washington department store to act the part. Since that time he has shaken hands with more children than any person in the National Capital.

Santa Claus, as it symbolizes a spirit of giving and service, is not seasonal with Carl Herrman Braatz. He believes, true to the Biblical text, that it is more blessed to give than to receive—365 days to the year. This accepted truism finds real expression in his method of giving to needy and deserving persons at least one dollar every day—a practice which he will continue the remainder of his life. He is largely the owner of Central Mission, headquarters of a charitable organization in Washington. This is a refuge for the poor, the needy, and others sharing little of this world's goods.

Fortunate, is it not, that this giver of gifts is the recipient of a legacy? This was bequeathed him before he was either an honest-to-goodness Santa Claus or the head of a charitable organization, but the donor of this lifetime legacy must have had an intuition that Carl Braatz was destined to play the part well. No less a distinguished personage than the American historian, the late George Bancroft, who as former Secretary of the Navy established the Naval Academy at Annapolis, upon his death in 1891, bequeathed to the subject of this sketch one dollar a day for lifetime. This is how he is enabled to act as Santa Claus 365 days to the year to old and young, and is not merely a bewhiskered St. Nicholas who plays the part during the brief festive season.

# Points of Progress in Dewey's Life

AFTER the father of George Dewey had obtained permission for his son to fill a vacancy at the Naval Academy at Annapolis, he said to his son:

"George, I have done all I can for you. The rest you must do for yourself."

Young Dewey was put to the test in the Battle of New Orleans. He tells of his baptism under fire:

"I took up my post on the hurricane deck of the *Mississippi*, under Captain Smith. The Confederate ram *Manassas* pointed its nose toward the *Mississippi*. Captain Smith steamed alongside the gunboat, which he had mistaken at first sight for the *Cayugua*, flagship of our Captain Bagley.

" 'I want permission to run down the ram,' he called.

"Just then we saw our error! The *Hartford* came steaming by. Admiral Farragut was in her rigging, his face eager with victory, in the morning light.

" 'Run down the ram!' he called."

In that moment, when he saw Farragut, Dewey resolved to become as great an admiral. With the declaration of war between Spain and the United States, came the great opportunity.

Manila Bay had been mined by the Spanish, with the expectation that it would keep out the American fleet. But Dewey recalled Farragut's old words, "Damn the torpedoes; full steam ahead."

Dewey's dash into Manila Bay over the exploding torpedoes electrified the world. His calm command that May morning, 1898, to the captain of the *Olympia*, "Fire when you are ready, Gridley," is famous, and the name of George Dewey has been placed on the roster of great admirals of the world.

—*F. D. H.*

# What Happened to a Dream

"But why be lonely, at that? There are quite a number of things to do if we could only think of them—."

(*Concluded from page 3*)

and send them off on their daily journey with words of caution ringing in their ears and with correct principles of conduct blazing before their eyes. Of course, each of us knows the correct principles of conduct. That is one of the blessed bits of wisdom that come with parenthood. At any rate, we can tell them something, and we should do so. Tell them the best we know.

Children are better off outside the house than inside because children are like their elders, only more so. We all learn from each other but children have more to learn because they know so little of the world into which they have so recently been flung. And one of the things that we soon learn is that when a companion can teach us no more we soon tire of him. We do not know why we tire, but that is the reason. So long as we continue to learn we continue to like. We find the other fellow interesting so long as he has a new way of putting things and a way of seeing things from a different angle. When we know him so well that he no longer surprises us with new squints at things, we say he is stupid—or at any rate, we drop him without knowing why. The evolutionary process seems always to be driving us toward those with whom we may exchange ideas to our mutual profit, and to cut the connection when there is nothing more to be gained. That is why the young who are by nature so eager to learn make friends so easily, as it is also why those who are too old to learn become hard boiled, shut themselves up at night with their radios and hope to heaven that nobody will ring the doorbell. You may not think the young are eager to learn. The way they talk about their school would seem to indicate the contrary. But the young are very eager to learn and the books they like best are human beings of their own age who are traveling the same road with themselves and can tell them about the shows in the other two rings of the circus while they are looking at the performance in the third ring.

It is often said that the young of today are in an exceedingly dangerous position because of the bootlegging and boozing. I don't believe it. I have heard all about the drinking around high schools at school dances and elsewhere, all of which is unquestionably bad. But I still have some recollections of my own boyhood. I lived in a town that, by local option, was dry But three miles away was one that was very wet. I was taught to have a horror of drinking, but chums of mine used to have a habit of getting over to the wet town.

The dangers from drink, so far as the young are concerned, did not all begin with prohibition.

Oh, the children who are leaving us alone at home at night will get along all right, and when their children leave them, they will not mind it because it will be only what they did before them. But we who have our pictures of the past and the ashes of what were hopes of fireside joys—there is not so much hope for us. We cannot be reconciled by an explanation, nor can our heartstrings be painlessly severed by realization of the fact that even our fifteen-year-old children do not need us very much.

But why be lonely, at that? There are quite a number of things to do if we we could only think of them. I doubt very much whether it is a good thing for parents to form the habit of sitting around the house during the evening so much. It is a fine way to grow old fast. Maybe our children are really doing us a service by giving the old fireplace absent treatment. Perhaps we shall be compelled to go back to the ways of our youth and resume some of our connections with the outside world.

## The Yule Log

THE Yule Log played a prominent part in the early festivities at Christmas time. Steam heat in the modern apartments robs the living generation generally of the pleasant custom of having a log and a cheery fireplace. In olden days a whole family (as in Provence) would make it a custom to go out on Christmas Eve and fetch in a log, the while they walked in line according to seniority and sang a carol. One of the children—the youngest—would pour wine on the log just before throwing it on the fire. Prior to the French Revolution, it was customary in Normandy to have the prettiest girl present sit on the log, while the others in the party drank to her health. Occasionally a figure of a human being was outlined in chalk on the log, which was reminiscent of the heathen practice of offering human sacrifices to the fire. Nearly every household which had a yule log made sure to save a brand with which to light the new log on the next Christmas.

# Christmas With the Pennsylvania Dutch

(*Concluded from page 15*)

Bessie hallooed outside and we visited Uncle John who lived at the far end of Main street.

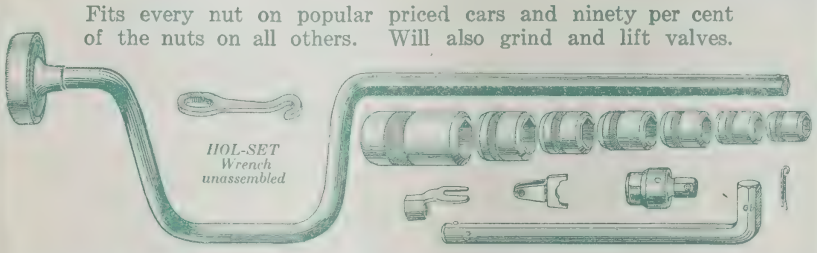
On the way back, we just must stop for a few minutes to see Cousin Clara. There, as at Uncle John's, we were served many kinds of cake and candies. Former puzzles began to clear up.

There had been such talk as: "For my cookies, I use two pounds of butter, so many pounds of sugar, and so on." Why pounds and pounds, I had thought, mystified. Are they making cake for the church fair? Surely *pounds* of butter and sugar must make enormous quantities. As a matter of fact, they do.

They make huge crocks of cookies, great pound cakes, and many fruit cakes to last through the Christmas season, when everybody visits and returns visits. Christmas here was not only a day but a *season* as well.

Every home we visited was scented by the pungent, Christmassy odor of evergreen, and brightened by a glittering tree. No Christmas tree in that region was complete unless at its very tip was a guardian angel and a star.

And last of all, late in the afternoon, we came to Uncle Hiram's. Uncle Hiram had married a Dunkard or Mennonite. She was a perfectly lovely little woman. As we walked home they told me something of this sect. I had never heard of them. The women wear brown dresses and bonnets. They do not wear any jewelry or ornaments except a white kerchief and cuffs. They always wear a white cap, which is called "The Power." The men wear large-brimmed hats and long frock coats.



In the autumn they have a Love Feast. Great tables are set on a lawn and snitz pies (made of dried apples), apple butter, coffee or cider are served to any one who cares to drop in. Throngs of curiosity seekers visit this feast. The food is excellent, the hospitality sincere and simple, and many who "come to scoff remain to pray."

I am not quite sure on this point, but I think it is at the opening of this feast that the men greet each other with the Holy Kiss, and have the ceremony of feet washing. There were many of them in the village. They were very quiet and peace-loving, but strenuously objected to progress of any kind.

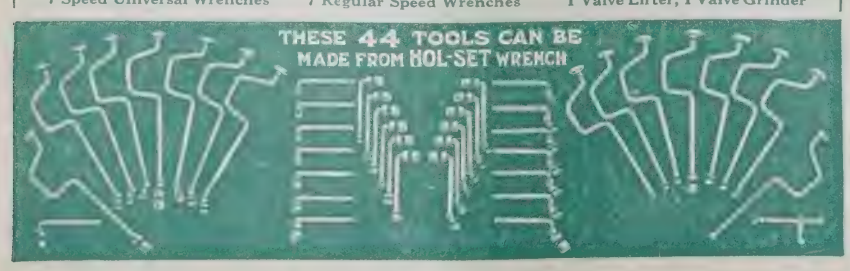
I feel sure that not a person in the village was forgotten that Christmas, or indeed at any other time. For myself, my first Christmas away from home had been turned by the magic of old-fashioned neighborliness into a lifelong memory of joy.

## A Husky Tool
**for Mechanic or Car Owner**

Fits every nut on popular priced cars and ninety per cent of the nuts on all others. Will also grind and lift valves.

**The HOL-SET WHOLE SET Wrench** Retails for $3.75

**44 Complete Tools in 1**



Hol-Set Wrench assembled for Tool Box.

Fully guaranteed against breakage. Built to stand hard usage of mechanic or car owner. For sale by jobbers and dealers everywhere, or write direct.

**HOL-SET Mfg. Corp., 81 Mt. Hope Avenue, Rochester, N.Y.**

1 Valve Lifter, 1 Valve Grinder

## Valuable Old American Bottles

(*Concluded from page 14*)

in ancient Egyptian treasures for the ultimate in beautiful bottles. He will hear of or find such old specimens as the "tear bottle," so called because it was used to receive the tears which fell from mourners' eyes as they gathered for the last rites around Egyptians' tombs. One of these buried about 3000 B. C., has replicas in several museums. When found, such old bottles invariably emit the sweetest and most delightful odors imaginable when uncorked, and once again the seeker is carried away on time's wings to incense-filled situations, suggestive of fields and forests, hills and valleys where the sweetest scented flowers of all time were wont to flourish and bloom.

Can any avenue to the past be more pleasant for traveling than that which is strewn with old bottles? With its many crooks and bends and gaps, through stately parlors and magnificent boudoirs, past the mellow, smoke-stained taprooms of old inns and public houses, into sturdy old medieval castles and out upon the broad highway of antiquity—well, it might be interesting to keep one's eye out for unique shapes and colors in the products of bottle-making glassblowers!

"Presently you discovered it was Jess Carpenter."

# Do You Remember Christmas on the Farm?

By HOMER CROY

DO YOU remember how lonesome and dreary and monotonous Christmas used to be on the farm? But Christmas on the farm is getting more and more exciting.

In those old days the most exciting event of the winter occurred when the old rooster froze his feet. Do you remember how he limped and clodhopped around, how his comb got red and swollen? When spring came, still he couldn't walk well, and he would scratch those scaly, puffy feet, with the whitish-yellow nails, in the ground, flop his wings and go *clawk-clawk-clawk*!

Oh, it was a big event when the rooster froze his feet!

Do you remember the long winter evenings we used to have on the farm when nobody ever came and nobody ever went anywhere? But how about it nowadays? Do the farmers stay at home? Only when they are snowed in. They keep the old car so much on the go that they don't have to put in alcohol until Christmas.

About the only excitement, during those long winter evenings, was reading the patent medicine almanacs and wondering which diseases you had.

When you started in to read you would be feeling perfectly well, but pretty soon you would notice a slight headache. You would notice a ringing in your ears and shortly there would be darting things before your eyes, just as described in the book. The tongue, the book said, in such cases was usually coated, and then you would creep over to the mirror—and sure enough your tongue would be as gray as a rabbit's tail.

You were in the advanced stages of that terrible disease, whatever it was. You would feel weak in the knees and your hands would shake more than ever. By chance, your eye would fall on palsy and you would begin to read about that. Palsy, it said, was an affliction usually confined to people in their old age, but there were cases on record when it had fastened on young people—and then you knew that you had it; you were an exception.

Or maybe it would be palpitation of the heart. You had gone for years hardly knowing that you had a heart, except when you ran too fast, or something that way, and then you would begin to count your pulse. Jumping Jerusalem!—you had heart trouble! By this time your heart was racing like a threshing machine flywheel with the belt off. It must be going two hundred a minute. And then you would make up your mind that if you pulled through the night you would never, never be bad again as long as you lived.

Never again would you complain about carrying in wood for the stove, or feeding the calves, and when you milked Old Red again you wouldn't squirt milk on the cat, nor get your mother's maple sugar candy which she kept on a shelf in the pantry to give to the children after they had to take medicine—no, indeed. Pretty soon you would be sleepy and go stumbling off to bed and say the longest prayers you had said in months. In a few minutes you would be asleep and the next day there would be a little angel in pants running around that house. But in a week you would be back to normal again.

That was the way we lived on a farm in those days—getting all worked up over nothing. If it hadn't been for the patent medicine books, I don't know what we would have done for excitement.

"There was always a little boy to recite."

Do you remember how Christmas used to come?—not all of a jump the way it does now. It seemed to hold back as long as it could. Sometimes you would think it would *never* come.

Along in the autumn, your father would say, "Well, I guess we had better put up a couple of shoats and fatten 'em so as to have some spareribs for Christmas."

That was the first mention of it. How good it

sounded! It seemed as if it had been ages since last Christmas, but now it was actually coming again!

One day at dinner your mother said, "I think I ll turn in and bake a fruit cake this afternoon and let it season. It'll be good and tasty along about Christmas time."

There it was again, Christmas. Fruit cake this time. *Ummmm-ummm!*

You wouldn't hear any more about Christmas until one Sunday at church the Sunday school superintendent would clear his throat and say, "Brethren, it is time for us to begin to think about Christmas. It will soon be upon us. We must all work together and get a tree and some candy for the Sunday school scholars." He always called the Sunday school students *scholars*.

How Sunday school attendance picked up after that! Wasn't it a remarkable coincidence, how along about this time of the year, attendance climbed sky high?

For a day or two you would be excited about Christmas and then you would sort of forget it, and then one evening as you passed the church, the church would be all lighted up and you would wonder what it was, because it wasn't Wednesday night, and then you would hear the singing—why, they were practicing the Christmas program. And then you would gallop home like a colt let out of a stable on a frosty morning.

And then the first thing you knew your mother would be going through the Sunday school papers and books to find a nice piece for your sister to speak. It was a little closer now.

You began to think about presents and to hint to your parents about them. You said, "Of course, I don't know what I am going to get this year, but I'd like to have a pair of skates. All the fellers have them except me." Children didn't get so many presents in those days. But, for all I can see, the children were just as happy with their few presents as the children are today with the bundles and oodles of them.

*When Santa Claus Failed to Fool You*

You'd keep on hinting, but nobody seemed to pay any attention. At last you would think that you weren't going to get any at all. As Christmas approached, you grew more anxious, especially when your father said, "Well, I guess it's going to be a poor man's Christmas for us this year, because the crops have been mighty bad."

Of course, your father, being a farmer, always thought crops were bad.

One Saturday your father and mother went to town and when they came back they had a lot of crinkly packages. Your mother hid them under the lap robe and carried them to the house. Up to that time no package the size of a pea could have come into the house without your wanting to open it and see what it was, but now they could have brought in a stuffed elephant and left it in the middle of the floor and you would have pretended that you didn't see it. You might be a gorilla all summer, but when December came a pair of wings began to sprout.

The last day of school came, with recitations, as you called them, "readings," as they call them now, though they don't *read* anything at all.

The teacher said, "Now, children, you may put your books away for the day."

I wish I had space to tell about those recitations and speeches. There was always a little boy to recite. How his heart went pitty-pat when he stepped out on the stage for the first time until he heard somebody say, "I wonder what little fool is that." It just wouldn't have been Christmas if somebody didn't recite the pitty-pat poem. Or the poem, "Jes' Before Christmas I'm as Good as Good Kin Be." Or maybe "Bingen on the Rhine."

The teacher would make a little speech and tell what good children you had been all year, when not two weeks before she had pretty nearly licked the whey out of one of the students and a whole lot of you had been kept in, but now nobody could tell it the way the teacher talked. Oh, everybody was just as good as apple pie.

There would be a noise at the door and a man would come in carrying a basket, candy, licorice, gumdrops!

All the world seemed wonderful and everybody was good. Of course, it was the same old crowd you had seen all your life.

With Christmas Eve at the church came speaking and singing and noise and excitement. Santa Claus appeared all of a sudden. Some of the youngsters who didn't know anything thought it was really Santa Claus, but he didn't fool *you*. Presently you detected that it was Jess Carpenter who lived down the road a couple of miles. It was a shock at first to find that it was only old Jess, but still he had lots of presents.

Did it happen in your church? It happened in our church when I was a boy—that awful, blighting catastrophe which used to come so often on Christmas Eve. The cotton on the Christmas tree caught fire. I shudder now as I think of it. They don't have cotton on Christmas trees any more, and I am glad. That was a dangerous practice, and brought a terrible, blighting Christmas into many a home.

Few persons had Christmas trees in the home in those days, unless they lived near the timber where they could get the right kind of trees easily. This was before trees were shipped in from long distances. We hung up merely our Christmas stockings, around the stove and on the backs of chairs. Usually you wanted to sit up late, but tonight you went to bed like a shot. Burglars could have broken in and pulled off the wall paper and you wouldn't have heard them. No, indeed, not tonight.

*But Now Things Are Quite Different*

At last, CHRISTMAS itself. There were the stockings hanging in the same place but suffering from elephantitis—candy, books, toys, and more candy. Do you remember how you went flying around from one present to another? And eating with both hands?

But now things are different on a farm. The old, lonesome, shut-in Christmas is gone. It's no more lonesome on a farm now than it is in the city, because of the telephone, the radio, the automobile, and so on. The farmer isn't isolated any more. He can now whirl in to town in the time it used to take him to go out and catch the horses and hitch up.

# Cup No.3

## No harm can come if it's coffee without caffeine

Now all your people can drink coffee to their hearts' content. Children can enjoy it. All who are driven to coffee substitutes can have real coffee now, and all they want. People whom coffee keeps awake can drink it at midnight and sleep.

Science has found a way to remove caffeine from coffee. That is the poison drug. Yet every coffee delight remains.

This new-type coffee is called Kaffee Hag. The finest hotels now serve it, because of its delightful blend. Countless connoisseurs have adopted it, just because it typifies the utmost in fine coffee.

We simply open the pores of the raw coffee bean and extract the caffeine. That is a tasteless drug. Expert tasters cannot tell when we remove it.

All the quick bracing effects remain. The caffeine stimulation does not come until two hours after drinking, so nobody misses that.

Consider what that means. A delicious coffee which no doctor will forbid. No effect on the heart, nerves or kidneys, no wakefulness. No reason why children may not enjoy it. No reason at all for a substitute.

If you think someone in your home would enjoy such a coffee, let us supply a ten-cup test. Mail coupon now, with a dime (or stamps).

**Mail This Today for 10-Cup Sample; 10 cts.!**

# You can finish any surface with Lacq

You can finish stairways, floors of wood or concrete with Lacq and walk on them in less than one-half hour.

You can finish chairs, tables, desks, dressers, bedsteads or any pieces of furniture with Lacq and use them in less than one-half hour.

Finish kitchen cupboards, built-in china cabinets, bookcases, grillwork, or woodwork in any room—you won't have to wait for Lacq to dry.

## HOUSEHOLD LACQUEROID

## and use it in less than one half hour

This wonderful brushing lacqueroid, a newly discovered type of household finish, not only dries more quickly than any finish you have ever used, but it produces a wear-resisting surface that withstands the action of steam, water and acids. Its rich, lustrous surface will add the greatest beauty to furniture, floors and woodwork.

To Dealers: Lacq offers you an exceptional opportunity to serve your customers. Write for the "Story of Lacq"—address any one of the licensed distributors listed here.

There is only one Lacq—there is no substitute

The GLIDDEN Companies

PAINTS — VARNISHES — LACQUERS — ENAMELS

The splendid staff of our Research Laboratories has always kept us in the forefront of progress. They developed our Lacqueroid System for motor cars—a system in use by leading automobile manufacturers, and now they have discovered Lacq, a brushing lacqueroid that revolutionizes household finishing.

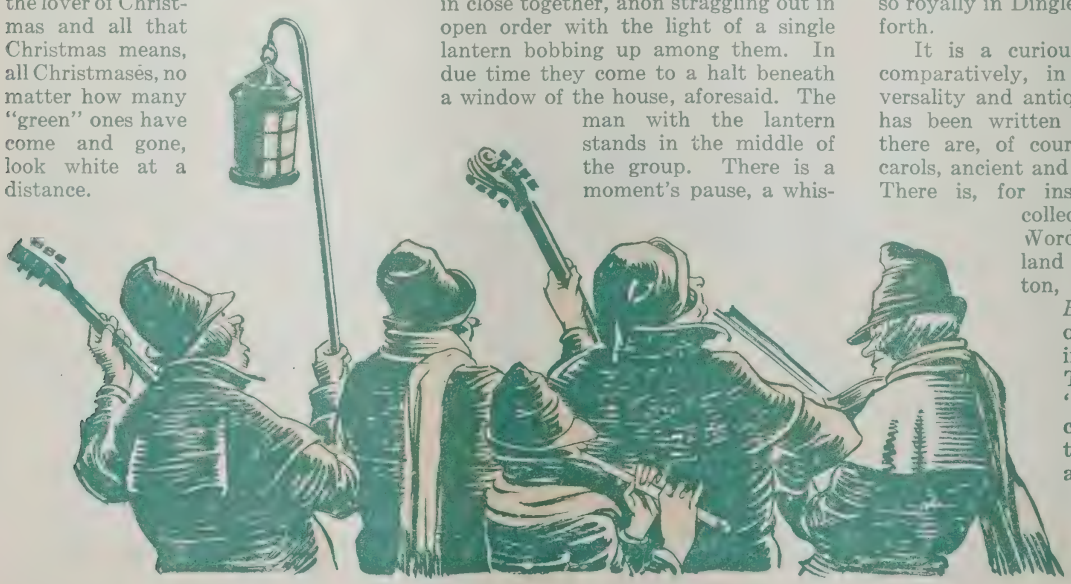
# Christmas Carols

By HUGH A. STUDDERT KENNEDY

SOME years ago, some individual set out to show that the "real old-fashioned Christmas," the weather of it, at any rate, was not so old-fashioned after all. With an air of almost indecent academic detachment this man laid vandal hands on a most cherished picture, the memorable Christmas spent by the Pickwickians at Dingly Dell. He had, he said, consulted *Howard's Climate of London*, and, as a result, had discovered that in the year 1830, the year of the Pickwickian party, the weather about Christmas time was, day by day, as Dickens in his memorable narrative described it. There was hard frost on the twenty-fourth, hard frost on the twenty-fifth, hard frost again on the twenty-sixth, with snow on Christmas Eve.

Now, if he had left the matter there all would have been well. But he went on to show that immediately after Boxing Day—as the day after Christmas is called in England—the weather grew milder, and he concluded with the remark that, after all, the real old-fashioned Christmas was just a cold snap such as might occur at any time during an English winter.



Well, it was a thankless task. Like all other wreckers of cherished traditions, he convinced nobody. Dickens' books alone, to say nothing of Thackeray or Washington Irving, were too much for him. To the lover of Christmas and all that Christmas means, all Christmases, no matter how many "green" ones have come and gone, look white at a distance.

It is the same, of course, with Christmas carols; they have only one setting. Within, the candles must be burning brightly, the fire of logs crackling on the hearth, sending its warm glow into the farthest corner of an old-fashioned room in an old-fashioned house, and without snow, of course, or at any rate hard frost, with the road between the silent hedgerows "compact and dry as a solid block of marble" glistening in the moonlight.

Along this road come the carol singers, a gay little party now bunching in close together, anon straggling out in open order with the light of a single lantern bobbing up among them. In due time they come to a halt beneath a window of the house, aforesaid. The man with the lantern stands in the middle of the group. There is a moment's pause, a whisper or two of instruction, and then, very softly the carol begins. It does not very much matter what it is, the famous "Cherry Tree Carol" or "I Saw Three Ships Come Sailing By," or

"God rest you, merry gentlemen,
Let nothing you dismay,"

or something more modern. It always seems to begin softly, and to break upon the ear with a gratefulness all its own. So, at the first notes, the shades of the old-fashioned window in the old-fashioned house are thrown up, the curtains are drawn aside, and just such a party as entertained Mr. Pickwick so royally in Dingley Dell peers eagerly forth.

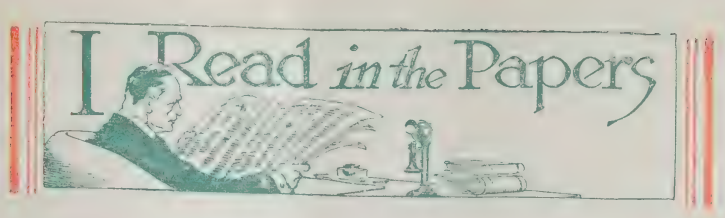
It is a curious thing how little, comparatively, in spite of the universality and antiquity of the custom, has been written about it, although there are, of course, many books of carols, ancient and modern, to be had. There is, for instance, the famous collection of Wynkyn de Worde, printed in England in 1521; while Warton, in his *History of English Poetry*, tells of a license granted, in 1562, to one John Tysdale for printing "Certayne goodly carowles to be song to the glory of God"; and again he speaks of "Crestenmas carowles auctorisshed by my Lord of London."

It was, indeed, in these years, when the spirit of the Reformation was sinking deep in the hearts of the English people, that Christmas caroling in England seems to have come specially into its own. So much so that, in spite of the onset of a civil war, one William Slayter was constrained to gather a collection "of the songs of Sion, intended for Christmas carols, and fitted to divers of the most noted and common but solemn tunes, everywhere in this land familiarly used and known."

So, every year as Christmas came around, whether it was a king or a protector that reigned in London, the "carowle singers" would go forth. Thus it has been ever since, and so it is today. Costumes have changed. The horn lanthorn gave way, long ago, to the storm lamp, and the storm lamp, in these days, may occasionally be superseded by the electric torch, yet the general circumstances of the real carol singing are forever the same—Irving's full moon and clear sky, his bare trees, his "thin, transparent vapor stealing up from the low grounds."

Of course, there is carol singing and carol singing. We have always had a strange fellow feeling for Scrooge in the stern attitude he adopted toward the youthful Saint Dunstan who sought to regale him with a Christmas carol through the keyhole. Yet it is curious how indifferent an effort will be acceptable. For the Christmas carol is essentially a folk song, and one of the joys of folk songs is that the folk can sing them, and the nice adjustment of parts is of little consequence. In the little party which fares forth into the moonlight to "go the rounds" there will always be a tenor or two who can sing tenor, always a bass or two who can sing bass, and there will always be a lady or two who can sing "seconds." For the rest they sing the tune

"Good King Wenceslas looked out,
On the feast of Stephen,
When the snow lay round about,
Deep and crisp and even."

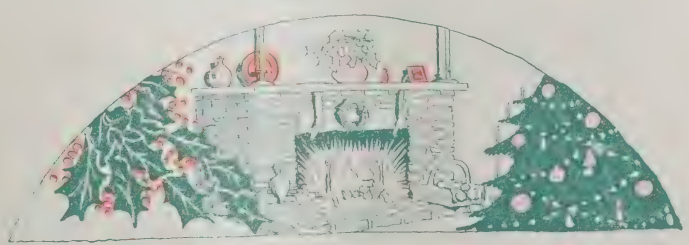


Only I was convinced, for many years, that the name of the king was "Wence," and that the tragedy of the thing lay in the fact that it was his "last look out."

## "Wassail! Wassail! Wassail!"

THE ancient custom of Wassailing was always an indispensable factor in the celebration attendant to the old-time Christmas, New Year's and Twelfth Night.

"Wassail"—"your health"—was the Anglo-Saxon drinking pledge, taken with the Wassail Bowl, containing a concoction called "lambs' wool," made of ale, apples, sugar and spices.



Because of the fruit they bore, it was customary on Christmas Eve to Wassail the most fruitful trees in the orchards. Celebrants gave their toast and dipped a branch in their jar of cider. Generally there was shouting, kettle beating and firing of guns.

***I read in the papers*** that *Money Musk* is being revived among other old tunes for the new old dances. The title of this tune has puzzled many. The relation between money and musk has defied their sense of interpretation. But the title has really nothing to do either with money or musk. The first syllable is pronounced "mon" not "mun." Moneymusk is the name of an obscure but very beautiful village on the banks of the river Don in Aberdeenshire, Scotland. Although small, the place is of ancient origin, and a few centuries ago was an ecclesiastical center of considerable importance. Sir Arthur Grant is the laird of Moneymusk. Later it became a gathering place where lads and lasses from the neighboring hills and glens danced reels and strathspeys. When a new dance tune was inspired on the spot *Moneymusk* became its name. The place is still a great dancing center.

***I read in the papers*** that the *China Weekly Review*, of Shanghai, writes with hot indignation on the subject of Chinese changing names. It makes interesting reading. We quote in part: "There is time to consider whether Chinese have any 'business' taking a 'foreign' or 'Christian' name. The gentleman, if such he is, who started the ball rolling betrays considerable irritation and waxes sarcastic over the fact that some Chinese assume names which most foreigners find it easier to remember than are the ordinary Chinese names. Mr. 'Joseph' Wong and Mr. 'Alexander' Hsiao are quite shocking to the one who started the correspondence, and the latter preens himself in rather a nasty way by ending his diatribe with the assertion of gratitude to Heaven that as yet no Chinese has been born who can wear a *pince-nez!* —Though why on earth any one should want to wear a *pince-nez* is more than many esthetically minded persons could explain. Moreover the writer showed his lack of acquaintance with the legal fraternity of this cosmopolitan settlement in making the last quoted statement, inasmuch as one distinguished Chinese lawyer—a graduate of an English University, by the way—does wear a *pince-nez*, and wears it as becomingly as a *pince-nez can* be worn! . . . There was a day in England and in America when a certain picturesqueness of names was common. The Puritans may have been drab in color of clothes and harsh in manner as Mr. James Truslow Adams claims, but who that comes across such names as Praisegod Barebones or Increase Mather can fail to rejoice that these people existed? Drab and colorless they may have been, commonplace they certainly were not. But returning to China, consider how much is to be gained by the Western student of history from the taking of a Western name by so distinguished a diplomat as Dr. Wellington Koo. To an English or American schoolboy, Koo V-kyuin would be unpronounceable and unrememberable, but Wellington Koo is widely known and easily remembered—and it is not difficult for the student and ubiquitous 'man on the street' to know that Mr. Wellington Koo's family name is Koo and not Wellington. Is that not worth a good deal? We should say it is—to Mr. Koo, at least."

***I read in the papers*** that all the time people are getting fatter and fatter, not only men, but women, especially women. In Morocco, and in certain parts of the interior of Africa, obesity is the hall mark of feminine beauty, and in his veracious history of New York, Washington Irving tells us that it was formerly the custom for the mayor and aldermen to be chosen by weight. But America is not Africa, and modern New York is a very different place from New Amsterdam; and still there are so many fat people that one would think there were special prizes to be won in this direction. However, the opposite seems to be the case. Most people are not really anxious to get fat, and this is why beauty experts and nostrum manufacturers are reaping a rich harvest. To an impartial mind there is but one conclusion: People of the present day eat too much and exercise too little.

# How Christmas Is Kept in Every Land

## There Is Universal Good Cheer, But Not Always Boars' Heads and Blazing Yule Logs

By HORACE WYNDHAM

THERE is a theory that Christmas was "invented" by Charles Dickens.

Well, even the crustiest of curmudgeons will admit that it was a very good thing to have "invented."

Despite the increasing materialism of the age, Christmas still has its customs and traditions. Things alter, but the spirit of the festival is eternal. A Puritan Parliament tried hard to suppress it. The attempt, however, was an ignominious failure.

In the matter of celebrating Christmas, different countries have their own special customs. Yet, they all seem to have one custom in common. This is that in which a Christmas tree, loaded with gifts, bears an important part. Its origin, however, is Teutonic, for it was introduced into England by Prince Albert on his marriage with Queen Victoria. But it was the Romans who took it to Germany; and, as every schoolboy knows (or ought to know), there is an allusion to it in the second Georgic of Virgil.

The agreeable practice of giving "Christmas boxes" is lost in the mists of antiquity. Such tokens of good will, however, were formerly presented on December 26, which was thus called "Boxing Day."

In bygone times kings and queens were very lavish in their distribution of "Christmas boxes." Even such a notoriously "close" monarch as Henry VII parted with considerable sums at this period. Queen Elizabeth, however, reversed the process, and, instead of giving them, accepted presents from her loyal subjects. One, from Archbishop Parker, took the form of "£40 in demi-sovereigns in a red silk purse," while Lady Cheeke offered "a russet purse with £4 therein."

Thrifty Elizabeth would also hold out a hand for gifts "in kind" from even the humblest members of her domestic staff. Thus, it is on record that "two rolls of cambric" were the tribute of "the Dustman," and "the Apothecary" filled the capacious royal stocking with "three boxes, one of green ginger, one of ginger candy, and one of orange candy." It would appear that Her Majesty had a "sweet tooth."

Pantomimes have long been associated with Christmas in England. The first to be seen in London was "Harlequin Executed," at the Lincoln's Inn Fields Theater in 1717. This was followed by "Harlequin Doctor Faustus" at Drury Lane.

A very old custom connected with Christmas comes from Scandinavia. This is that of burning a "Yule log." In former days it was always lighted from a brand that had been carefully saved from the previous year's specimen. While it was burning, there would be a vast amount of feasting and singing and telling of stories.

To insure fitting merriment from morning to night, the squire or chief landowner in every village would appoint a "Lord of Misrule." During his sovereignty, which lasted twelve days, no glum faces were allowed. "The strong beer," says a chronicler, "was broached, and the black jacks went playfully about, with sugar, nutmeg, and good Cheshire cheese. The meat had to be boiled by daybreak, or else two young men would take the cook by the arms, and run her round the market place till she was ashamed of her laziness."

Other times, other manners. Nowadays, any cook subjected to this sort of discipline would "give notice" on the spot.

At the Universities of Oxford and Cambridge the functions of the "Lord of Misrule" were taken so seriously that they were intrusted to a Master of Arts. In the year 1625 his representative among the law students at the Inns of Court in London is said to have subscribed a sum of £2,000 to keep the fun going. King Charles thought so much of this lavishness that he rewarded him with a knighthood.

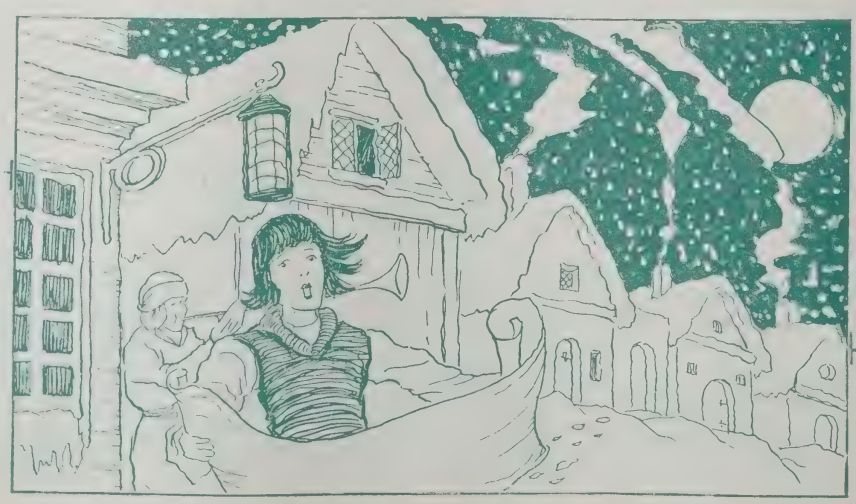
A standing dish in the old-time Christmas menu was a boar's head. This, escorted by minstrels, always followed the plum pudding and snapdragon. At Queen's College, Oxford, the "Boar's Head Carol," which dates from 1521, is still sung. This begins:

"The boar's head in hand bear I,
Bedecked with bays and rosemary,
And I pray you, my masters, be merry.
*Quot estis in convivio*
*Caput apri defero*
*Reddens laudes Domino.*"

and see there be mustard," says a recipe of the period.

After the boar's head came mince pies. These delicacies earned the esteem of "Rare Ben Jonson," who has recorded their merits in one of his *Masques*.

Christmas cards owe their popularity in England to the introduction of penny postage. While their sale is now said, compared with what it used to be, to have fallen off, it is still very substantial. The first card (with conventional holly and mistletoe on it) is understood to have been designed by a member of the Royal Academy, J. C. Horsley.



Long before there were Christmas cards there were Christmas carols. They date, indeed, from the dawn of Christianity itself. A very beautiful specimen was written about the year 1500, the first verse of which ran:

"When Christ was born of Mary free
In Bethlehem, that fair city,
Angels did sing with mirth and glee
*In Excelsis Gloria!*"

The most popular of all Christmas carols is probably "Old King Wenceslas." This is set to a thirteenth-century air, which, by the way, was adapted from a still earlier Latin one.

An ever memorable Christmas was was that of 1843, when Charles Dickens, who has done more than anybody else to keep the spirit of the festival alive in our hearts, wrote his *Christmas Carol*. When he died, in 1870, a ragged little girl was heard to ask tearfully: "Does that mean Father Christmas will die, too?"

Well, if the question is put to the children, they will certainly say "No!"

# A Logical Development

There is nothing strange in the fact that recently Ford production reached the high peak —even in Ford industry.

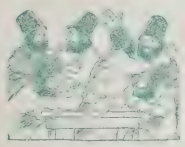
It simply means that the long-established Ford values are even better now. The latest cars are attracting unusual enthusiasm because they combine a new order of beauty, convenience and riding comfort with the well-known Ford reliability and low cost.

This greater value is the logical and inevitable result of the Ford policy of *complete* manufacture, from mine to finished car—and of striving endlessly to reduce waste, eliminate intermediary profits, and to develop the utmost production and distribution efficiency.

Any Authorized Ford Dealer will be glad to point out the many advantages in the latest cars.

FORD MOTOR COMPANY, DETROIT, MICH.

Ford



# Briefly Told

Connecticut with her Yankees led the states last year in invention, one patent being issued to every 1,082 inhabitants, while Mississippi brought up the rear with one to every 19,463.

The Chilean Hall of Fame contains many English and Scotch names.

The Canton Christian College in China has developed disease-free silkworms that produce several times as much silk as the ordinary farm variety.

In very early times the name for the British Isles was "The Country of Green Hills."

You cannot, it is said, gather six Russians together in a room without hearing six different opinions on any subject discussed animatedly.

According to Pliny, the Gauls of Caesar's time wore a ring on the middle finger, but the fashion of the next generation changed so that finger was left bare, while all the rest were loaded.

London's new automatic telephone system will take 15 years to complete.

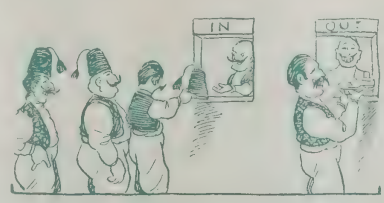
The area where China, Tibet, and India meet is sometimes called "Any Man's Land."

Whales swim by moving their tail fins up and down, and they are able to swim so rapidly with so little apparent exertion because of the ideal propeller construction of their tails.

The sense of smell is the strongest sense that insects have. Few of them can see more than three feet, and they hear only through the vibration of their feelers.

Locusts, the short-horned grasshopper, have been a recurring plague through all history. This year they have become a devouring pest in British Columbia.

In the time of Cicero a Roman senator was prohibited by law from engaging in any business that would take him out of Italy.



The Stone Age Man of Britain was clever enough to trepan a skull to relieve pressure on the brain. The teeth of the operating saws are so fine that to see them one needs a magnifying glass.

New York's first newspaper was published just 200 years ago. It was known as the New York *Gazette*.

The Christmas tree, which has become an almost universal symbol, and is by most persons supposed to have originated in Germany, had its origin in Egypt at a period long before the Christian Era. The palm-tree is known to put forth a branch every month, and a spray of this tree, with twelve shoots on it, was used in Egypt at the time of the winter solstice, as a symbol of the year completed.

A whole radio program has been broadcast from East Pittsburgh, received by London, and retransmitted to British India, thus joining East and West through the medium of the ether.

The song, "The Sweet Bye and Bye," composed in the lantern light of a country store, brought a royalty of $56,000, but not until 50 years after its composer, Joseph P. Webster, of Elkhorn, Wisconsin, had written it.

The Turkish headgear of yesterday is being made into foot warmers of today. The Red Crescent, corresponding to our Red Cross, is collecting discarded fezzes and having them made into bed slippers.

Newspapers in inland Asiatic cities are sold at reduced rates when earlier readers get through with them.

With the exception of a privileged few, Japanese radio enthusiasts are limited in their reception to the single wave length of 375 meters, their sets being sealed for other wave lengths.

As a beginning toward the goal of "the liquidation of illiteracy by 1928," the commissariat of Russia printed special primers and scattered them broadcast over the country in 1921.

The troubadour grasshopper is one of the four or five insects capable of making a noise. He has no voice. He uses his hard wing cases as a sounding board, drawing the shank of his leg across them and thus producing his music. The katydid and the cricket are likewise noisy, but the devil's horse is silent.

Impressed by the multitude of pamphlets issued by the Department of Agriculture, an Oswego, Kansas, farmer has appealed for information on "how to put on a shirt, eat an apple, peal potatoes, adjust a dog collar, and eat a chicken."

Scientists have found that Marathon runners and other athletes who eat sugar and candy before exertion come through their races in better physical condition than those who run "unsweetened."

Excavations in the San Francisco Bay region of California show that the Indians of 3,500 years ago had the same customs and lived then as their descendants live today.

It was in Delmonico's that salads of chicken and lobster first made their appearance, that chicken *a la king* and lobster Newburg were invented, that French fried potatoes, Russian dressing and terrapin were first served in New York, and that minute steak was invented by Edwin Gould.

# A Visit from St. Nicholas

ILLUSTRATED BY
RUSSELL H. LEGGE

'TWAS the night before Christmas, when all through the house,
Not a creature was stirring, not even a mouse;
The stockings were hung by the chimney with care,
In hopes that St. Nicholas soon would be there;

The children were nestled all snug in their beds,
While visions of sugar-plums danced in their heads;
And mamma in her 'kerchief, and I in my cap,
Had just settled our brains for a long winter's nap,
When out on the lawn there arose such a clatter,
I sprang from the bed to see what was the matter.

Away to the window I flew like a flash,
Tore open the shutters and threw up the sash.
The moon on the breast of the new-fallen snow
Gave the lustre of mid-day to objects below,
When, what to my wondering eyes should appear,
But a miniature sleigh, and eight tiny reindeer,

With a little old driver, so lively and quick,
I knew in a moment it must be St. Nick.
More rapid than eagles his coursers they came,
And he whistled, and shouted, and called them by name;
"Now, *Dasher!* now, *Dancer!* now, *Prancer* and *Vixen!*
On, *Comet!* on, *Cupid!* on,
*Donder* and *Blitzen!*
To the top of the porch! to the top of the wall!
Now dash away! dash away! dash away all!"
As dry leaves that before the wild hurricane fly,
When they meet with an obstacle, mount to the sky,

So up to the house-top the coursers they flew,
With the sleigh full of toys, and St. Nicholas too.
And then, in a twinkling, I heard on the roof

The prancing and pawing of each little hoof.
As I drew in my head, and was turning around,
Down the chimney St. Nicholas came with a bound.
He was dressed all in fur, from his head to his foot,
And his clothes were all tarnished with ashes and soot;
A bundle of toys he had flung on his back,
And he looked like a peddler just opening his pack.
His eyes—how they twinkled! his dimples how merry!
His cheeks were like roses, his nose like a cherry!
His droll little mouth was drawn up like a bow,
And the beard of his chin was as white as the snow;
The stump of a pipe he held tight in his teeth,
And the smoke it encircled his head like a wreath;
He had a broad face and a little round belly,
That shook, when he laughed, like a bowlful of jelly.
He was chubby and plump, a right jolly old elf,
And I laughed when I saw him, in spite of myself;

A wink of his eye and a twist of his head,
Soon gave me to know I had nothing to dread;
He spoke not a word, but went straight to his work,
And filled all the stockings; then turned with a jerk,
And laying his finger aside of his nose,
And giving a nod, up the chimney he rose;
He sprang to his sleigh, to his team gave a whistle,
And away they all flew like the down of a thistle,
But I heard him exclaim, ere he drove out of sight,
"*Happy Christmas to all, and to all a good-night.*"

—*Clement Clarke Moore.*

URBANA ILL

BOOKS are the best of things, well used; abused, among the worst. What is the right use? What is the one end, which all means go to effect? They are for nothing but to inspire. I had better never see a book, than to be warped by its attraction clean out of my own orbit, and made a satellite instead of a system. The one thing in the world of value is the active soul. This every man is entitled to; this every man contains within him, although, in almost all men, obstructed, and as yet unborn.

—*Ralph Waldo Emerson.*

CHRONICLER OF THE NEGLECTED TRUTH

# BRIEFLY TOLD

It is an error to say that Franklin's kite experiment led to the construction of lightning rods. We have Franklin's own words that the kite experiment followed the rods.

The bald eagle is not really bald, but from a distance it appears to be so. Its head and part of its neck are pure white.

So far as is known, the state of Rome borrowed money from individuals for the first time at the beginning of the war with Hannibal 215 B. C.

A French historian has written, "Money is like the water of a river; if it suddenly floods, it devastates; divide it into a thousand channels where it circulates quietly and it brings life and fertility to every spot."

Figures given out by the rural economics department of the Ohio State University show that the average Ohio farm horse works only two hours a day at a cost of a little more than 15 cents an hour.

Women of the Kashgar oasis weep at the graves of their parents as a demonstration of their ancestor worship.

A Greenland conjurer against evil spirits once advised Kaj Birket Smith, a Danish explorer, to sew his boots to the back of his mother's dress to be worn there the rest of her life.

Ferdinand Boberg, the Swedish artist, in attempting to preserve a likeness of all that is characteristic in Sweden, has made more than a thousand drawings of old-fashioned buildings and early industries.

The Island of Culion, the Philippine site of the largest leper colony in the world, was one of the first places under the American flag to give women the right to vote.

With his head pillowed against a corner of the cement box, an Atlanta, Georgia, man went to sleep in a mortar of fresh concrete. He awoke encased in stone and it was necessary for him to visit a hospital to have the covering removed under the directions of surgeons.

Chuquicamata in Chile is the heart of the greatest copper-bearing area in the world. The largest single North American investment south of Panama employs here $100,000,000. The Chileans are the Yankees of South America.

Cooks in London, England, refuse to accept positions unless they are assured that their kitchens will be wired with a radio extension from the wireless installation of the family upstairs.

The United States Bureau of Fisheries has discovered that barnacles on ship bottoms collect only on plates painted blue and black and that other colors are practically free from them.

The Egyptian women thought they could strengthen their hair by rubbing it with a donkey's tooth crushed in honey.

Neither horses nor sheep will eat the "horse sorrel" or "sheep sorrel" that grows on thousands of acres of acid land that lime would remedy.

Headlights and tail lights on baby carriages are necessary in Milwaukee, according to the literal interpretation of city ordinances of that city.

The Bakarganj cyclone of 1876 from the Bay of Bengal brought so much rain that the loss of life from drowning was 100,000 in six hours.

Napoleon traveled from near Vilna to Paris in 312 hours. An ordinary traveler could not have done this distance in twice the time. Railways have reduced the journey to less than 48 hours.

Local anti-barberry laws were passed in France as early as 1660. The common barberry was completely eradicated from Denmark in 1903, since which time no black stem rust in wheat has been noticed there.

In remote rural districts in Norway the bride dons the native dress of her district and rides to the church ceremony on a pony.

A study of Washington's transportation shows that it costs the average car driver there 11.49 cents a mile to run his automobile.

Walking is not a "lost art" in Berlin, for hundreds of thousands of pedestrians fill the parks and boulevards on pleasant evenings and Sundays.

Many women in Danish restaurants in Copenhagen smoke cigars.

The Chinese do not bury their dead underground until a "lucky day" comes, the corpses often being kept in wooden boxes for many days, as centers of disease infection.

An asbestos suit that can be used for protection in rescuing a fire victim is on exhibit in the American Museum of Safety in New York.

Arabs call the snipe the "father of long noses."

Byron W. Huhn, silk hat manufacturer for most of the Presidents since the time of Grant, recently died at his Milwaukee home.

A man claiming to be a descendant of Alexander the Great is now a postmaster in the Sarikol Valley in India.

Three years ago, Andrew S. Rowan, the man who "carried the message to Garcia," in the Spanish American War, received the Distinguished Service Cross.

The Weather Bureau of India issues warnings of danger of sunstroke or heat apoplexy when the wet bulb temperature approaches 85 degrees Fahrenheit.

Shortly before the primaries last October, a columnist of the Erie, Pennsylvania, *Times* announced in his daily column that he was going to run for sheriff because he "needed the money." He meant the statement as a joke, but his friends took it otherwise and would not permit him to withdraw and he was elected sheriff, according to reports.

Volume 26
Number 9

# The Essence of This Issue:

Mr. Ford's Page this week discusses common sense as a business guide. (p. 9)

Although our Christmas Number came last week in all its color and flavor and good cheer, we are still within the date of Christmas, which justifies an overflow this week. Though such an explanation should not be necessary, should it? Suppose that Christmas lasted till Spring, would any complain? The right kind of Christmas really lasts a long, long time.

There is a little meditation that may lead you into the inwardness of the Season, a view of Christmas not often expressed. (p. 2)

"And that night, when the Star shone, and the Three Wise Men took their journey toward the East, they carried with them a necktie box, an egg-beater, and a silver cigaret case to lay at the feet of the baby King." Isn't that delicious? And doesn't it mark the difference between Xmas presents and Christmas presents? You will rather enjoy this little whimsy concerning the Three Wise Women who went shopping. (p. 19)

Outdoors in the winter woods of the North, where huge fires wrap the tall dark pines in ruddy mantles, they bootleg—beaver furs. The story is told by Donald Hough—the name itself a guaranty of authentic observation. (p. 4)

Well, politics are on us again with a jump. The World Court is the big international question before the American Congress. It has its friends, and its opponents. The line-up on either side is somewhat surprising, too. Senator Borah seems to believe that the Court is being trickily used as a means to inject the United States into the League of Nations. An article on the leaders of the opposing forces by Mr. Newman. (p. 5)

PUBLISHED WEEKLY BY
THE DEARBORN PUBLISHING COMPANY
DEARBORN, MICHIGAN
Henry Ford, President; E. G. Liebold, Vice-President and Treasurer;
C. B. Longley, Secretary; W. J. Cameron, Editor.

This is not a Women's Number, yet there seems to be several articles of especial interest to the distaff side of the house.

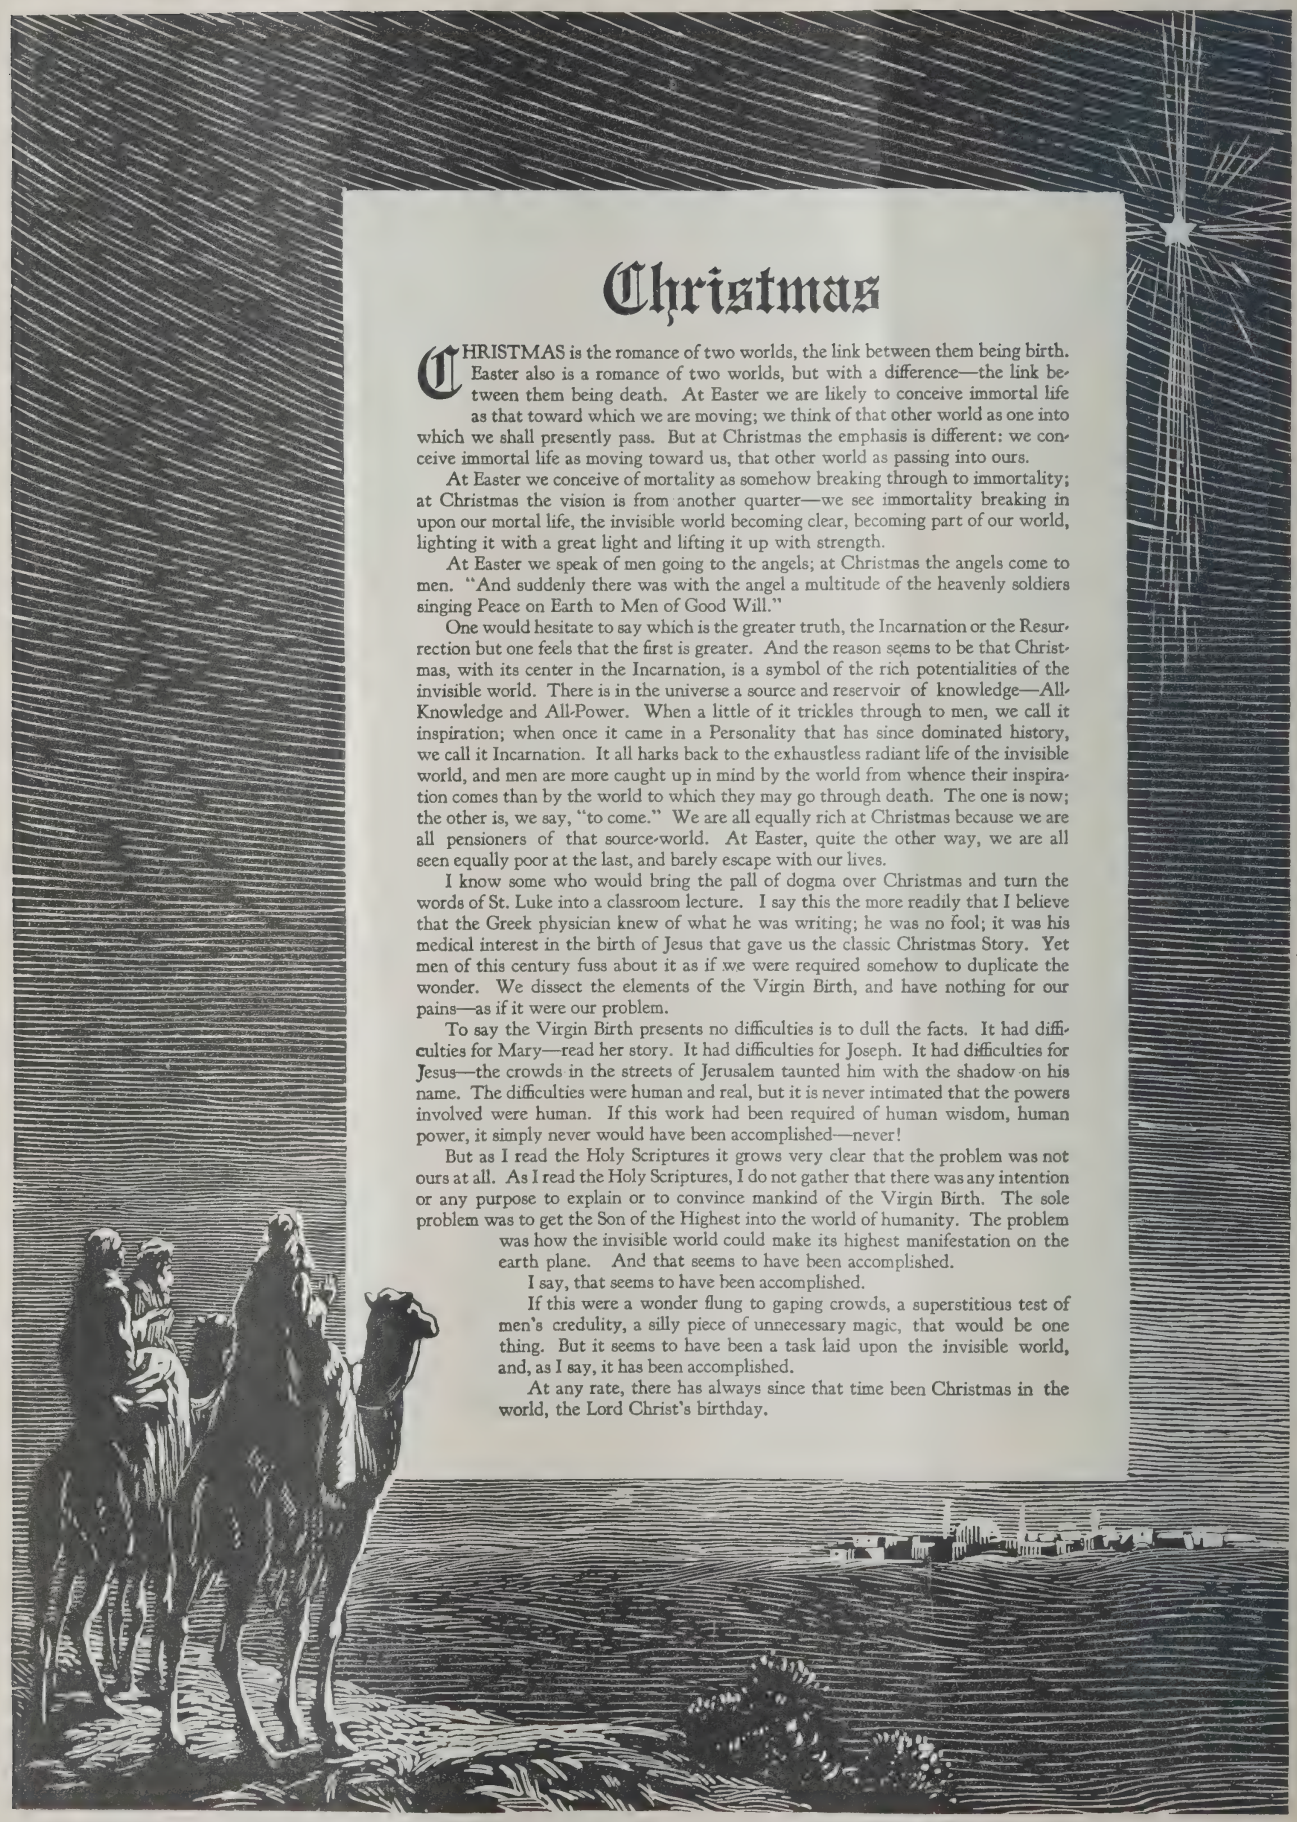
For example: Why do they persist in describing the housewife as "not gainfully employed"? That is what one southern woman asks. And then she goes on to describe what a woman of "no occupation" does. *It is a story you will like.* (p. 6)

At the other end of the scale of woman-interest: why do juries so frequently acquit women prisoners? Mr. O'Hara notes that, though we divorce more women than any other nation, we become amazingly sentimental when it comes to sending them to jail. (p. 8)

This country will never go to the dogs—we yell too quickly for that. Don't mistake the din for the disaster. No people in the world seem to be so able to see in advance the probable result of certain tendencies; no people are so sensitive to the draft—so to speak—of coming events. That is why we hear of more evils than ever come upon us; we see them from afar and head them off. We scare the dogs away. Here is an example of how the cry begins. (p. 3)

We all like the South because it is American. But something of the Old South is disappearing in the new development. We print this article because of the sound value we think it has. (p. 20)

The gentle art of investigating, which supplants golf as a Washington amusement, has reached proportions that make the cross word puzzle and mah jong crazes, combined, look like pikers. It is very timely that Colonel Johns should investigate the investigations. (p. 14)



Hooked rugs—they seem to be part of the revived interest in the lovely old house furnishings of our forefathers. (p. 12)

"Buffalo Bill" is still a name to conjure with in childhood's pleasant land, and here is the experience of a man who lived with "Buffalo Bill" and traveled with his show. Mr. Bacon is an artist of high ability and made his own pictures. Then that night the cyclone struck the show— (p. 16)

Alas, for the builders of the Pyramids; they cannot now paint a window sash without splattering the glass with paint. Yet the blood of the Pharaohs runs very pure in Egypt. As for the "sheiks," the name means "old man." How is that for a blow at the little Valentinos of our land! And it is told by an Orientalist who knows. (p. 30)

SINGLE COPY, TEN CENTS. Subscription price in the United States and its dependencies, also Canada, Cuba, Mexico and countries where the United States Domestic Postage Rate applies, $1.50 a year; other foreign countries, $2.00 a year.

CHANGE OF ADDRESS. 1. Notify us at least two weeks in advance. 2. Give both old and new address. 3. Write clearly.
Entered as Second-Class Matter at the Post Office at Dearborn, Mich., under the Act of March 3, 1879. Additional entry at Chicago, Ill.

# Christmas

CHRISTMAS is the romance of two worlds, the link between them being birth. Easter also is a romance of two worlds, but with a difference—the link between them being death. At Easter we are likely to conceive immortal life as that toward which we are moving; we think of that other world as one into which we shall presently pass. But at Christmas the emphasis is different: we conceive immortal life as moving toward us, that other world as passing into ours.

At Easter we conceive of mortality as somehow breaking through to immortality; at Christmas the vision is from another quarter—we see immortality breaking in upon our mortal life, the invisible world becoming clear, becoming part of our world, lighting it with a great light and lifting it up with strength.

At Easter we speak of men going to the angels; at Christmas the angels come to men. "And suddenly there was with the angel a multitude of the heavenly soldiers singing Peace on Earth to Men of Good Will."

One would hesitate to say which is the greater truth, the Incarnation or the Resurrection but one feels that the first is greater. And the reason seems to be that Christmas, with its center in the Incarnation, is a symbol of the rich potentialities of the invisible world. There is in the universe a source and reservoir of knowledge—All-Knowledge and All-Power. When a little of it trickles through to men, we call it inspiration; when once it came in a Personality that has since dominated history, we call it Incarnation. It all harks back to the exhaustless radiant life of the invisible world, and men are more caught up in mind by the world from whence their inspiration comes than by the world to which they may go through death. The one is now; the other is, we say, "to come." We are all equally rich at Christmas because we are all pensioners of that source-world. At Easter, quite the other way, we are all seen equally poor at the last, and barely escape with our lives.

I know some who would bring the pall of dogma over Christmas and turn the words of St. Luke into a classroom lecture. I say this the more readily that I believe that the Greek physician knew of what he was writing; he was no fool; it was his medical interest in the birth of Jesus that gave us the classic Christmas Story. Yet men of this century fuss about it as if we were required somehow to duplicate the wonder. We dissect the elements of the Virgin Birth, and have nothing for our pains—as if it were our problem.

To say the Virgin Birth presents no difficulties is to dull the facts. It had difficulties for Mary—read her story. It had difficulties for Joseph. It had difficulties for Jesus—the crowds in the streets of Jerusalem taunted him with the shadow on his name. The difficulties were human and real, but it is never intimated that the powers involved were human. If this work had been required of human wisdom, human power, it simply never would have been accomplished—never!

But as I read the Holy Scriptures it grows very clear that the problem was not ours at all. As I read the Holy Scriptures, I do not gather that there was any intention or any purpose to explain or to convince mankind of the Virgin Birth. The sole problem was to get the Son of the Highest into the world of humanity. The problem was how the invisible world could make its highest manifestation on the earth plane. And that seems to have been accomplished.

I say, that seems to have been accomplished.

If this were a wonder flung to gaping crowds, a superstitious test of men's credulity, a silly piece of unnecessary magic, that would be one thing. But it seems to have been a task laid upon the invisible world, and, as I say, it has been accomplished.

At any rate, there has always since that time been Christmas in the world, the Lord Christ's birthday.

# Governors Plead for Their States

## At Washington as Suppliants to State Representatives for Securing Justice

By AARON HARDY ULM

—Washington.

SINGULAR spectacles are common at the National Capital but not many are so strange as one which took place there recently. Curiously, its newness and oddity were scarcely recognized at all—perhaps because of its probable futility.

The spectacle comprised an appearance in Washington of a group of governors who came to plead for the states. The pleas were not made to the heads of bureaus who in many cases exceed in matters of power and prestige the heads of what used to be regarded as sovereign governments. For pleas to them on behalf of the states would be, in most instances, comparable to a canary pleading with a hungry cat.

The governors came to Washington to plead, with representatives of the states on behalf of the states. They addressed themselves to men who hold commissions signed by the governors of states and bearing state seals, but who now, in most instances, regard themselves wholly as functionaries of the Federal Government. These are members of the Congress of the United States, which by its very name is meant to be primarily an assembling of Representatives of the states, or the people thereof.

The plea, bearing on a point of taxes, may be sound or fallacious. Yet the fact that nearly a score of governors joined in making it is extreme attestation of a trend and perhaps some evidence of a revival. The trend is that of the Federal Government toward the usurping of rights and powers belonging to the states, and the revival is that of interest in the old subject of States' Rights.

In view of the history of that trend during the last dozen years, it is most curious of all that the group protesting it was led by the governor of a southern state. For most of the expansion of the Federal Government in recent times has been with the permission of, and even promoted by, most of the Southerners having to do with it and the political party which they support almost exclusively.

Barring a few individual instances, and some others that consist of platitudinous talk only, States' Rights doctrine has depended lately almost wholly for support on precincts not identified with it historically.

Originally this doctrine was supported mainly by "little" states which feared that they might be gobbled up or oppressed by the big ones. Then it came predominantly out of the South, and expressed itself through the political party supreme in that section.

But of late the most pointed and sincere appeals for States' Rights have been made by Northern Republicans of, usually, "big" states—men who, as a rule, think much more of Alexander Hamilton than they do of Thomas Jefferson.

What accounts for this change? The answer is so obvious that it is amazing none of the founders of the Federal Government thought of it. It is because the "little" states are more numerous than the "big" ones. Instead of the small state being endangered by the greater power of the large one, the "big" states have all to fear from the combined power of the "little" ones.

Neither bigness nor smallness is measured alone by area or population or both. By the first factor, representation of the states in the House of Representatives is divided. But all are equal in the Senate. Even without this advantage in the Senate, the power of the "little" states would be much greater than that of the "big" ones.

In gauging the true size of a state a factor equal to that of area or of population enters. This is wealth. Thus some states that are large in area or population, or both, line up on States' Rights with ones that are small—because they are or regard themselves as "poor." And, conversely, some that are small in one or both of the first respects line up with the "big" states because they happen to be rated as wealthy.

You might put it this way: The "poor" states are more numerous and, following a natural but not beautiful instinct, line up together against the "rich" ones.

This doesn't mean that the small or "poor" states are really burdened with poverty in a greater degree than the big and "rich" ones. It is probable that the reverse is the case; that is, when judged by na-

At night, after the sleet storm, we built a huge fire and dried out."

# Trapping Trappers in the Near North

## Bootlegging Beaver Hides the Biggest Game Along the International Border

By DONALD HOUGH

I STOPPED at the end of the railroad; and because the little town was built high, I could see far to the north, to the east and to the west, where apparently limitless forests, snow-covered, reached to the horizon.

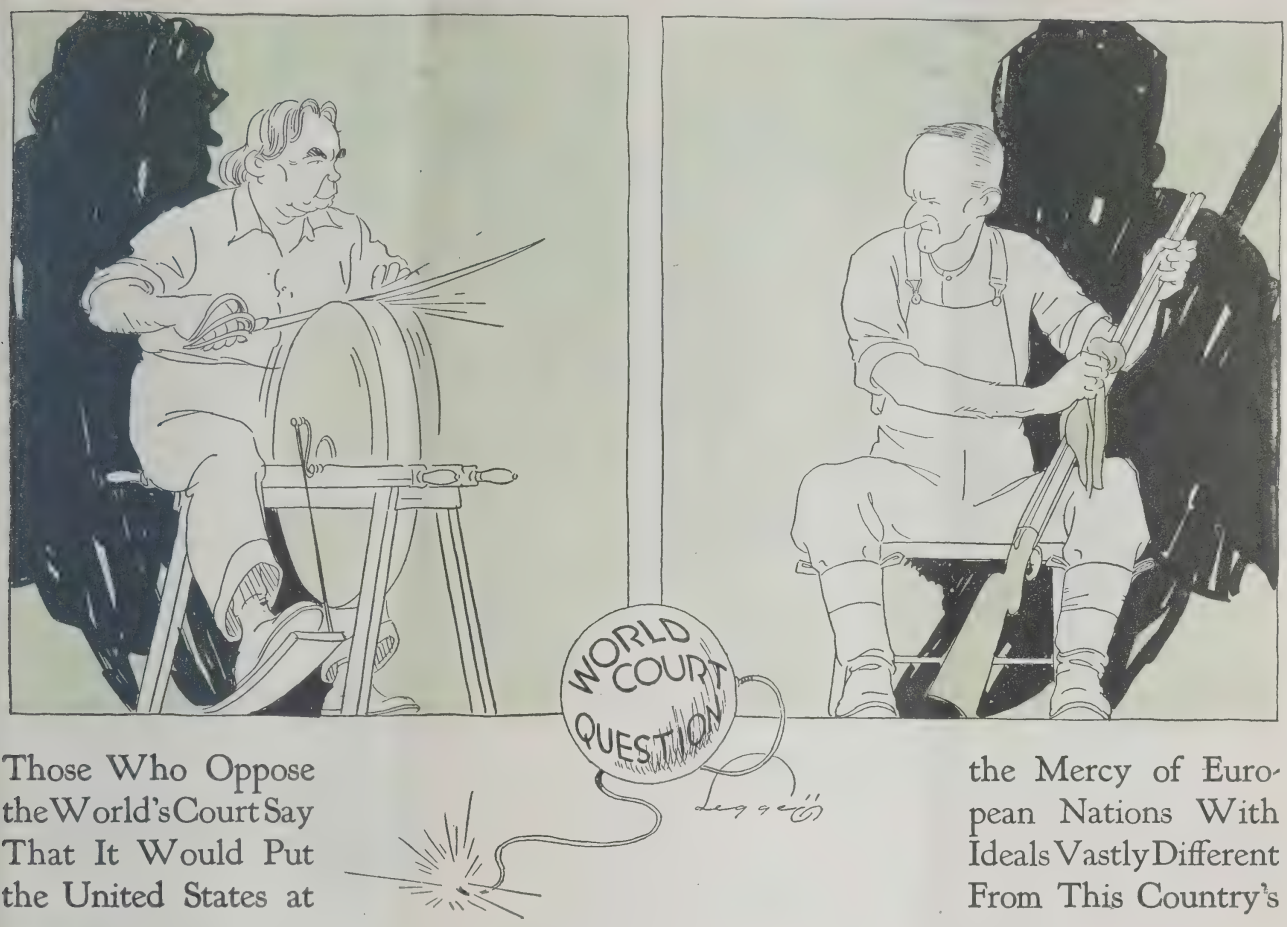
I was interested in the little town. It was the "jumping off place" for the only "Far North" in the United States: the northeastern corner of Minnesota, hemmed in by the Canadian boundary and Lake Superior. A wilderness of great forests and countless lakes lies there.

I had known the region in the summer, when people come to canoe through the labyrinth of waterways that has marked this country as a thing apart from other forest areas. I knew that in the summer all travel through more than five million acres of land and water and virgin forests is by canoe, just as it was when the Hudson's Bay trappers had counted it a great prize, and when the routes of the early French and English traders—yes, and soldiers, too—had counted its waterways as an important link of communication from east to northwest.

"The little girl's only plaything was a wooden cow."

But it is in the winter that the curtains are drawn and the dramas of our only North country, minus only the Sergeant of the Mounted who always gets his man, are enacted.

I had not gone far up the principal street of the snow-bound town when I met a wind-tanned man in parka and moccasins, driving a team of five huskies hitched to a long toboggan. I recognized him as a state game warden—one of more than a dozen of the best woodsmen in the North who were carrying on a relentless war against the biggest bootlegging game along the international border. No, you guessed wrong. It's beaver hides. Liquor running is childish beside it. Also, the profits of liquor running are pin money compared to the gains of the beaver trappers.



The game warden stopped and extended a mittened hand. His dogs lay down in the snow, their curled-up tails still wagging nervously.

"What's the dope?" I asked him.

"Going over the eastern trails," he said, "the outlaws are planning a drive and we're planning one, too. Five teams of us going out tomorrow."

Ten minutes lat- (Continued on page 24)

# Should America Join World's Court?

## Those Who Oppose the World's Court Say That It Would Put the United States at the Mercy of European Nations With Ideals Vastly Different From This Country's

By OLIVER P. NEWMAN

ILLUSTRATED BY RUSSELL H. LEGGE

THE question whether the United States shall enter the World Court comes up automatically in the Senate on December 17. On that date the World Court becomes the "unfinished business" of the Senate, which means that nothing else can be done (except by unanimous consent) until the World Court question is disposed of. This parliamentary status was fixed by unanimous agreement before the Senate adjourned last spring. It may be anticipated, therefore, that a final determination of the World Court issue will be reached. The end will not come, however, until after a long controversy, in which some of the ablest members of the Senate will be arrayed against each other. The struggle may rival in intensity the long battle over the League of Nations, prohibition or women's suffrage.

The question at issue is whether the United States shall adhere to the Permanent Court of International Justice at The Hague (popularly known as the World Court) and, if so, upon what terms. President Coolidge is the leading advocate of American adherence, on the basis of the so-called Harding-Hughes reservations. Senator Borah, of Idaho, the powerful chairman of the Foreign Relations Committee, is the leading opponent of American entry. Thus is presented the unusual situation of an Administration striving to put through a vitally important international policy over the head of the chairman of the Senate committee in charge of legislation dealing with international relations.

There is no public opinion favoring the United States entering the World Court. The people have not discussed it, have no leaning toward it. There is plenty of special propaganda, however, of the kind that is specifically addressed to officeholders, but not to voters. This Administration is in favor of entering the Court. Such a step, however, should not be taken without definite and general public approval. There is as yet not even public interest. In this respect the question is dead, or has not been born. If the people are to be put under jurisdiction of a European court, it seems reasonable that they should know something about it.

Back of Borah stands a small but vigorous group of Senators opposed to American adherence on the Harding-Hughes basis. Among them are Moses, of New Hampshire; Lenroot, of Wisconsin; Pepper, of Pennsylvania; Norris, of Nebraska; and Johnson, of California, Republicans; and Shipstead, of Minnesota, Farm-Labor. For the last few years these men have been distinctly the fighting members of the Senate. They are the "crusader" type. With them in the World Court battle is also picturesque "Jim" Reed, of Missouri, Democrat, another crusader. These Senators are aggressively opposed to the Administration's World Court proposal and may be expected to fight it with all their well-known combative ability.

Against this compact, vigorous, capable opposition the Administration stands without any aggressive champion. Most of the Republicans are inclined to go along with President Coolidge and pass his World Court resolution, with the Harding-Hughes reservations. It is strikingly significant, however, that there is no outstanding Republican (Concluded on page 27)

"No one else can care for my child as I can."

# Women of No Occupation

## One of Them Tells Us About Being "Gainfully Employed"

By MARY WILLIS SHUEY

ILLUSTRATED BY EDITH GRIEVE

THE woman who works downtown for $15 a week is "gainfully employed." The mother of several small children, busy with home tasks and problems, is *NOT* "gainfully employed." A philanthropist, perhaps—but of no gainful occupation!

Now this is no brief for wages for home women. Nor is it the pity-the-poor-woman plea of popular women's magazines. We are about the happiest women you'll find—we "unoccupied" mothers who are ignored by the industrial census-takers. But it rankles in our minds that, aside from sickly sentimentalities and oratorical flourishes, our work is really never considered.

As we see it, there are very few women who are as "gainfully employed" as we are! We control the greatest national asset—our thirty-five million children. Factories and stores and offices seem unimportant beside these. Both the work and the salary of the employed woman seem small when measured by *OUR* work and *OUR* returns. The woman with small children who holds a census job must draw a large salary before she can replace herself in the home and be sure that her children have approximately the same care that she herself would give them.

Of course, there are people who tell us that motherhood is a purely physical affair. It is merely a matter of a few months. They say that children can be as well cared for by a competent nurse as by a mother—better cared for, in many instances, as they will not be humored in bad habits. Some of the strict behaviorists among our modern psychologists are quoted to prove that a child actually develops better if let alone by the parent. But right there is where we quit being "modern" and turn fundamentalist!

No one else can care for *MY* children as *I* do You can't offer me any work that would take me away from my children that would seem half as important as what I am now doing. It isn't that I have a woman's-place-is-in-the-home complex, but my place right now *IS* in the home. Woman's place is always where she is needed most.

But the census-taker doesn't see it that way!

He came on a morning that had been a mad rush from the time the alarm clock sounded—one of those hectic mornings that every mother of little children knows so well that she comes to take them calmly.

Not that anything unusual had happened. We had just gone the customary routine, without accidents of any kind. There had not even been a cut foot or a bee-sting, nor had I been called to referee a fight. Just a plain, everyday, any-woman morning.

Mornings, to those of us who are southern-born, are somewhat complicated by a tradition on which we've grown up—that in the afternoon we must maintain the outward appearance of leisure. There is no harder job than to do housework and not *LOOK* as if you do! To do kitchen work, but keep a living-room attitude; to know Fannie Farmer, and live by her, but to talk Freud—that belongs to our job. To keep silver polished and our nails equally bright; to make up our beds and our faces too; to cook a dinner and then eat it as if we hadn't—that is real *ART!*

But we women-of-no-occupation manage it. Breakfast, to start the day right, must be a peaceful, almost orderly, meal. It isn't always simple to achieve that, when there are children to dress, school lunches to prepare, and all the other incidentals. Then the older children must be started to school, as the man-of-the-family leaves for his office. Rush and confusion may sometimes mar things, but as a rule things move in that smooth fashion that *looks* so easy!

The census-man came right in the middle of the morning. Up to that time the morning had gone as follows:

After the school-and-office exodus, the cook had done most of the housework while I prepared the baby's milk for the day, cut and arranged the flowers, marketed with the four-year-old, bathed and dressed the baby, and settled him for his morning nap.

We had guests invited for dinner that evening, and I had a club meeting at 2 o'clock. The cook must be nurse all afternoon, so I had made the early preparations for dinner while she finished ironing—that always unfinished task where there are babies. There had been the usual interruptions of telephone calls, a half-forgotten parent-teacher report to finish, and reminders from time to time that several of the newly ironed suits needed buttons.

That was when the bell rang, insistently. Too insistently, I might have known, for anyone I really wanted to see. It roused the baby from his morning nap, and I had to pick him up on the way to the door.

"I'm taking an industrial census," said the man, notebook in hand.

"Husband's name? Occupation? Anyone else in this house gainfully employed?"

That was stage one of this irritation about employment, for he frankly told me that *I* was utterly unimportant! There is no use arguing with a census-taker, but there is something downright aggravating in being told at half-past ten in the morning that you are non-productive! Later on in the day, bathed, relaxed and in the attitude-of-leisure, we might let it pass unnoticed. But not at 10:30 a. m.

There is something downright aggravating in being told at half-past ten in the morning that you are non-productive."

Stage two of irritation came that afternoon.

Perhaps the trouble was that I have never truly *BELONGED* to that club. It is a group of semi-professional women who take their work very seriously. They are clever and stimulating, and curb any tendency toward baby talk, but it is hard to be solemn about them. Some of them are married, some de-married, and nearly all are fairly successful from a standpoint of money returns for their work.

But those of us with mixed tendencies find ourselves Marys in the midst of Marthas, and Marthas when we join the Marys. Every now and then I got to wondering if it required as much effort and management to leave *THEIR* work as it did for me to leave mine. And wondering just what kind of homes these women had, behind the scenes!

They discussed investments and successful management—these women-out-on-their-own. There was nothing at all remarkable in the stories they told. I knew of dozens of women more successful—women who on small household allowances pay all the house bills, have attractive clothes for themselves and their children, save for summer trips and even manage a building-and-loan fund. There are financial wizards among the women-of-no-occupation. Next door to me is a woman with an allowance of $100 a month. She pays all the house bills for four—food, light, gas, ice, et cetera—clothes for herself and her two children, and keeps a part-time servant. Yet she always seems to be ready for any worthy church or charity appeals. *THAT* is what I call successful management; but I doubt if the employed women would consider her "gainful." She is just one of the "idle" women we sometimes meet playing bridge, wearing clothes that they have made themselves at costs that undercut even a correspondence course ad. Only they never tell about it, for it isn't the thing to put a low price tag on your best clothes!

The talk veered to this idle woman.

"Please don't start on occupations!" I protested. "The census-taker has already informed me today that I am not gainfully employed, so you needn't rub it in!"

"How ridiculous!" exclaimed my friend the decorator. "Isn't writing——"

"*Writing?*" I interrupted.

For it dawned on me that I had completely forgotten to tell the man I had a newspaper department.

The truth was that it seemed unimportant when he interrupted the morning's work of a lady of leisure.

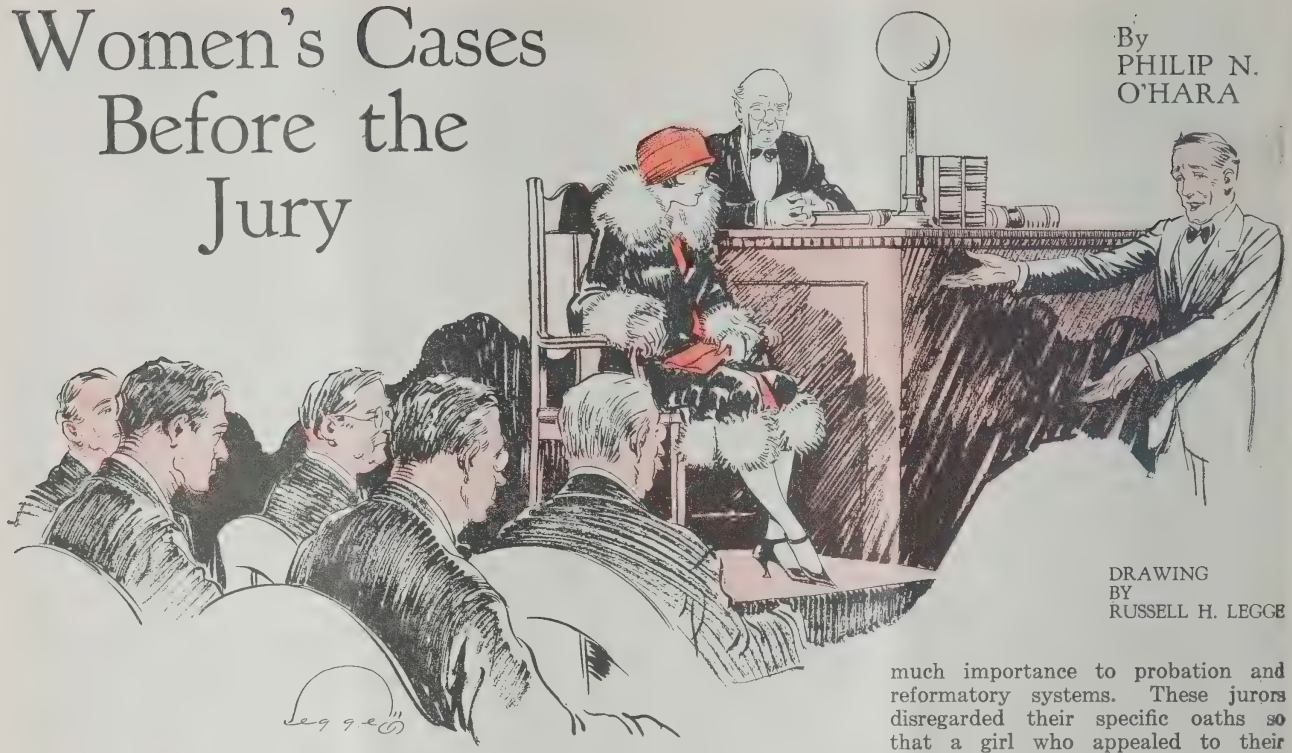
I write, mainly because it is one of the things that makes me happy. I'm not satisfied unless I'm putting ideas into words. There is a lot more thrill in it than in the hardest game of bridge. I'd rather finesse a phrase than get a ten-spot, and there is more joy in a well-turned paragraph than in making a bid of five spades, doubled.

Besides, I'm looking to the future. My present job as mother of small children, general manager of a small home, is not going to last so very long. Children and incomes both grow, and I think we all need some work that is definitely *OURS*. Some day I may consider writing my real work, but at the present time I have no such delusions. My work is my children, and it is a full woman-sized job right now.

I tried to explain this to my friends-with-census-occupations, but they couldn't see it at all. They had that same "gainful" view, and they saw no gain in housework and sewing and keeping health and happiness in a family. Writing paid in money: homemaking didn't. Therefore writing is the "gainful" occupation in which I am engaged.

I came home, determined to find figures before I argued again. It takes a dollar sign to prove things to the career-ful, so here are some dollar marks on this "unoccupied" woman:

An expert in the Department of Labor tells us that if the work being done at home by women had to be paid for in dollars and cents it would cost at the very least—*TEN BILLION DOLLARS YEARLY*.



Of course, we aren't expecting it to be paid, and there isn't all that money left over to pay us *(Concluded on page 19)*

"A group of semi-professional women—and I got to wondering just what kind of homes these women had behind the scenes."

# Women's Cases Before the Jury

By PHILIP N. O'HARA

DRAWING BY RUSSELL H. LEGGE

WHY do American male juries so frequently return verdicts of not guilty in the case of women whose guilt is substantially indicated by the testimony?

The question was raised in my mind recently after sitting through the trial of a girl charged with being the decoy for a pair of bandits. She was not a "good" girl. Though only 19 years of age, she had run away from her husband and was living in adultery. There was little about her to appeal to the senses. The testimony showed beyond contradiction that she induced two youths to drive out to a lonely spot on the city outskirts. There her bandit associates were in ambush and, according to plan, relieved the victims of their valuables.

The case was clear-cut. The defending attorney did not seriously attempt to rebut the prosecution's contentions. In a general way he put forth a plausible version of the affair, but it was palpable that he did not expect to win the case on its merits. He made his greatest effort in addressing the jury. With much blandishment he orated to twelve good American citizens about the bleak gray walls of a prison and painted the harrowing spectacle of a girl still in her teens having to spend the rest of her life there. He did not seek to show that the girl was not the associate of bandits, but he did stress the unfortunate situation of a girl in the clutches of these wicked men.

He knew his jury, he knew what kind of an appeal would register. He was right. After nine hours' deliberation the jury returned a verdict of not guilty.

Allowing an interval to lapse so that they might shed the effects of forensic eloquence and reach a better perspective, I sought out three of the jurors who seemed to be of normal intelligence. I asked them if they really thought that the girl was not the associate of bandits.

All three replied that they thought she was.

I asked them if they really believed that the girl did not in fact decoy the victims to a particular spot so that they might be robbed.

All three replied that they thought the girl did so.

"Then why," I asked, "a verdict of not guilty?"

It was significant that all three predicated their explanations on the fact that the defendant was a girl of 19 years.

"If we found her guilty, she would have to go to jail," said the first. "I think that would do more harm than good."

"I don't think the girl should be held criminally responsible for her acts under the conditions," said the second. "She is young and foolish and was obviously dominated by the men."

"Say," said the third, "you don't catch me sending a kid like that to jail. What kind of a guy would I be?"

They left me with the conclusion that a jury is unwilling to leave a girl's fate up to the judge. It wants to control the final disposition of the case. It is not content to say whether a woman is guilty or not, but is anxious to insure that she shall not go to jail.

Other possible inferences are that a jury regards prisons purely as penal establishments and does not attach much importance to probation and reformatory systems. These jurors disregarded their specific oaths so that a girl who appealed to their sympathies might go free.

Yet each of the jurors, I am sure, realized that in liberating the girl they might not be adopting the course of greatest advantage to the girl herself. They realized, too, that their action might not be for the benefit of other citizens.

Now America is a hard-headed nation. When it indulges in sentiment, it usually does so as a little mental relaxation in much the same way as a woman may draw comfort from tears.

One must believe that the average American is so constituted that he will not send a woman to jail, except in trivial or particularly vicious circumstances. No other nation experiences the same repugnance in anything like the same degree. The American attitude may be attributed to chivalry and its logic is on the same order as Stephen Decatur's universally indorsed maxim, "My country, right or wrong." The American juror says, "Right or wrong, a woman."

Americans are not demonstratively chivalrous, but in practical ways they are superlatively so. The women of this country bulk largely in its economic construction with little or no male prejudice. They enjoy the greatest measure of personal liberty and independence. They come nearer to dominating their menfolk than the women of any other nation. And the men indulge them to an extent that makes other nationalities wonder.

And when they stand in the prisoner's dock they are like Caesar's wife, above suspicion. They are "not guilty."

Yet America leads the world in the number of divorces.

# MR. FORD'S PAGE

HOWEVER imposing the record of swindling may be, it would be a mistake to conclude that the majority of the people are easily fooled. It is true that the number of the deceived is large and the amounts involved are impressive in the aggregate, but both form rather inconsiderable minorities when compared with the whole. That is, the majority of our people use their common sense and the greater part of our money is honest.

With the agricultural scientists seeking a rust-proof wheat and a blight-proof corn and a scab-proof apple, thereby destroying the pests by depriving them of their nourishment, we may hope for people also to become more and more folly-proof and swindle-proof. If the reports are true, and every person bitten is thereby made more wary for the future, the total result must be that the field is being greatly restricted. If every man deceived is thereby turned into a deceit-proof man, the deceivers are bound to go on short-commons at no distant time.

It should be said, in all candor, that the strength of deceitful business practices lies not in the extreme cleverness of the faker, but in the ignorance of his victims. Swindlers are never clever. Their constant contact with an inferior form of mind in their victims robs them of the opportunity to become clever. Cleverness is the result of sound, strong minds working on each other under equal conditions and with similar motives. The swindler naturally picks what are called the "easy marks," the inferior minds, and works on them. It requires no cleverness. It is the irony of the natural law governing these things, that as the swindler grows more sodden in mind by the ease of his conquests, the victim grows clearer and sharper in mind by the pain of his experience. Like the disease germ, the swindler provokes the very force that is to destroy him.

The more important element in this duet is the ignorance of the victim. Once that is defined, a long step is taken toward its correction. The first element in this ignorance is basic: it is *greed.* By that is meant a primitive desire to get something for nothing. Of all the swindles practiced on people, there is not one in which the victim expected to contribute an atom of effort to the great increase that was promised him. He thought the other fellow was going to do it for him. This kind of greed is not to be confused with legitimate ambition to get ahead; the legitimate ambition usually connects with some form of energy and service which will justify the individual getting ahead. But in swindling operations the victims usually expected to get something for nothing. Once they become aware that nothing comes that way, that all the success they see has been paid for at a high cost of application and thought and energy and service, they will be safe from the spoiler.

> *NO ONE is fooled who uses common sense. When common sense says that one cannot get something for nothing, it also says that those who promise this are not reliable. That is, in common sense is the corrective of greed, which is the lure to most pitfalls, and a key to the knowledge of human nature. To know the law of increase and the motives of men is to be wholly safeguarded in all earthly affairs. Few people are not thus equipped. Only a small minority are ever victimized by swindlers, and of these the larger part knew better but took a chance.*

Another element of the easily victimized type of mind is *ignorance of human nature.* We praise knowledge of every kind, yet men often fall into the error of priding themselves on ignorance of human nature. One man said he would rather be fleeced of his last dime than distrust his fellow men. He had a complete misconception of what is meant by a knowledge of human nature.

It certainly does not mean the cultivation of a sour distrust; it means quite the opposite; it means a trained sense of discrimination between the true and the false, the good and the bad, the straightforward and the deviously deceptive. To lack that discrimination is to be of lower intelligence than the birds and dogs who are said to sense the attitudes of persons toward them. Merely to be distrustful is to lose from lack of contact with the good more than is saved by lack of contact with the bad.

In short, human nature being the chief element in human concerns, it is the sheerest ignorance to neglect it. "The human equation," we say, meaning the most uncertain element in all our computations. Those who know its weaknesses and its strength, its probabilities and its more fixed lines, its reactions to this or that given set of circumstances, its reliability when wholesomely motived and its deceit when it falls below the rule of right principle—those who know these things by observation, experience and the inner monitor, walk through the world avoiding pitfalls, free to focus their energy on true accomplishment.

To know that something cannot be had for nothing, and to know how to judge the human element, these form a prudential knowledge, against which sham has no power.

## *Locarno—Hopes and Fears*

HYMNS to Locarno have been many and fulsome; we join in the hope that they will all come true. Failure to join in the hymn should not be interpreted as antagonism to the hope. If two assumptions were true, Locarno might mean much. That is, if it were true that there is or was any possibility of war in the next quarter-century over the Franco-German boundary, and if it were true that nations regard diplomatic signatures as binding in desperate circumstances, Locarno might be said to have given standing ground for preliminary efforts toward the prevention of war. But since it was not at all probable that the next war would start over the question of the German boundary, and hardly possible that it should be started by Germany at all, or even by France; and since it is not probable that any nation would honor its signature at the risk of its national life, the whole matter leaves the world just about where it found it. With this possible exception—that Locarno may indicate a new temper, a new good will, which may spread. The agreement as it stands does not take in the more active war centers and makes no provision for the restraint of the more probable war makers in Europe. The assumption that France and Germany, once restrained, will keep the peace of Europe does not seem based in fact.

What is done is precisely what circumstances would have required in any case, namely, that Britain is called in as umpire in any war that might be started. It gives Britain the balance of power, as between France and Germany, in military matters, a position which she occupied without Locarno and which has been foreshadowed in every agreement proposed by her.

The most that can be said is that if France is truly suffering from fear, the word of Britain might have some effect in allaying that fear. But if she is suffering from *revanche*, Locarno may permit her to become more provocative. Whereas, Germany, if she had no intention of making war, is just where she was before. And if she intends making war she has an advantage she did not possess the last time in knowing the opposing line-up. The remainder of Europe, the really dangerous parts, the Locarno plan scarcely touches.

However, the circumstances have been most difficult, and if the statesmen really have found an element of peace and have utilized it and fixed it into the European structure, time will declare it. And time alone will declare it. There has been a rather noticeable overflow of political advertisement accompanying the business thus far. Solid contributions are not usually of the kind to receive so big an initial boost. Those who await the verdict of time will be wise.

## *Failure*

PROPAGANDA fed to the nations during the war is being carefully scrutinized. The head British propaganda officer informs the world that the "cadaver" story, which represented the Germans as cording up human bodies and shipping them to the rendering vats to recover the glycerine in them for munitions, was founded on the misreading of a German word and that the story was untrue. It is safe to say that it was so regarded by practically everyone who read it at the time.

It now appears, also, that the Kaiser did not refer to the British Army as "contemptible" but as "negligible," a distinction in terms with little difference in the quality of judgment it displayed. Whether as "The Old Contemptibles," as that army dubbed itself, or "The Old Negligibles," the result is the same.

However, to use these incidents as basis for the new propaganda that all the people were mistaken about the war, only indicates that the old system is still working. The story of the thousands of Russians hurried across America to the Western front was untrue. The Angels of Mons is a war imagination that will live, but has not been proved. The lopping off of children's hands in Belgium is unproved. But the *Lusitania* is not a fable; the *Lusitania* medal struck in Germany is not a myth; the Hymn of Hate is not a vain imagination; poison gas is not expunged from the record, and Edith Cavell is still dead. The reversal of the "cadaver" story and the "contemptible" report is not sufficient to affect the facts of the war.

Someone should proceed to a history of the failure of propaganda in the war, for as a matter of fact that is the only way to describe it, at least in civilized countries. No hatred was engendered in America. Very early in the war all England set itself against the atrocity rumors. England had Belgians by the hundred thousand camping there, the horrors of the German invasion were sufficiently visible and did not require the fantastic trimmings of

atrocity stories. France knew at first hand and needed no propaganda. The failure of propaganda should be studied. And this attempt to whitewash the war by showing how baseless were "cadaver" and "contemptible" is another kind of propaganda, headed for the same failure.

## *The Markings in Old Books*

GO TO that old shelf where your school-books stand, impressive but neglected. Thumb them over, reflectively. Take down, perhaps, a volume of Emerson. Let it open where it will and read at random through it, noting the underlinings and marginal notes put there for classroom purposes.

A very intelligent youngster marked this book, you discover. He recognized and pounced upon the best lines of the Sage. He appears to have had full understanding, this other self now a stranger to you.

A whimsical notion, but in looking backward it seems to you that you must have been stopped at some frontier line between youth and maturity while the agents for an all-powerful espionage system scrubbed you with lemon juice, removing the invisible writings a growing understanding had inscribed. And then that you have gone onward, as smoothly blank as the theoretical "wax tablet" of the psychologist.

For here before you, simply stated, are truths you were ten or fifteen stumbling years learning. You had them once—the markings show that—and they would have saved you many an error, pointed out many a short-cut, had you remembered; but some dumb notion that school and books have nothing to do with life and living caused you to cast them out.

Well, that is over and done with; but is there any way in which we can help our children carry any of these helpful things across the frontier?

## *"Wet" Money From Abroad?*

"PUSSYFOOT" JOHNSON may be right in saying that the anti-prohibition agitation in the United States is being maintained by European interests. When the United States went dry, it rocked the liquor business the whole world round. Even now there is more about the "failure" of prohibition in British journals than in all the "wet" newspapers of the United States. American visitors are constantly interviewed and when a "wet" is found, his testimony is painted on the skies. Yet the consensus of returning British visitors from America is that the thing works and that liquor smuggling has greatly lowered Britain in American esteem.

If Prohibition is as inefficient as the "wets" say it is, why do they wish it abolished or modified? Their profits are surely greater under a non-enforced law. But if Prohibition is efficient, and if as shown in State after State, and test vote after test vote, the country is unchangeably dry, why does the "wet" propaganda continue? Does any "wet" propagandist honestly expect that the United States will ever be "wet" again?

Then why the continued hue and cry? Probably "Pussyfoot" Johnson has the clue. The example of the "dry" United States is exercising a mighty influence on Europe. There is a silent change of attitude toward liquor. Who would have forecast, even five years ago, that the city of Glasgow would abolish liquor at its official functions? Yet that has come to pass. "The Business" is not so respectable as it once was. When a great lord recently arose and said that "whisky won the war" because the by-products of the distilleries went into the munition shops and also made yeast for bakers, it was promptly pointed out that America, without whisky for munitions or yeast, played no mean part in the matter.

If the "Trade" could get rid of that constant reference of America, it would be vastly worth while. Worth enough to pay gold into the American "wet" campaign, anyway.

## *A Professor Says It*

INFINITE satisfaction is reflected when any competent person gets something "off his chest." One feels that the quintessence of experience, emotion and wisdom is then being expressed. When Colonel Mitchell says what he thinks about his superiors, when Wilson said what he thought of Bryan—indeed, when any personal truth squeezes through the joints in our protective armor of make-believe, it is refreshing,even if not permanently uplifting.

Just see how it works.

Dr. J. B. Finley, upon surrender of his professorship at the University of California to become dean of the University of Mexico, left these parting thrusts for American colleges: "Our nation probably will be saved, for a few years at least, by the young men who cannot go to a college or a university . . . . A master of arts or a doctor of philosophy is now a boy whose parents have enough money to keep him in college until the professors are tired of looking at him."

That was certainly a stinger, as the boys say. It is as frank an opinion of the student as some students' opinions of the professors have been. And to a certain extent it is true, but not wholly. True enough, however, to give a taste of salt. Maybe the day will come when men of mind may be as strong to forego college as pink teas, golf or dandyism.

# Hooked Rugs Have Come Back to Stay

By ELLA SHANNON BOWLES

THE day of "picking up" early American antiques for "a song" is a thing of the past, and collectors, dealers and gift shop owners have explored back-country villages and grass-grown lanes, seeking the quaint "hooked," "drawn-in," or "pulled" rugs (and these are all one and the same thing).

There is real adventure in collecting these products of an old-time handicraft, and, if the mania once strikes you, you can't stop. Genuine, well-made, hooked rugs, if the designs and colorings are pleasing, and the vintage old, bring large prices; but once in a while, you may have the good luck to find one tucked away in somebody's attic.

What are some of the things one should know to collect hooked rugs intelligently?

I suppose that the first thing is age, and that in itself is a much-discussed question. Some authorities claim that these rugs are modern, relatively speaking. Others say that hooked rugs were made before the Revolutionary War. One rule is to examine the foundation material. If it is of the old homespun variety, the rug is no doubt old, unless some thrifty housewife, of a later period, unearthed a piece of old-time material in the garret, and used it as the foundation for her rug. One thing we do know: the women of New England, Nova Scotia, the Provinces, New York and Pennsylvania and some parts of the South, made their rugs, not only to use up bits of woolen materials and as coverings for their painted floors, but also to give expression to their creative instincts. The making of hooked rugs reached its height in the period just following the Civil War, but many of the products of this time were of unpleasing designs and crudely colored.

Most hooked rugs were rectangular in shape; sometimes one was square: quite often an oval or round rug was seen. Octagonal and hexagonal rugs were occasionally made. The so-called "door-rug" or "half-rug," serving its purpose before one's door, was commonly seen just after the Civil War. Those of you who love Rebecca, the whimsical child heroine created by Kate Douglas Wiggin, may recall one of these rugs, described in *More Chronicles of Rebecca*.

"Rebecca could see the Cames' brown farmhouse from Mrs. Baxter's sitting-room window. The little-traveled road with strips of tufted green between the wheel tracks curled dustily up to the very doorstep and inside the screen door of pink mosquito netting was a wonderful drawn-in rug, shaped like a half pie, with

'Welcome' in saffron letters on a green ground."

Early hooked rugs varied in size from those of eighteen by twenty-four inches in size to rugs large enough nearly to cover the floor of a small room. I have seen one carpet. It was made of squares of black flannel. A nosegay of bright flowers was "pulled-in" in the center of each square, and the squares were set between strips of "hit-or-miss," drawn in with, one wonders, how many hours of tedious work!

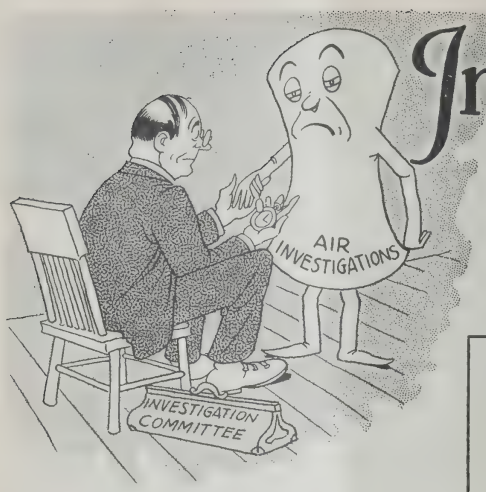
Some of the old-time color schemes were crude and garish; others showed the work of true artists. The dyes of grandmother's day, made of barks and flowers and herbs, had a way, unknown today, of holding their colors, so unless a rug was used commonly it did not gain that mellowness of tone so greatly desired by discriminating collectors. The matter of color is one way of telling age, for some of the old dyes, especially "butternut brown," cannot be mistaken.

Historical designs and landscape designs rank first in value. Village greens, stagecoaches, fields, with a bit of woodland and a fence, houses, ships—all contribute to the decorations of rugs. The laying of the Atlantic cable which left its imprint on Sandwich glass and other products of American handicrafts influenced certain border designs in hooked rugs. Environment was often a factor in designs. Along the coast you will find rugs that show ships, sails, shells and seaweeds.

The conventional patterns were perhaps the most common. It was so easy to "mark off" a design with a brick, a saucer, or a plate, or to draw squares and diamonds upon the burlap backgrounds! Nova Scotia contributed the shell pattern; Maine the rainbow rug; while the "hit-or-miss" rug was made in all localities.

Animal, bird and fowl patterns were quaint and amusing. I know of a famous journalist who delights in collecting rugs that are adorned with stiff-legged horses, queer barnyard fowl, impossible cows, dogs that resemble pigs, and snub-nosed kittens! I have seen parrots and peacocks used in rug designs. Once in a Central New Hampshire town, I was shown a strange animal whose proud owner assured me was a lion!

But loveliest of all the old rug patterns were the floral designs. Sometimes realistic wreaths and sprays, composed of the old-time favorites of Grandma's garden, were hooked-in upon the burlap background. Sometimes scrolls were used, with flowers, in a semi-conventional arrangement. A wreath of flowers in the center, with corner motifs of 'posies,' was a popular design. Autumn leaves, too, were frequently worked in their natural colorings. A widely known collector highly prizes an antique rug with a simple pattern of pansies upon a soft background.



There is one problem that often confronts the collector of old hooked rugs: that of repairing them. If you can afford it, send them to an expert for the skillful touches necessary to restore them. If you can't, find some woman who does careful needlework, and let her pull in the frayed places with soft-toned knitting wools. In nine cases out of ten, if you pick up your rug yourself at a country auction, you will need to send it to the cleaner. However, I have known people to wash hooked rugs with lukewarm water and soap flakes.

After you have collected hooked rugs, what are you going to do with them? The answer is obvious: use them, taking care, of course, that they harmonize in every way with your furnishings and hangings. But, if you think your rugs too valuable to be walked upon, arrange them as wall decorations. They are both artistic and unusual.

Yes, there is joy, and adventure, too, in collecting these specimens of an old-time handicraft, even if you do not gain many trophies. If you have an open heart and love people, you will gain innumerable pleasures that cannot be seen by the naked eye. Let me quote from one of my favorite books, *Colonial Lighting*, by Arthur H. Hayward. His words about collecting old lamps may well be applied to rugs:

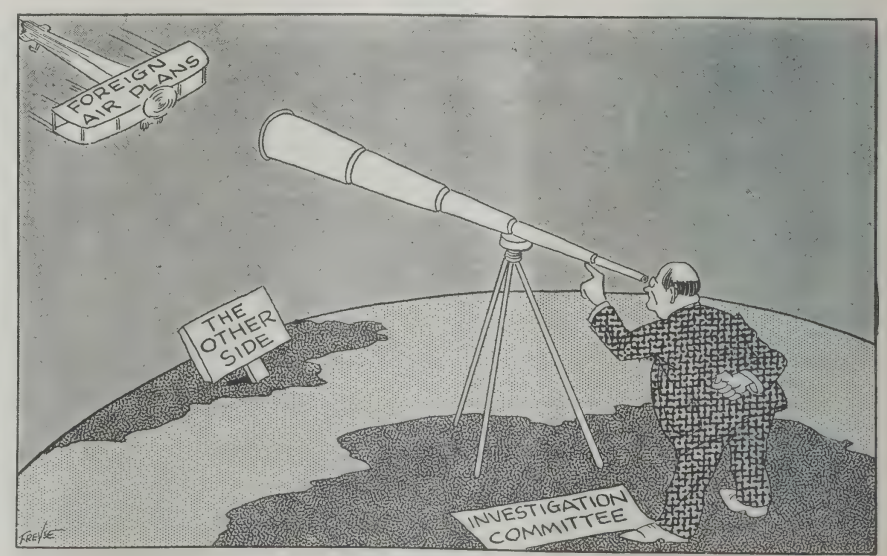
"One of the really lovely phases of collecting is the meeting with some old person who has lived the life of which these lamps and candlesticks are but a symbol. Upon the common ground of reverence and affection for that gone but not forgotten life, such a person will open the gates of memory and allow remembrances of childhood happenings and deeds of later years to sweep over them and you. Better than modern book and magazine are some of the events of their young days coming in homely fashion from faded lips."

# Investigating the Air Investigations

By E. B. JOHNS

Army and Navy are poor publicists. Even when they have a good case, they don't get it across. Glib challengers without the facts to sustain them make vast public impression, while solid Army and Navy facts are not accorded even back-page space in the newspapers. When an Army or Navy officer speaks, it is called "militarism." When an "outsider wanting in" speaks, it is noble discovery, epochal courage.

EIGHT Congressional committees have conducted annual investigations of the Air Service beginning in 1920. They are the Senate military and Naval committees and the House military and naval committees. With the advent of the budget, organization in the Senate and House, the War Department and Navy Department subcommittees of the Senate committee on appropriations, and the War Department and Navy Department subcommittees on appropriations were created. Every session has seen some bill before the military and naval committees of both Houses which has resulted in the hearings on aviation. The subcommittees of the appropriations committees have invariably gone into the subject at great length when the items for the Air Service were reached. If all of the testimony that has been given before these committees were collected, it would fill a good-sized library.



But this has not satisfied the separate Air Service partisans. They succeeded in having the Lampert committee appointed. This was "a select committee of inquiry into the operations of a united Air Service." The testimony consists of six volumes containing more than four thousand pages. A great proportion of the testimony was furnished by General Mitchell. There were a number of other special investigations by Congressional committees, but the Lampert committee broke the record. In the face of this, there is talk of further investigations at the approaching session. One member of Congress is quoted as saying that "Congress should have an investigation of its own and not accept the recommendations of the Morrow board."

As extensive as they appear, the Congressional investigations of the air problem, they are small affairs compared with those that have been conducted by the Executive branch of the Government. President Coolidge has ordered two special investigations. The Morrow board is the second presidential board that has conducted an investigation of aviation. At the President's direction, the Secretary of Navy ordered a special board to investigate the relations of the Air Service to the Navy.

This board met on September 30, 1924, and continued in session until December 4. It called seventy-four witnesses, not neglecting Colonel William Mitchell himself. All the authorities on aviation, not only from the Army and Navy but from civil life, were asked to appear before the special board. The testimony was spread out over 1,821 pages. Much of it was confidential and has not been printed. Secretary Wilbur, after he had read not only the testimony before the Navy special board but the long hearings before the Lampert Congressional board, can really be excused for his expression of doubt as to the necessity of further investigations when the Morrow board was suggested. The Mitchell adherents charge that Secretary Wilbur was attempting to conceal something but the Secretary could not understand what there was to conceal when he had spent a large part of the summer in reading the first presidential board's testimony and the Lampert hearings.

No publicity had ever been given to it but the War Department General Staff and the General Board of the Navy have, since 1915, been conducting annual investigations of the air problem. I have had the privilege of examining the records both of the War College and the Navy General Board. The technical name for a War College and a General Board investigation is "a study," but greater care is exercised in conducting their so-called studies than the public investigations of Congress or special boards.

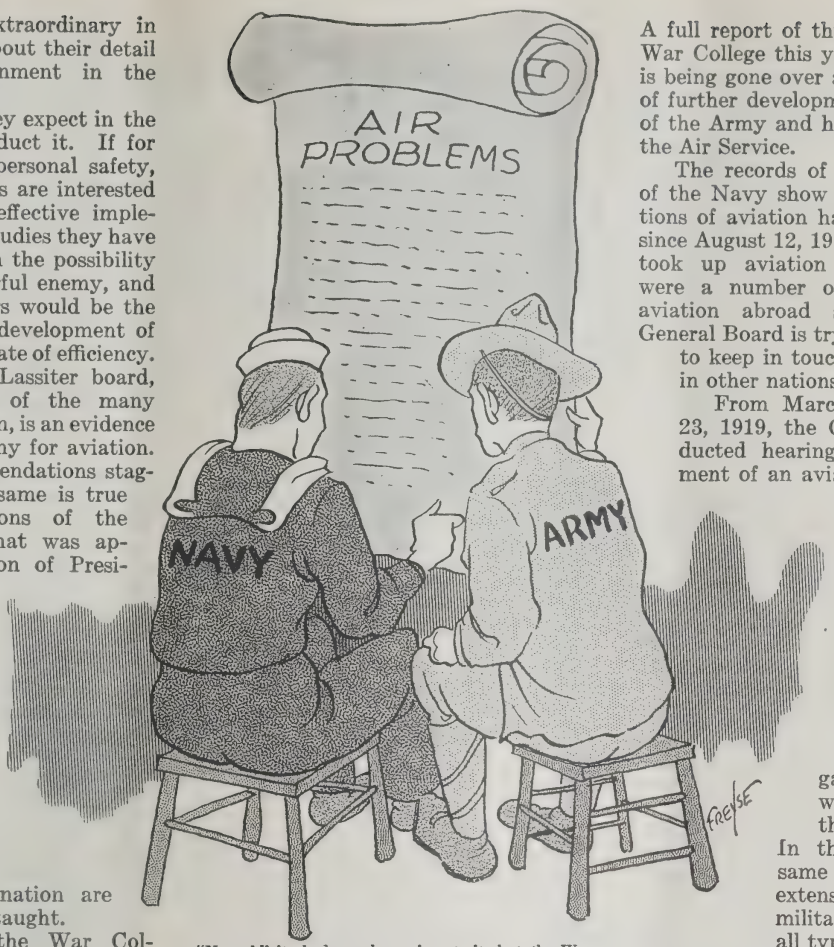
It should be borne in mind that Army and Navy officers from the time they enter the service are indoctrinated with the idea that they are responsible for the defense of the nation. Both in the War College and in the General Board there is on duty a selected group of Army and Navy officers. There

"There were a number of investigations of aviation abroad."

must be something extraordinary in their record to bring about their detail to the highest assignment in the services.

Aside from this, they expect in the event of a war to conduct it. If for no other reason than personal safety, Army and Navy officers are interested in securing the most effective implement in war. In their studies they have continually before them the possibility of battles with a powerful enemy, and Army and Navy officers would be the last to discourage the development of aviation to its highest state of efficiency.

The report of the Lassiter board, which conducted one of the many investigations of aviation, is an evidence of the desire of the Army for aviation. The cost of its recommendations staggered Congress. The same is true of the recommendations of the special naval board that was appointed at the direction of President Coolidge.



The Army air investigations are really conducted at two places. At the Fort Leavenworth School, the preliminary investigations as they affect units of the Army up to the division and corps. At the War College, the larger problems of the defense of the entire nation are taken up, studied, and taught.

For instance, at the War College, annually, there is an investigation of the effect of improvements in types of planes on air tactics and the strategy of the Army. In these investigations, an effort is made to reach a definite conclusion which is put into effect in the plans of the War Department for the organization and training of the Army. The conclusion was reached at the War College that any clear tactical doctrine with respect to the use of airplanes must be built around some particular type of plane that will be in use and will be put into quantity production when war starts. The War College is more interested in the development of the standard airplane than some freak or extraordinary machine.

An examination of the records of the War College shows clearly that every phase of aviation is being thoroughly studied as new inventions and improvements are developed.

Under the head of the value of air power as an element of national defense, the following subjects were investigated:

Mobility of aircraft; new types of planes; employment of air force by G. H. Q.; power of bombardment aviation; meaning of control of the air; employment of reconnaissance aviation; employment of air power in coast defense operations; anti-aircraft artillery; relation of civil aëronautics to military aëronautics.

"No publicity had ever been given to it, but the War Department General Staff and General Board of the Navy have been conducting annual investigations."

One of the most interesting investigations which I examined was the employment of the reduced air strength. In this an effort was made to work out plans as to how the existing strength upon the outbreak of war would be used until production was sufficiently speeded up to give the Army the planes that it would require. While it recalls in a manner the picture at the beginning of the World War, it was demonstrated that even with our limited capacity for production at present, we are far in advance of the conditions that existed in 1917.

At the close of each school year, the War College has what it calls field exercises. Last year, the problem made prominent the use of the Air Service. In this the Navy was brought in as the attack was assumed on the Atlantic Coast. Field exercises consisted of reconnaissance where actual problems of determining the site of airdromes and landing fields were based upon the present radius of action of existing types of airplanes. It was conducted at Camp Dix where the War College personnel was joined with that from the Signal Corps and the Air Service school of Langley Field. Airplanes participated and officers from the Army War College were taken up in airplanes as if in actual battle for the purpose of working out the problem. A full report of this was made to the War College this year and the subject is being gone over again with the view of further development of the strategy of the Army and how it is affected by the Air Service.

The records of the General Board of the Navy show that 110 investigations of aviation have been conducted since August 12, 1915, when the Navy took up aviation seriously. There were a number of investigations of aviation abroad showing that the General Board is trying conscientiously to keep in touch with the progress in other nations.

From March 5, 1919, to May 23, 1919, the General Board conducted hearings on the development of an aviation policy for the United States Navy. More than six years ago the General Board spent more than two months hearing testimony and recommendations on this subject. It was a more extended investigation than that that was conducted by the Morrow board. In the autumn of the same year, it conducted extensive hearings on the military characteristics of all types of heavier-than-air and lighter-than-air craft.

Among other subjects that have been thoroughly investigated by the General Board are:

Air stations; use of aircraft on surface ships; construction of rigid airships abroad; aviation needs for the future; characteristics of aircraft carriers; aviation activities in the Hawaiian Islands; airplanes to be carried on submarines; anti-aircraft guns for battleships; gas masks for aviators.

Aside from all these activities in the Army and Navy, there is the presidential board covering scientific or technical matters relating to aëronautics, and under its instructions institutes a searching investigation not only for the Army and Navy but "any individual, firm, association, or corporation within the United States." It is known as the "National Advisory Committee for Aëronautics" and was established by an Act of Congress approved by the President of the United States on June 14, 1915.

All of the Army and Navy air investigations are coördinated to the United States aëronautical joint board. This board is headed by the Chief of Staff of the Army and the Chief of Naval Operations of the Navy. General Pershing heads the Army group and Admiral Eberle the Navy group. It is composed, aside from the members of the General Staff and officers on duty with Naval Operations, (*Concluded on page 23*)

# When a Storm Struck "Buffalo Bill's" Show

## It Was Then That It Became a Wilder West Than Anyone Ever Paid to See

By IRVING R. BACON
ILLUSTRATED BY THE AUTHOR
PART II.

OLD "Iron Tail," one of the Indian Chiefs, was a favorite with the Colonel and he happened around frequently, never going away without a cigar. The yarns they spun together proved very amusing to guests fortunate enough to be present. One was of an elk hunt on which "Iron Tail" accompanied the Colonel. It seems that they made an early start, tracking the elk for six or seven hours until they became hungry and very cold. ("Iron Tail" always shivered and bore a pained expression at this stage of the story.) It happened that the Colonel had surreptitiously put a bottle into his saddlebag, so he went to his horse and secured it. "Iron Tail" was delighted at seeing the bottle, and naturally expected a big drink of whisky. The Colonel unscrewed the top of the flask, poured out the cover full and handed it to him. The Indian with a pleased expression hastily took a gulp; but instantly spat it out, dropped the cup and yelled, "Hot! Hot!" There was no fire and how the coffee could be hot was a mystery to "Iron Tail." He got real "fire water" and for many a day he couldn't figure out the workings of the thermos bottle.

In every town where the show stopped, many visitors attempted to meet Colonel Cody. During his spare time he was generally hard at work writing, even between acts, there being no such word as "procrastination" in his dictionary. Old friends were welcome always; but, when some stranger whose grandfather knew him or who perhaps had rubbed elbows or even shaken hands with him on some remote occasion attempted to refresh his memory, he was liable to lose all patience.

On such occasions, however, he usually wrote out a double pass which partly atoned for wounded pride. However, old acquaintances, such as scouts, plainsmen and trappers, always got a cordial reception.

Two notable events occurred during the tour through Iowa. At Davenport, the citizens presented him with a handsome loving cup. The presentation ceremony took place immediately after "Buffalo Bill" made his appearance in the arena. As the old scout drew rein and doffed his sombrero, with a background of the arena filled with riders from all corners of the world, the speaker for the occasion stepped from the vast audience and commenced an impassioned address. I have never seen a man of more noble aspect than that which Colonel Cody presented as he listened with head and shoulders thrown back, the sun glinting over his white flowing hair. There he sat astride his beautiful and handsomely equipped white charger, an inspiration for painter and sculptor.

The following day at Clinton, he was presented with another beautiful loving cup, on which were inscribed the names of forty citizens. Little girls dressed in white stood beside the flag-covered stand bearing the cup, and took part in the exercises.

The first night that I spent with the show, after the performance was over, I became concerned as to how I could keep from being lost in the confusion. I had been so absorbed in all the strange things happening around me that I had forgotten to get instructions. However, I found Colonel Cody, who made arrangements for my welfare. Very shortly I found myself mounted on a cavalry horse. Just ahead of us was the string of buckers, and behind the Arabs. This great lot of men and

"Grazing in the arena was the herd of bison guarded by cowboys who would lasso a buffalo that wandered too far."

"That they are genuine is easily to be seen by their lounging attitudes."

horses—bunched in numbered lots—started for the train in regular order. As we moved out two abreast, guided by the fitful torchlights that marked the route through the city at intervals, we passed through enough noise and excitement to scare an ordinary horse out of the country. Crowds of people struggled around us; long strings of electric cars clanged their gongs, and whizzing automobiles tooted their horns, turning the night into bedlam; and yet our cavalcade moved steadily along without a suggestion of nervousness from the horses.

It was a weird and fascinating sight, this loading at midnight, with the flare of torches lighting up the scene, silhouetting the forms of the men as they struggled and shouted at their work. On a separate track stood the long line of sleeping cars. One of these was pointed out to me as that of Colonel Cody. As I entered, the cook escorted me to my quarters, a large and comfortable stateroom, with berth, lounge, easy chairs, clothes closets and toilet facilities. Back of it was the bathroom, cook's room, and kitchen. The other end of the car belonged to Colonel Cody and in the center was the dining room or parlor, handsomely furnished.

I found the Colonel and his grandson awaiting me, and shortly afterward we sat down to a late luncheon. This fourth meal of the day was made up of fried chicken, pastry, fruits and soft drinks.

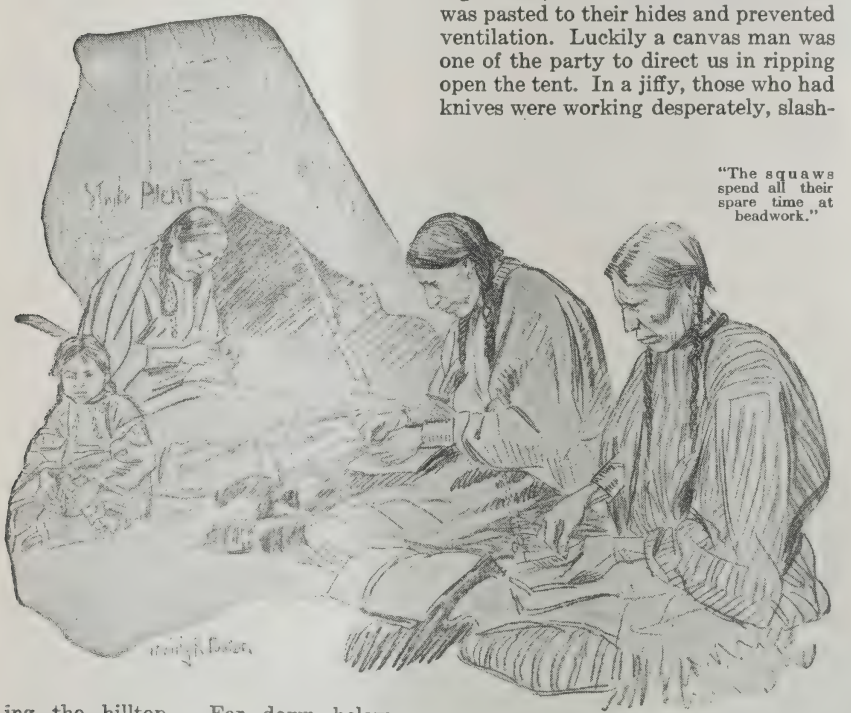
Very few cities permit performances on Sunday, so it was a day of rest after the tents were up. Colonel Cody remained in his car, writing letters and reading. However, many of the show people made this a regular gala day, dressed up in their best and put up at a hotel. In contrast the Indians kept pretty close to their tepees, avoiding as much as possible the gaze of the curious crowds which thronged the grounds. In the evening they were to indulge in their dances and singing. Far into the night the weird trill of the squaws and the "Hi-yei-yeis" of the bucks accompanied the pulsating throb of the drum.

Because of the leisure Sunday afforded to those particular types I was studying, I remained in camp all day, making Colonel Cody's tent my headquarters. Saturday had been pay day, and those who had gambling propensities drew to cover, some in rooms in the city hotels and others in secluded spots on the grounds. At any rate, if one had any craving to gamble, it was not difficult to get into a game. Some one had rigged up a gambling tent. Here on a long table, Negroes, cowboys, Mexicans and various Europeans and Asiatics rolled the merry bones in the game of "crap." At tables sat the real gamblers playing poker. Only white men, as they called themselves, played at one table, while at the others a mixed crowd sat. A prominent player at one of these was an Indian. He sat as stolid and expressionless as a statue—no one could read his emotions, I'm sure—and by the stack before him he seemed to be in luck.

"The Indian dropped the cup and yelled, 'Hot! Hot!'"

Late in the evening I retired to the Colonel's tent. The secretary and orderly were fast asleep in the front compartment. After what seemed but a brief nap I was awakened by the boom of a storm. A fresh wind had sprung up; and, as I listened to the roll of distant thunder, I noticed that the wind was picking up. I was now wide awake and had a feeling of apprehension. In threatening weather Colonel Cody was wont to fret and worry in a way that seemed

so strange, that I took the trouble to inquire of it; and found that his anxiety was due to his fear of a possible "blow down."



To have this tented city swept flat would be a dreadful thing indeed. People and animals might be killed or hurt and much property destroyed. But this night "Buffalo Bill" and most of the show people were quietly sleeping in the berths on the train, lying on the tracks far down in the valley below. Only a few watchmen were on guard, those others on the lot being fast asleep in tent or wagon.

My apprehension now turned into alarm, for the gale outside was sweeping the tent with tremendous force. The back end and top were bellying in and the guy ropes were tugging at the stakes in a manner that threatened to bring the whole thing down. So I hurriedly put on my clothing, slipped on my raincoat in the dark, and awakened the boys. My first impulse was to reach the open and get away from possible missiles such as flying stakes and poles, so I took refuge behind a great wagon.

Sheets of blinding rain were sweeping the hilltop. Far down below, when the lightning flashed, I could see that the air was full of dust and flying particles. The big top surrounding the arena was being whipped so by the wind that it resembled the billows of a storm-swept ocean. Suddenly a rent appeared in the eastern side—it was the beginning of a great gap—and then with a roar the whole side went down, seat planks, poles and rigging scattering off far to the lee like so many chips.

Dan and Billy now came out and we all went to work at taking up the slack on the guy ropes of the Colonel's tent. By the time we finished we were soaking wet, for the rain was driven up our sleeves and down our necks, drenching us despite our raincoats. A watchman with a lantern and two other drenched men sought refuge in our tent. They were in their stockinged feet and only partially clad. Their frightened eyes, their shivering and teeth chattering, disgusted me, for I love a storm. So I again went out, this time to find out how the rest of the show was faring. Presently I came upon a group of scantily clad and rain-soaked men. They, too, were braving the storm in the open as the safest place. A Cossack ran by, hit a stake and, falling with a cry of terror, yelled, "Me God, me die." An Arab camel tender was dragged out from under a wagon, where he had buried his head in a pile of hay, ostrich fashion. Tents were flattened down on all sides. Suddenly it occurred to us that there were others beside human beings who were in danger of their lives.

There before us was the horse tent, lying flat, with the exception of solid looking mounds. These meant smothering horses, for the rain-soaked canvas was pasted to their hides and prevented ventilation. Luckily a canvas man was one of the party to direct us in ripping open the tent. In a jiffy, those who had knives were working desperately, slashing the lacings and in fact anything that balked us in reaching the inside. Once under the canvas, we made a veritable tunnel by holding up the canvas until we reached the horses, when the halter ropes were cut and the animals passed out as fast as released. In this manner we worked our way along, making our tunnel more permanent by propping it up in places with side poles, until it resembled the chambers of a mine. So little room was there, that the horses had to be squeezed by us and, if any had taken a notion to cut up, we could have done nothing to protect ourselves. But none of the rescuers stopped to think of this, for buckers, mules, bronchos, fallen horses—some under poles which had to be literally dragged out—all alike were yanked out into the open, until every horse was rescued. Once outside, they were led into what was left of the arena.

"The squaws spend all their spare time at beadwork."

Now a new danger appeared, neighing stallions and wild reginals began to fight and raise havoc until a stampede was started. Deafening crashes of thunder and blinding flashes of lightning added to the confusion; but the boys, regardless of the danger of being trampled under hoof by the terrified beasts as they galloped hither and thither in the dark, headed them off time and again.

Up till now we had been depending on the lightning for illumination as there were only a couple of lanterns and a torch in the party; but at last we got a carbon light working. The ground was studded with stakes and nearly all of us had come to grief by barking our shins on them. Luckily the elephants stood quietly after being taken out; if they had joined in the stampede, we all might have lost our heads. In the dark it was hard to recognize the saddle horses, and one man almost got into trouble by trying to saddle "High Tower," the most vicious bucker in the string. Presently two men were mounted and they greatly helped in rounding up the horses. Picket ropes were put up in the arena and to those we fastened the animals as fast as caught. There was much hard work and danger attached to this task, too; but the boys stuck to the job until it was finished, even though some of them were barefooted and all of them soaked to the skin.

Further sleep was now out of the question, but some of the boys started bonfires, around the cheerful light and heat of which the cold and wet ones gathered.

Early in the morning I returned to the car to change my clothing and get a hearty breakfast. When the Colonel learned that no one had been seriously hurt and no stock was lost, he was in cheerful mood. A great many persons thought there would be no show that day; but when it was light enough to photograph, not enough of the wreck remained to make a decent descriptive picture. Gangs of carpenters got ready to splice and make new poles, canvas men took the ripped tent in hand, and the patching and splicing went on so rapidly that by noon everything was up again but the top of the east side of the arena. Some of the directors were for putting up only a portion of the seats, but Colonel Cody took a more optimistic view and ordered them all in place. It was well that he did, for the afternoon performance was crowded beyond seating capacity, just as it had been every day since I came.

# Is It Christmas or "Xmas" to You?

## This May Have Some Bearing on the Buying and Giving of Your Gifts

By CLARA E. PUTNAM

THREE Wise Women went Xmas shopping. They were cold, tired, and loaded down with packages.

"Have you everything?" asked the first.

The second Wise Woman's voice shook wearily. "Everything except something for the baby. I don't know what to get for him."

"Neither do I," agreed the third. "This Xmas shopping gets to be more of a bore every year!"

The crowd swept them from sight through an open doorway. Half an hour later they emerged, disheveled, but triumphant.

The first Wise Woman held up a box. "It's to hold neckties. Maybe he won't like it but he's so little that I don't think he'll much care."

"How pretty!" The second Wise Woman held up her purchase. "Of course he can't use it, but his mother can."

"And I got this," put in the third Wise Woman.

"He can't use it now, but maybe he can when he grows up. I hope he learns to smoke!"

And that night, when the Star shone, and the Three Wise Men took their journey toward the East, they carried with them a necktie box, an egg-beater, and a silver cigaret case to lay at the feet of the baby King.

* * *

There are Xmas gifts and Christmas gifts. There are those which literally involve the X quantity, meaning how much the other person will give you and how little you dare give him in return. There are real Christmas gifts which are prompted by the spirit of love that came into the world with the evening and the morning of the first day and found its culmination in the birth of the little Child Jesus.

Behind the counter of a department store during this festive season try to classify your customers as Christmas shoppers or Xmas shoppers.

A flushed-cheeked little woman with her burly husband. He handles the toys as if he were an overgrown small boy himself. You can mentally picture him down on all fours on Christmas morning trying to show a small Jimmy or Jack just how to run that train of cars. His wife seems to catch a glimpse of the same scene; you can tell it by the laugh in her eyes. Christmas shoppers!

Another couple. The woman has a worried pucker in her forehead. The man seems resigned.

"Henry, what can I get Aunt Mary that I didn't get her last year and she didn't get me and doesn't look cheap and doesn't cost more than two dollars and—"

An old man and his granddaughter, about fifteen, poorly dressed in an old-fashioned way. The man equally shabby.

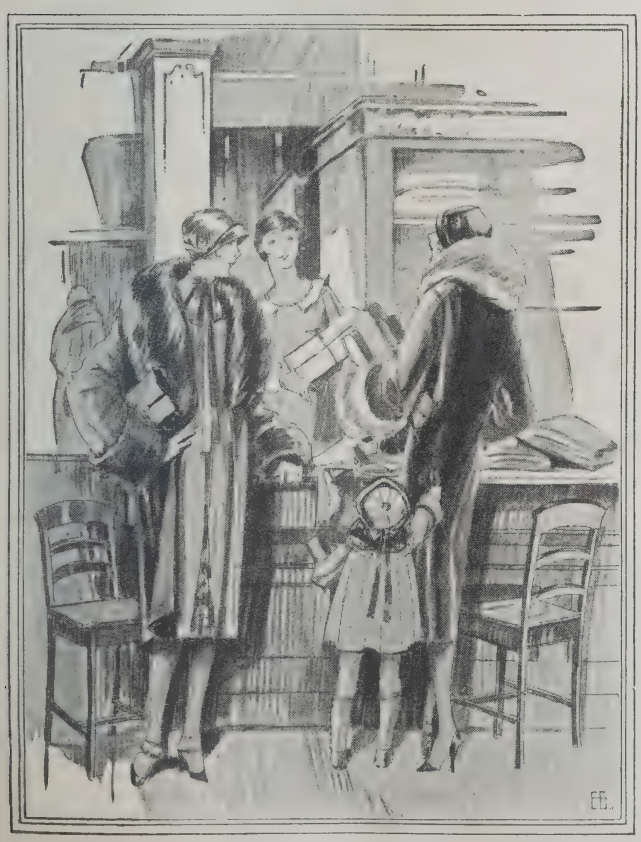
"Now you go stand by the door, Gran'dad. Turn your back an' don't you look!" the girl orders.

"Now it's my turn," he says, coming back. "Mind, Mary, if you peek Santa won't come!"

What matter if neither of their gifts costs more than a quarter? What matter if they are homely, serviceable things that must be bought later, anyway?

Wouldn't you like to go shopping with Charles Dickens during this Christmas season? Wouldn't he revel in our holiday crowds? Wouldn't he poke fun at them, and sympathize with them—and wouldn't he love them!

There is Xmas shopping and Christmas shopping. If there is one present that you sigh and say you've *got* to buy, *that* is one present you'd better *not* buy if you value the Christmas spirit. You can go as far as your pocketbook will let you, if you give for the pure fun and joy of giving, and your Christmas is safe for another year.



# Women of No Occupation

(*Concluded from page 7*)

anyhow. But suppose you figure what you are making a month, even at the rates you would pay servants for the work you do. Add up what it would cost to replace *YOU*, from a standpoint of labor, in your home. It will not add to your pocketbook, but it will add to your feeling of importance.

Those of us who are working at home have money returns, and we have returns greater than money. We have learned that the spending of money is just as important as the earning of money, and our financial worth is at least as great as that of our sisters working downtown.

We are learning that efficient management of a home is good business training, and the years at home with babies are not lost years, for those who want later to go on with outside work.

"We have learned that the spending of money is just as important as the earning of money."

We are getting a fairly accurate idea of our own worth, and it is really up to you to recognize it. We have full control of live little minds, responsibility for sturdy little bodies. The woman-who-posed-as-a-martyr has gone out of style, so you are not bored with complaints, but her descendants are carrying on her work, without her attitude.

For even a census-taker can't make us forget that we are people of importance, we women of no occupations.

# Where are the Americans? Down South?

Where Dix River joins the Kentucky River, at High Bridge, Kentucky.

## Have the Constructive American Stocks United Below the Mason and Dixon's Line?

By HARRY E. BARNET

THE South is saturated with American people, and with American traits. This is the full answer to the question recently put by the editor of a prominent northern newspaper.

"Tell me," he queried, "where are the Americans?

"I mean," he went on, "that this was a region wholly inhabited by people of an old American stock. They looked it. They acted it. The air of the region was typically American.

"Suddenly, the American type began to fade. That was but lately. The type is getting scarce. Alien casts of countenance are predominating. Alien thought seems about to rule the roost. Our common moralities are tinged deeper each year with foreign dishonesties. And the same thing is true of other regions that were like this one. I've just come back from a trip through a great many of them, and in all of them the question is, 'Where are the Americans?' "

There are, it is safe to say, more people of the divers old American stocks in the South today than you can scare up in any other section of the country. The South has its own. People of the other old national strains have been flocking there from everywhere. They're still at it. You can make a list of the constructive American stocks mentioned in *Winning of the West*, and other histories, and find an abundance of each of them below the Mason and Dixon's line.

These stocks are mixing up. There's no great herding to themselves of people of a particular stock. Nor is there bunching of people from the same sections of the country. Mingled with the courtliness and grace handed on from Colonial French and Spanish days in New Orleans, for instance, you find crisp New Yorkishness—it's genuinely American. The South is shot through, for another instance, with the clans of those who rushed into Oklahoma about forty years ago, and turned its expanses into something over which to crow. A rugged—and powerful—element is injected into the mass by the migration of mountaineers into the lowlands. Illinois people are plentiful among the picturesque Acadians in the Bayou Teche country.

The nasal twang of New England often hits your ears down around Mobile—something that is not exactly new, however. There was strong infiltration of New England ways—even of architectural ideas—in the Old South. Among others, Natchez was one of its traditional cities. Through the texture of Natchez there has always been a stout New England thread. But it never had a touch of harshness. It contributed its substance to the texture; and it took on the sort of softness that was a part of the charm of the Old South. There was happy blending of two elements.

Happy blending by wholesale is what is going on in the South nowadays. Each old American stock is contributing the best it has to the upbuilding of something distinct as the American nation. The whole affair is a piece of history making which to observe is like spending so much time three or four centuries back.

For stripped of the accidents of this age, and down to bare realities, in all that they do, as well as in the way they do it, these people are likenesses of their forbears. Outwardly, the things and problems to be dealt with are different. But fundamentally they're like the trio that failed to feaze the originals of the old American stocks, without regard to whether they were northern, southern, western or eastern.

Here is the idea. The old-timers faced a lot of dangerous things. They cleared out the most of them. Some were left over. Malaria in Mississippi, among others. Up to a short time ago, the disease stood higher in that state for destructiveness to human life, and hampering of agriculture and industry, than ever yellow fever stood in its palmiest outbreaks. The latter flared, slayed, raised the devil's own fuss—and went away. Yellow fever was spectacular, and brief. It got attention. Malaria is equally deadly, but it is a slow worker, and quiet. It slayed and disabled, but it failed to

get attention. Consequently, it was neglected, and went on and on, a serious drawback.

"Malaria used to be so common," Harris Dickson says, "that everybody had their chills-and-shakes days. I knew these days of every one of my friends, so I knew when I could find them at work, and when they would be laid up. It was routine. But no one I know has chills-and-shakes days any more. Malaria is almost wiped out."

Anyone can live in Mississippi, and be free from malaria. There has been a recent attack upon it that smacks of the persistency and thoroughness of the frontier breeds, when they put dangerous things to rout. And not in Mississippi alone. One of the reasons why the South is spurting ahead at a great rate is that all of its states have checked the inroads of malaria.

When it comes to spotting and developing native resources, these people of the old American stocks in the South are historical characters over again. Daniel Boone, for instance, had a keen eye for such things. One of his pets was the waterpower possibilities of Dix River in Kentucky! In a spectacular way, it has recently been controlled —and it is furnishing electricity. Cannot you half-imagine that had Boone lived he would have tried out development of the resources he spotted?

At any rate, here is something from which you can draw your own conclusions and comparisons. Small showing of possibilities has ever been made by a considerable body of Southern Negroes. They raised cotton and other crops, and divided them with the landowners in lieu of money rent. The question has always been whether once started, these Negroes could go it alone. If so, the South has a resource that has been wasting, like the waters of Dix River.

About the time its improvement got under way, a man who believed there is something in this class of Negro, bought several thousands of acres in a fertile Southern county that was all but abandoned, because the boll weevil practically put an end to cotton raising there. The land was divided into small plots; comfortable houses were erected on the plots, and the yards were well fenced.

Negroes were selected from the mass—and some were sorry specimens. As nearly as it could be done at the time, each Negro was set up as a planter. He rented the plots for money rent, to be paid for out of the proceeds of his crops. Two acres were allotted for commercial trucking; and two or three additional acres for cotton and corn. Inasmuch as these Negroes were penniless, they went in debt for horses, mules, cows, hogs and poultry.

Monument to memory of Confederate women, Jackson, Mississippi.

In about the same manner that the engineering details were carried out at Dix River, the Negroes were coached to become planters. They had to learn what to them was a new form of agriculture. The first year, three truck crops were raised, one after another. The Negroes received cash money for their crops. Then the cotton crop came along, and the Negroes received cash money for it. Thus, they had cash four times in one year. Furthermore, the Negro got all that was coming to him. He paid his rent. Paid either in full, or nearly so, for his livestock; his debt at the community store, and with but few exceptions these Negroes had money left over.

At one jump, their self-respect perked up. Theretofore, they had been the subjects of some queer deals. "Credit merchants" supplied them for a year at a time, and took over the Negroes' shares of whatever they raised, marketed the crops, and deducted the amounts of indebtedness. Settlements were annual. These merchants had things their own way—the Negroes were ignorant. The story of the "credit merchant" in the South is no sweet tale. If a Negro was lucky, he had a few dollars left out of his crop. The usual thing was that he had nothing—or was still in debt. If he had livestock, it was often taken away from him. The outlook was hopeless.

The Negro was trained to shiftlessness. Although furnished a house, and a garden, he took little interest in either, because he never could own it. If a garden was well fenced against rabbits, and the house porch had a good floor, it was a common thing for the Negroes to rip up the floor and tear the pickets from the fence for firewood, rather than walk fifty feet farther, and chop up a fallen tree. If the Negro gave his cotton crop all of the attention it needed, he still had the biggest part of the year to "jolly around"—loaf, in other words. So he had no work habits. No saving habits. This is but a hasty glance, but it touches the highest spots of a condition that is generally improving—but the effect is still there.

Convinced that there was no trickery about this new enterprise, the Negroes were hopeful with all of the enthusiasm that marks any Negro emotion. They realized the benefits of steady work—and commercial trucking is an all-the-year-round job. They could buy the land they worked—and they're doing this. Some are embarking in animal husbandry. All of them are going it alone. The result is that they're showing amazing possibilities in every direction. They are planters, and they realize their responsibilities. They pridefully show you their neat homes, and gardens, and livestock. Their pride in possession is pitiful. They tell you of their savings in cash. A hereto-

Where Negroes' crops are packed for shipping.

fore almost useless class of people has shown that it can be developed. Of course, it was no easy job.

Alienism is so completely absent in one big area, that you're repeatedly told there, "When we read in the newspapers about what is going on in New York, where even children born in the United States of foreign-born parents are publicly preaching the overthrow of our form of government, and where a committee was appointed to revise our history to meet the ideas of certain foreigners, we can't realize that such things are occurring in our United States. It must be some other country! We've never seen any aliens, and their American born, of that kind in our section. We don't want to see any of them. If they come here, and try such tricks, there'll be no languor about giving them short shrift."

The boast of one of the biggest southern industrial centers is of its freedom from the type of foreign-born one usually associates with industrial centers today.

The South is completely transformed. It is developing faster than any other section of the United States. And this is attributed throughout the South to the fact that Americans are at it, and that they are sticking to American principles that are tried and true. Foreign theories and isms have no show.

The prevailing thought can be summed up in the remark of a young chap, who, with his brother, operates a restaurant in a big southern city.

"We married sisters, and came down here about two years ago," he said. "We made the move to get away from the foreigners. Up in the part of Indiana we came from they were getting too thick to suit us. A good many people we know came South just on that account. They want to raise their children among Americans."

These Negroes two years ago faced a hopeless future. Now they have money laid by.

A lot of places are geographically in the South, but for various reasons—one, the newness of some of them—they never had the appearance and ways of the South. Their look and air was more northern, eastern or western. Now these places are trying to live up to their geography. They are actually moving backward to pick up as many southern traditions, and as much of the something that was the Old South as possible.

Take Birmingham. A bit over fifty years ago it was nothing but land, inclosed by mountains. But the land held within a stone's throw of each other all of the materials for making steel. These minerals were developed. A result is Birmingham, which claims to be the biggest city of its age in the world. It never was of the South. It resembled Pittsburgh—then, Chicago—at times, a western city. People from all of the old southern stocks came there, and helped build the city—and they left their traditions at home, together with heirloom furniture, and old silver.

The city was thoroughly materialistic. So much so that about a dozen years ago, people in Birmingham realized that it was growing into a misfit thing. A lot was heard there about the traditions of other southern cities, but Birmingham had none. People from different parts of the South who were brought up in old-fashioned southern ways wanted their children to see the side of life they knew. So the traditions of various parts of the South, from Virginia to the Mexican Gulf, are being brought in. They are like slips of plants that you stick into fertile soil—if you live in Birmingham you see the growth of these traditions and ways, just as they have been, and are, in any southern city, like Mobile or Richmond.

The materialistic ways are toned down. There's a blend that's difficult to describe. It arouses your enthusiasm. Physically, the city is much like the Old South. The latter wasn't far from being on the order of a huge family.

"I'm a New Yorker, born and reared," is a size-up that carries the idea. "But I've been in Birmingham for several years.

"When I leave for a little trip, I always want to get back between these mountains. I always feel, when I'm away from the city, that I'm only one of a number of sheep—and lost. Here, I feel that I'm protected. It's a peculiar kind of feel—that here I'm part of a big family, gathered into a big room.

In the biggest part of the South, "We're Moving On" means coming out of the atmosphere of the Old South. Some places are laying away old traditions and manners in rosemary, so to speak. Others are blending them with new ways from elsewhere. A few places are chucking the old things out, like you dispose of stuff that has passed its usefulness. Generally speaking, the South is losing its old-time settings. Here and there the result is gaucherie that brings a pang. Now and then, you come across artistry in blending. Yazoo City, Mississippi, holds fast to the charm of other days, and at the same time it has the best of these days and of all regions.

Heretofore, in the South, you had to be vouched for, and have satisfactory ancestry, before you were introduced to the best families. Now the inclination is to accept you, and see if you square up. You're given every social advantage until you prove that you're unworthy. But to get by you must have a pretty good standard of conduct.

You particularly notice the change in state capitals. In the old days, the man who ran for office generally owned many slaves, and a big plantation. He had a fine home, which was a social center. Frequently, he had been an officer in the Confederate army, and a glamour has always hung around these men. In fact, and in fancy, they were heroes. After the war they were land poor. Yet, they tried to hold their own, and keep up appearances. Although their clothes were threadbare, they were heroic figures. When they were elected, they brought their families to the state capitals, and there they maintained the pomp and ceremonies of their offices. They spent all they made maintaining their genuinely high social position. But they contributed little to the real progress of the capitals. Lately, the younger generation has taken charge; and people have come in from other sections of the country. The state capitals are "moving on."

Undoubtedly, the biggest change appears in southern women. Where formerly they were satisfied to go through high school, and a finishing school, now they're going in for higher education and careers. Southern women have objectives, and they attain them. Southern women are preserving the historic things of their regions—and to do this they are heroines, as they always have been, for they often have to do battle with politicians,

and ruthless and ignorant elements in order to prevent vandal destructiveness. In the erection of new buildings they are trying to preserve the southern atmosphere where it will not conflict with progress. A high spot is the tremendous interest that southern women have aroused in culture.

Jackson, Mississippi, is typical of the revolution in the South. The city is growing rapidly, but sanely. There is no frenzy about it. For each $100,000 spent in a commercial and industrial way, an equal amount is spent for a church, a school, a fraternity clubhouse, or like structure. The city is equally developing in each of the five ways necessary to a well-rounded city—industrially, commercially, fraternally, religiously and educationally. Jackson isn't a northern, western, eastern or southern city—it is an American city.

Through all this turnover in the South, you come across sheltered nooks where the Old South still reigns, and you get visualized reflections of that which once was general. Even to the custom of drinking coffee from saucers. A set of dishes in an old home includes glass saucers in which the coffee cups were placed after the regular saucers had been filled, so the drippings would not soil the table linen. And the mistress of the home pines for the days when no one drank a fixed number of cups of coffee each day, "but so many saucerfuls."

Below the Mason and Dixon's line, if a man tells you he will meet you in church, he is not indulging in a bit of slang. He means what he says. In no other section of the country, probably, has there been such a religious awakening—and there is nothing emotional and frothy about it. In one city a contractor has signs upon all of his various works, each sign bearing one or another of the Ten Commandments. Billboard space is donated in Birmingham by business concerns. Artistically painted upon the entire side of a big building, for instance, is, "Remember the Sabbath Day to keep it holy." And in small letters near the bottom, "This space donated to the cause of religion by the makers of—" some brand of flour or other commodity.

Yes, the South is American.

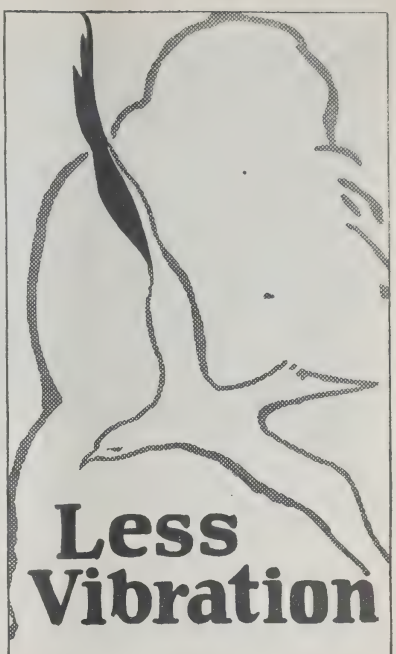
## Investigating the Air Investigations

(*Concluded from page 15*)

of the Chief of the Army Air Service and the Chief of the Navy Bureau of Aëronautics.

The organization of the Army and Navy that I have briefly sketched shows how deeply interested the officers who will conduct any future wars into which the country may be drawn are interested in the Air Service. It is the function of the Chief of Air Service and his assistants to train and instruct the personnel of an air force. As the testimony before all the boards shows, flying officers control the operations of the air force and the machines that are used. The other agencies in both the Army and Navy must consider it as it would affect the winning of a war. They must keep in mind the basic principle of the art of war which has been recognized by all of the great commanders that it is the Infantry, the nation in arms, that must deliver the decisive blow.

In this connection, a lecture by a distinguished officer is recalled. The subject that was assigned to him was the "Functions of the Infantry." He went at great length into the functions of the air service, artillery, cavalry, and the supply system. He dwelt at great length upon how they should be trained and organized until his hearers began to think that he had not understood what was his subject. Just as his time expired, he remarked, "Oh, yes, there is the infantry. When the infantry is defeated, the war is over. I thank you, gentlemen."



## Cricket in Samoa

WHEN a cricket match is to be played in Samoa, the entire population of both villages turn out for it. Wickets are set up in the widest spot to be found between the mountains and the sea, with some fielders ready to scramble uphill after balls and others at the edge of the surf ready to swim out after balls hit into the ocean. Both the hill-climbers and the seagoing players are kept right busy, too, when the game gets hot.

Men, women and children not playing in the game range themselves along the sides of the playing area, one village outfit on each side. These do the "rooting." When Britons play cricket the spectators keep fairly dignified. When applause is merited, it is dignified applause and does not distract the players. But a Samoan loves noise and 400 or 500 of them can make as much racket as a pop-eyed crowd of many thousands make at a crucial ball game in the big leagues of America.

The rooters on both sides begin a terrific din when the game starts and never stop while it progresses. With several hundred beating tin cans, yelling and shrieking and leaping about on the side lines, and with the players shouting to each other above the clamor of the spectators, the welkin is shattered beyond repair.

Games often last for several days and some have gone on for a week until the authorities have stopped them for fear the excitement would end in a battle royal between the partisans.

Less Vibration

Excessive vibration—the result of friction—means that the oil you are using has lost its lubricating properties.

Almost any fresh oil will hold up for a few miles—or until the motor really gets hot—but only a specially-refined oil—like Humble Motor Oil—can maintain the proper lubricating body under operating temperatures; keep down friction; hold an effective compression seal between piston rings and cylinder walls, and minimize crank-case dilution. Don't take chances with a poor oil.

The Humble Chart is your guide in buying the right oil.

HUMBLE OIL AND REFINING COMPANY
HOUSTON . TEXAS

Home of Indian trappers along the Minnesota-Canadian boundary.

# Trapping the Trappers

(*Continued from page 4*)

er I was sitting beside a red-hot stove. Three of the wardens were there. There was John Linklater, wiry Indian; Bill Hoffman, a giant in bronze and handsome as a statue; Bill Hanson, chief of the wardens. There was the supervisor of the National Forest, and some men who had come up from the Twin Cities.

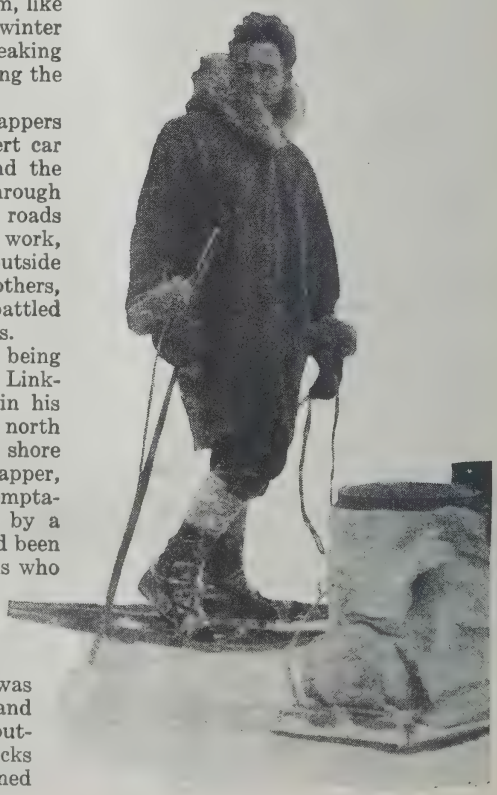
The party was leaving tomorrow for a trip of one hundred and fifty miles through the forest. Another party was leaving from the shore of Lake Superior, and all would meet at a certain lake.

Did I want to go? Of course. I made up a pack of a few belongings and the next morning, with the thermometer sinking low but a brilliant sun mounting into a blue sky, we set out: five teams of yelping dogs, and nearly a dozen men.

The first night we stopped at a deserted logging camp, and from Bill Hanson I learned about the beaver. There are countless thousands of beaver in this Superior Forest. They are protected by law. But the law has not always been observed. Until recently there were only two game wardens, and the outlaw trapping of beaver had flourished and men had grown rich from it. Two years ago the storm had broke. The trappers had divided into rival camps, and each camp decided to get rid of the other by exposing it to the state game and fish commissioner. When the smoke cleared neither faction was in power, and it was disclosed that during the previous winter nearly half a million dollars' worth of hides had been taken out of the forest: more than twenty thousand skins in all!

Wardens were drafted from other parts of the state; the best woodsmen in the Superior region were hired; and the war began in earnest. The outlaw trappers were not only crafty, they included the best woodsmen in the North. Wardens on snowshoes followed trails for days, sleeping in the snow at night when they must. Others slept out near beaver ponds in weather far below zero waiting to catch trappers at work.

But the trappers were experts, too. They knew how to cover up their tracks, knew how to hide their camps. Now and then a warden, braving more cold than a trapper cared to, outwatching a trapper at a beaver pond, made an arrest with frosted fingers and took his man to town; the two of them, like men who are together in the winter woods, camping out at night, breaking trail for each other by turns during the day.



The outlets used by the trappers were watched closely. But expert car drivers were on the outside, and the roar of tuned motors echoed through the forests along the sides of the roads leading south. It was thrilling work, this battle with the cars on the outside by one corps of wardens while others, who knew the country better, battled the trappers on their own grounds.

It was a strange war that was being waged inside the forest. John Linklater, the Indian, had brought in his own brother from the wilderness north of Grand Marais, far up on the shore of Lake Superior; and a state trapper, who could not withstand the temptation of the fortune represented by a small pile of flat beaver skins, had been brought in by one of the wardens who had lain all night in thirty below zero by the side of a frozen beaver dam. Leo Chosa, quarter-breed Indian, expert woodsman and chief of the outlaws, was made head warden last year, and struck terror to the hearts of the outlaws, for he knew all of their tricks and hiding places. But Leo resigned last spring and disappeared into the woods with a dog team and a complete outfit. When he appeared in town next, he had a roll of bills large enough, as the saying goes, to choke a horse. He had been trapping, he said, in Canada.

The game and fish department decided to stop illegal trapping. Their dog teams and corps of wardens, with the assistance of the forest rangers, gradually gained the upper hand. But there had been threats on the part of the outlaws—for this is an outspoken country and an outlaw going into the depths of the forest is quite likely to do it with a brave flourish—that a big clean-up of beaver was due in the spring. Thus they would have to start work, hauling in supplies and locating their camps, early in March. And it was then that I had arrived at Winton and was on my way with the cavalcade through the interior of the forest.

The snow was soft on the second day, and the portages long. We were tired when we got to a forest ranger's cabin for the night, and the dog drivers were steaming with perspiration and shedding their fur-trimmed parkas.

It was at the end of the next day, as we were winding our way over a long portage trail through the woods, that we heard a droning overhead and saw a plane approaching. It dipped low over us, rose again, then spiralled and slid out of sight behind the trees. Two hours later, when we arrived at another old logging camp where we were to spend the night, we found the plane there, resting on the snow-covered lake near the shore.

The aviator talked with us for an hour, drank a cup of hot coffee, then got in his plane, rose out of the wilderness with a roar, and went back toward the town. I asked Bill Hoffman who he was, what he was doing.

"It's hard to say," replied Hoffman; "he has three planes on a lake near town. He flies away toward Canada. Sometimes all the planes are gone. It's a strange thing for this country, to see planes flying over the forest."

"Once last summer I found two barrels of gasoline and one of oil beside a little hidden lake in the middle of the forest near the Canadian boundary," observed Bill Hanson; and we let it go at that.

The wind blew hard from the northeast when we started out next morning and a haze hung over the eastern horizon, so that the sun was a red ball until near noon. In the afternoon the snow came, and the wind grew warm and turned it to sleet.

It was nearly dark when we reached the lea shore and set up camp near a trapper's cabin. The storm cleared after dark, and we made a huge bonfire and dried out our icy clothing.

But in the morning the blizzard resumed its march. Again we bored into it all day. We rested for a few minutes at the edge of the lake, then set out. The storm now was terrific. Once out on the lake, every sign of land was lost in the flying snow. Occasionally we could catch glimpses of a dog team or two, but generally we could see only a few yards ahead. While plodding along in the middle of the lake, I almost bumped into a group of men and a dog team. The men were watching a dog that was lying in the snow.

I joined them, and learned the dog had been poisoned. He lay stiff, his extended legs jerking spasmodically in short, nervous twitches. His eyes were glazing. He had eaten poison during the rest at the end of the last portage.

We camped early that night, and when we resumed our journey the next morning the storm had gone and the sun rose into a clear sky. We were now entering the beaver country. We had reached the interior of the Superior Forest. For three days we pushed on through a scenic wonderland, over trails denied to the summer traveler.

We passed many dams of the beaver, and we saw places where, their stored food having given out, they had come out on the snow and cut down trees, hauling the tender shoots and smaller branches through holes in the ice. We saw the tracks of moose and of wolves.

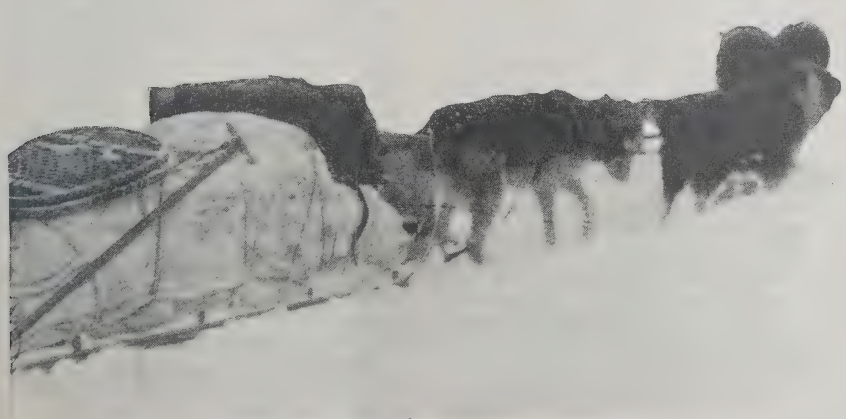
We saw two beaver dams that had been blown up with dynamite. The wardens held mysterious conferences.

Then toward noon of one day we turned a point near the end of a lake and saw a cabin. Smoke came from the chimney. A chorus of howls rose in the air and we could see huskies chained to trees around the cabin. Men came out, and welcomed us. One of them was the game and fish commissioner. With three dog teams, he had come north from the shore of Lake Superior. This was the meeting place.

The wardens from the south told of certain men who had come into the woods. That afternoon two wardens left our cabin and headed east, traveling fast and light.

We had planned on remaining at the cabin all night, but it was decided to continue. Again the yelping dogs strained forward in their traces, and the creak of snowshoes kept time. Two wardens from the south stayed at the cabin with one dog team. They had special work to do. The supervisor of the National Forest and I decided to stay with them.

"The party from the shore of Lake Superior was waiting for us at the cabin."



Later in the day we went out on the lake, cut a hole in it, and fished. It was cold work. We built a fire in the lea of a nearby drift and I'm afraid we didn't take good care of our lines. At any rate when we took them up we had to chop them out of the new ice.

In the morning the supervisor and I set out to catch the main party. All morning we traveled fast, and when at noon we came to a cabin in a clearing and there met our companions, we had covered eighteen miles of trail. We had seen several damaged beaver dams, and strange trails in the snow.

The cabin, the first habitation we had seen for more than a hundred miles, belonged to a man by the name of Charles Lewis. He lived there with his wife and little girl. Twice a week he snowshoed to the post office, thirty miles away on the shore of Lake Superior, after the mail. The post office also marked the location of their nearest neighbor. Lewis was a fine American of Maine type, and his wife was a splendid example of pioneer wife and mother. At the spinning wheel she made wool yarn, and from the yarn she made their clothing.

The little girl's only toy was a wooden cow, made by her father.

The family had lived there several years; had made a house and a small farm out of the wilderness. Lewis was an expert trapper, and was experimenting with the domestication of the fisher, a small animal but a valuable one for its rare fur. The trapper was a man of much more than ordinary education, and his wife was obviously a woman who had lived in more urban surroundings. It was amazing to see what these people had

Supervisor of wardens, "Bill" Hanson, with his team.

wrested from the wilderness. They lived in comfort, had everything they needed, in marked contrast to the scanty equipment of the more shiftless settler. All of it they made with their own hands from material at hand.

We enjoyed a fine meal with the Lewis family, then continued along the trail for a few hours more and camped in a large log cabin used during the summer as a vacation home by a Chicago man. We were nearing the shore of Lake Superior.

It was close to noon of the following day that we topped a great range of hills and looked at the ice-filled lake far below us. For two hours we walked downhill, then reached the shore of Superior. We were on the road that led to Duluth, some sixty or seventy miles away.

The party was now stripped bare of all supercargoes. We were patted on the back and herded into Charlie Nelson's hotel on the shore of the lake, and a telephone call to Duluth started transportation out to get us.

The wardens, rid of their encumbrances, turned back into the forest.

The grand offensive by the outlaw trappers fizzled out. A few had gone into the forest, but their reports on the manner in which the state was preparing to meet them discouraged the rest. The beaver war is about over. Now and then a trapper will disappear from the settlements and whirl into the woods, make a quick killing and come out again. It is hard to clamp the lid down on such a big country. But the systematic running of beaver hides is probably over. The best men are now on the side of the state. They fear nothing. They will take the hardest trails at a moment's notice. They have the best dogs in the North. And, like the famed Sergeants of the Mounted that flit through all of the Canadian Northwest and most of the American movies, they *Always Get Their Man.*

Within twenty-four hours I was dodging Chicago's traffic. Visions of blizzard-swept lakes, galloping dog teams, fur parkas and snowshoes, dense forests and unknown lakes, seemed far away indeed.

But it was within a few hours' travel of a city of four million persons that I had found the real Near North, no less romantic, no less gripping in its rugged geography and its touch of human drama, because it was not closer to the Arctic Circle.

## Fewer Free Passes

The extra time that can be spent at home in the morning and evening through the use of their own motor cars in going to and from work has led power house and equipment workers of the Omaha & Council Bluffs Street Railway Company to decrease their use of free passes to such an extent that the street railway commission made an investigation. The above condition was then discovered.

***The Man from Germany*** came into The Office quite belligerent in a way because, to his mind, only ignorance could permit an opinion that Germany had anything of herself to do to justify her place in the world: he seemed to think that Germany was all right, but the rest of the world was so wrong that Germany suffered by her inevitable contact with it. It was evident that the war was an embarrassing interval in this man's thinking, but important only as people remembered it; he said he was traveling to discover how far people had forgotten the war. He said that he found in America a decided inclination to let bygones be bygones, but at the same time he felt that his country was not being welcomed back with complete confidence. This he apparently regarded as a grievance. Yet he admitted that he did not see how it could well be otherwise, and indeed he was highly sensible of the fact that it might be infinitely worse. So he said he would continue his search for the American Opinion. He had a long list of people to see, many of whom were the last ones to inquire concerning *American* opinion. But it is, I suppose, all a part of that German "thoroughness" of which we used to hear so much.

***The Man from England*** dropped into the office and remarked that he was inclined to doubt the Pollyanna theory that the better acquainted the nations become, the more they like each other. In a long experience, he says, he has observed that the result was just opposite. At present, says he, the more the other nations see and hear about the United States, the more they hate us. England, he asserts, is no exception. The feeling against us which is being sedulously propagated in the British Isles is not only unpleasant in the extreme but, he feels, dangerous. Their feeling toward Germany is ardent love compared with their feeling toward America. Go down Regent street and you will see store windows filled with German goods, displaying German trade-marks, et cetera, to all passers-by. But if a merchant has a stock of American goods, he carefully removes every evidence of their place of origin—they would not sell, otherwise. Even the little brass tags indicating the American origin of certain modern machinery are invariably removed. A British traffic expert visited America this autumn, saw how we marked traffic bounds with broad bands of white paint on the pavement, went home and introduced it. As an American idea? No, that would have queered it. It was purely a British invention and discovery. The reason for this state of mind is obvious. Britain is slipping off her high places. Telling herself that she is the greatest nation in the world has no effect in improving her fortunes. She hates to bow to a nation which has only the Aristocracy of Work to boast of. She cannot forgive America for possessing more energy and brains than Britain does. So she just cordially dislikes us and says so with superior bluntness. For heaven's sake, said our visitor, don't be taken in by this "hands across the sea" stuff. You will never hear it again until England gets into such deep trouble that we shall have to pull her out once more.

***The Woman from the West*** came into The Office, hot on the trail of the militarists and the medical profession. We found it impossible to agree with any of her views, but equally impossible not to sympathize with her state of mind. It was not a case of need, but none the less one of trouble. I think none of us begins to realize the amount of trouble in the world, and it is better that we do not. This woman was a widow who had poured her whole life into her son. The war came on, but, as she expressed it, "he was not healthy enough to kill," and was rejected from military service. He enlisted in some other capacity. Determined, you see. Just like his mother. He was a fighter, so is she. But she blames the militarists that there was a war at all. Then her son became ill—this was after the war—and the mother thinks the doctors did not treat him properly. She now blames the whole medical profession. She has come to think that they have an economic interest in promoting disease. She has come to think that every sanitary advance in the world has been made against the bitter opposition of the medical profession. And she labors these points with shrewd intelligence. Utterly useless to point out to her the martyrs of medicine, even in our day, who have died to discover the cause and cure of disease. Utterly useless to cite instance after instance, even recent ones, where doctors have had to fight whole municipal political combines to get so simple a thing as sanitary sewage and alley-cleaning. All she would answer was that I was "pro-medical." I was on the other side. So she goes through the world with that monstrous belief in her heart that "the medicals" have an interest in continuing the ravages of disease among humanity.

# Should America Join World Court?

(*Concluded from page 5*)

leader *for* the Court. Administration support is mostly passive. At this distance it looks as if there is nobody to make a real fight, such, for example, as Senator Hitchcock made for President Wilson in the League of Nations battle.

The Democrats have announced that they will give practically their solid party vote to the Administration program. With the exception of Reed and possibly Blease, of South Carolina, the block of forty Democratic Senators will vote for adherence with the Harding-Hughes reservations, or anything similar to them.

This gives the Administration a big lever with which to start. It only needs to line up half the Republican membership in addition to the Democrats to produce a two-thirds vote. On the surface this looks as if it should be easy but the opposition also has an advantage. To win, it only needs to line up one more than one-third of the Senate—thirty-four votes. The administration must get sixty-six.

Those who favor American adherence to the World Court make the following arguments in support of their position:

1. That the Court offers a beginning in judicial settlement of international disputes—a traditional American policy.

2. That the World War demonstrated the necessity of such a Court and that the union of most of the nations after the war made it possible to establish it.

3. That the World Court is now established and functioning with the support of nearly all the civilized nations of the world.

4. That eminent judges administer the principles of international law and custom within a safe jurisdiction, limited to cases which both parties to a dispute agree to bring before it and to cases arising under treaties between the parties.

5. That the World Court is not a League Court but a Court of the forty-eight nations that have entered it.

6. That the Harding-Hughes reservations adequately safeguard American interests.

Those who oppose American adherence make the following arguments in support of their position:

1. That adherence to the World Court would put the United States at the mercy of European nations with ideals and interests vastly different from America's.

2. That the World Court is a League Court.

(a) It was created by the League.

(b) Its judges are elected by the Council and Assembly of the League, even though chosen from nominees submitted by the nations represented at The Hague.

(c) Its salaries and expenses are paid by the League.

(d) It acts as legal advisor to the League, giving advisory opinions when requested to do so.

3. That America is bound always to be in a slender minority, in representation among the nine judges and four deputy judges, because of the large number of votes of other nations participating in the election of judges.

(a) Australia, Canada, New South Wales, South Africa and the Irish Free State have one vote each in the Assembly of the League, thus giving the British Empire five votes in that body.

4. That the jurisdiction of the World Court is not sufficiently defined and safeguarded and therefore adherence would mean America's entry with her eyes shut.

5. That the provision of the World Court statute giving the Court jurisdiction *only* in cases where *both* parties to a dispute agree to take it to the Court makes it possible for any nation to deny the jurisdiction of the Court in any given controversy. While the United States would "play the game" in good faith and stand ready to submit any dispute to the Court, foreign nations, accustomed to intrigue, would remain free to submit or decline to submit as suited their pleasure.

Proponents of American adherence make a virtue of objection No. 5, President Coolidge expressing it in these words:

> "The Court is merely a convenient instrument of adjustment to which we could go but to which we could not be brought."

The Administration supporters also contend that any possibility of harm to America from European nations operating through the League is eliminated by the Harding-Hughes reservations, four in number, as follows:

1. That such adhesion shall not be taken to involve any legal relation on the part of the United States to the League of Nations or the assumption of any obligation by the United States under the Covenant of the League of Nations consisting of Part 1 of the Treaty of Versailles.

2. That the United States shall be permitted to participate through representatives designated for the purpose and upon an equality with the other states members respectively of the Council and Assembly of the League of Nations in any and all proceedings of either the Council or the Assembly for the election of judges or deputy judges of the Permanent Court of International Justice, or for the filling of vacancies.

3. That the United States shall pay a fair share of the expenses of the Court as determined and appropriated from time to time by the Congress of the United States.

4. That the Statute for the Permanent Court of International Justice adjoined to the protocol shall not be amended without the consent of the United States.

(A fifth reservation has been agreed upon by the Administration and its supporters and will be added to the above. It is as follows:)

5. That the United States shall not be bound by any advisory opinion of the Permanent Court of International Justice unless it has joined in asking for it.

Many Republican Senators feel that the above reservations do not go far enough to guarantee protection of American interests. They favor the amendment of the World Court statute and would withhold American adherence until all forty-eight nations accepted such amendments. They believe that only by such action can the United States be protected. "Reservations," they fear, would mean nothing to the other nations.

The Administration and its friends, on the other hand, argue that it is unreasonable for the United States to expect the other forty-eight nations, already operating successfully under the existing statute, to amend it at the insistence of the United States, which has been laggard in entering the Court. They oppose any Senatorial action which would call for amendment of the statute and hold that such procedure would be equivalent to refusal to adhere to the Court, for the reason that the other nations would not consent to amendment. It is argued that the Harding-Hughes reservations are adequate and that they can be validated by an exchange of notes between the United States and the forty-eight nations now in the Court.

It will start on December 17 and is likely to last all winter. Unlimited debate is still the order of the day in the upper house and this subject is one upon which members will seek to enlighten colleagues and constituents.

# Men and Equipment

Two vital factors in making Ford values what they are today, are the intelligent direction of man-power in Ford plants, and the use of the right equipment.

It is a Ford principle to encourage the individual to do his own thinking and to share with the Company the responsibility for the quality of the products and the maintenance of low prices.

By improving working conditions, by providing better machines and keeping them adequately cared for, and by making no task so arduous that it must be performed hastily or under strain, the highest standard of individual workmanship is sustained.

Only through the carrying out of this principle is the present scale of Ford output possible—and thereby the greater value that Ford offers you in motor cars.

FORD MOTOR COMPANY, DETROIT, MICH.

Ford

## Governors Plead for Their States

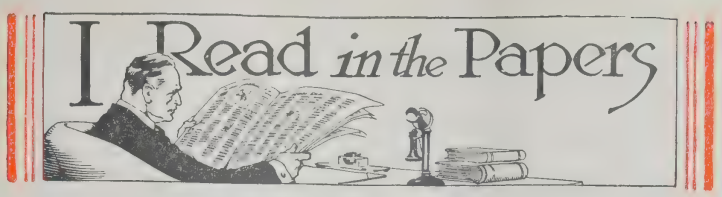
(*Concluded from page 3*)

tural resources, living standards and average personal income, they are probably in a better condition than the others. For example, the state where the biggest percentage of the population makes Federal income tax returns has the smallest number of persons. The incomes reported from the different states do not show very wide margins.

The difference is that in the "big" states a greater number of large single fortunes are found than in the average of the "little" ones. This is because of the tendency of fluid wealth, as represented by money or securities, to concentrate more at certain points than at others in the country.

This fluid wealth is the kind which can be reached most easily by taxes. The only way virtually by which the "poor" states can tax that in the "rich" ones is by using the Federal Government as an intermediary. And the only way they ordinarily can use the Federal Government as an intermediary is by surrendering some of their prerogatives and by compelling other states to do likewise.

These prerogatives enter into the life and being of States' Rights, or, more properly still, local self-government, for which the term States' Rights has been in much part a misnomer.



"Something should be done," someone declares.

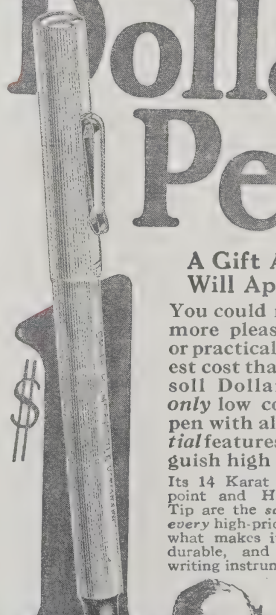
"All right, let the Federal Government do it," the small or "poor" states are inclined to say, "as then it will cost us less than if we do it ourselves." This is because a few "big" states pay above the average Federal taxes and a majority pay less than the average.

And when such is the case they are not so censorious of the merit of the proposal as they would be if the cost fell equally on all.

Thus much that belongs truly to local government passes into the hands of Washington bureaus, and some of it is of a kind that folk, knowing that they must meet its cost, wouldn't permit local government to undertake.

But the process has gone beyond that. It now includes the distribution of funds among the states in the form of "fifty-fifty" appropriations. That is, the states must put up equal amounts for the purposes comprehended—these purposes being strictly defined by Congress, which provides for the maintenance of Federal supervision over the spending of what comes from state as well as Federal coffers. This calls for the conceding of rights from the states to the Federal Government and might call for, and make legal, concessions that go beyond the Federal Constitution.

***I read in the papers*** that no Nobel prizes will be awarded this year because of "the lack of qualified candidates" and the "need of funds for the Nobel Library and the Physical and Chemical Institute, both founded by Alfred Nobel as part of his memorial."

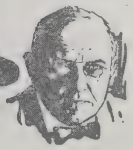


There seem to be lean intellectual years as well as lean wheat crops or corn yields. This is the first time since the Nobel prizes were given, twenty-four years ago, that all five of the prizes have been withheld. At least two of them, physics and medicine, are not only alive but continually expanding and developing something new. In chemistry, literature and physiology, probably not so much: certainly not in literature.

***I read in the papers*** that the iron ore deposits of Newfoundland constitute fifteen per cent of the world's known commercial iron ore. These deposits are being mined and ferried across a narrow strait to Sydney, Nova Scotia, where the only eastern Canadian coal deposits are located and blast furnaces and steel mills operated. Incidentally the Newfoundland government, regardless of the employment that the working of the ore deposits gives to citizens of the island, has imposed an export tax upon iron ore shipped to Nova Scotia although no such tax is levied upon ore mined and shipped to the rest of the world. The common sense of the founders of the American republic is emphasized by the fact that our Constitution expressly forbids the imposition of an export tax that merely would serve to limit the production and exploitation of natural resources.

*The International Jew* in 4 volumes: *The International Jew*, Vol. I, 235 pages; *Jewish Activities in the United States*, Vol. II, 256 pages; *Jewish Influence on American Life*, Vol. III, 256 pages; *Aspects of Jewish Power in the United States*, Vol. IV, 246 pages. Price: 25 cents each; set, $1. The Dearborn Publishing Company, Dearborn, Michigan.

***I read in the papers*** that the largest apple orchard in the world, consisting of more than twelve thousand acres of trees and located near Hillview, Illinois, has yielded but fifty-one thousand barrels in its best yield of 30 years, and the owners were dissatisfied. The Illinois State Agricultural College, upon consultation, advised that beehives be set out in the orchard to further cross fertilization of the apple trees through the honey-seeking activities of the bees. As a result of setting one hundred hives out, the yield was increased to 65,000 barrels of first quality apples, 250 carloads of second choice or bulk apples for immediate sale, and it is estimated that ten thousand barrels were lost through an exceptionally early and severe frost. To clinch the argument on behalf of the bees, the neighbors in that section harvested fewer apples than in average years. An orchardist who had an orchard near another man's apiary obtained more apples from that orchard than his other one. Insects are absolutely necessary for the cross-pollinization of melons, cucumbers and some varieties of strawberries, and bees are the only insects that man can control.



Chas. H. Ingersoll
EVERLASTING
Dollar Pen

A Gift Anyone Will Appreciate

You could not choose a more pleasing, lasting or practical gift of modest cost than the Ingersoll Dollar Pen—the *only* low cost fountain pen with all the *essential* features that distinguish high priced pens.

Its 14 Karat GOLD writing point and Hard IRIDIUM Tip are the *same* as used in *every* high-priced pen. That's what makes it so amazingly durable, and so smooth a writing instrument!

Three models to choose from—Men's, Women's, Juniors'.

*Designed, manufactured and GUARANTEED by Chas. H. Ingersoll of Dollar Watch fame.*

AT 15,000 DEALERS: If your dealer cannot supply you, we will fill your order direct, charges prepaid. Remit ONE DOLLAR for each pen ordered and specify models desired.

NOTICE TO DEALERS: Here is a low cost fountain pen you can SAFELY sell and recommend for value and quality. Order a dozen at trade price, GUARANTEED to meet approval, or write for liberal proposition.

CHAS. H. INGERSOLL DOLLAR PEN CO.
1112 Astor Street - Newark, New Jersey.

# Seen in an Egyptian Village

## Some Close-Ups of a People Who Are Just as Primitive as When Moses Lived

Peasant in field. The man has twisted a cloth about him to be photographed. They usully work entirely nude.

By WILLIAM H. WORRELL,

Ex-director of the American School of Oriental Research in Jerusalem, lecturer in Columbia University, professor in the Hartford Seminary Foundation.

IT IS quite easy to inform oneself about the geography, or history, or literature of a foreign country, but very difficult to learn anything about the real daily life of a foreign people. Books continue to be made from other books. Travelers often do not actually live among the plain folk; and, when they do, they see mostly what they have been taught to see. When they write they forget that they are describing *people*, not outlandish beings. Now, because it was my good fortune to spend a considerable time in Hawatka and other Upper Egyptian villages and in the slums of Cairo, I am going to try to tell just what I saw there from day to day. Not all that I shall say will be pleasant exactly, but you may be assured that every word of it is true.

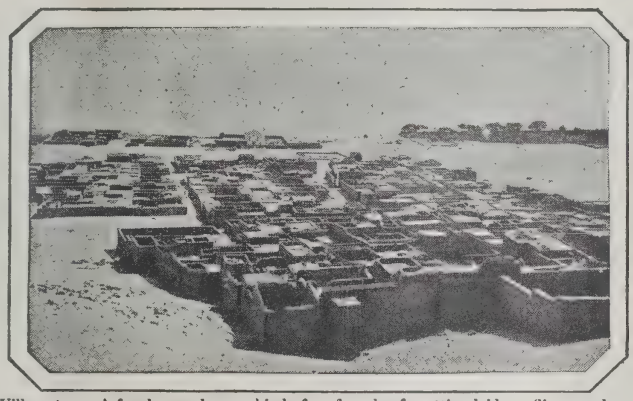
The Egyptian peasant, or "fallah," although he speaks the Arabic language and professes in most cases the religion of the Arabian prophet, Mohammed, is a pure-blooded lineal descendant of the peasant who tilled the fields in the days of the Pharaohs. Christianity and Mohammedanism have not changed him much; so that, while we are learning about his ways today, we are at the same time learning about his ways in the time of Moses.

The thing that strikes one first in Egypt—after one has got used to the impressive monuments—is the *dirt*. The peasants live in little mud-and-reed-built houses, without roofs and without windows (for it never rains in Upper Egypt), without drains or latrines, without any water supply. No wonder that they spend very little time there, and live mostly in the open. Water is carried from a nearby inlet of the Nile. Slops are thrown off the housetops into the narrow, twisting lanes and into the courtyards below, as is also the garbage and animal refuse. The sun that shines every day in the year speedily dries up the water and such of the garbage and offal as is not immediately devoured by the multitude of hungry, mangy, yapping dogs, and the prowling bob-tailed cats, and the scuttling rats. You remember that cats were first bred in Egypt to eat the rats that ate the grain that lay in the storehouses that Pharaoh built. The dogs and cats were so useful that they finally became gods. In these dusty, dirty, draughty huts, then, elaborate and mostly fried food is prepared, over sickly fires of stubble or charcoal, in the presence of all the domestic animals and fowls, and under the superintendence of innumerable busy crawling things. The woman wears a trailing garment and veil which she uses indiscriminately for wiping her brow, the baby's nose, and the cooking utensils. Bread-cakes, and refuse-cakes for fuel, are baked side by side in the blistering sun. On the earthen floor are the bones and other solid remains of past meals. Inquiry as to the more intimate conveniences brings the reply: "O, my lord! Have we not all the open country, as far as eye can reach?" A mercy that they have the burning, disinfecting sun, and the dry desert air, though piercing cold at night; a mercy that there is no timber in Egypt with which to build roofs.

Blood of the Pharaohs. This peasant lad shows how pure the old blood of the Pharaohs has maintained itself.

The fallah is one of the laziest of created beings, and one of the hardest worked. His idea of bliss is to sit and smoke, or drink coffee, and gossip, or tell stories. He has to work very hard, not only plowing, sowing, harvesting, and marketing, but irrigating his land with the bucket and well-sweep, called "shadduf." He is very prosperous now, under the wise administration of Great Britain; but for nearly five thousand years he had been taxed to the point of extinction. He is 95 per cent illiterate. He cannot even understand the newspaper when it is read aloud to him, so divergent has his speech become from the written language. He delights in tales of deceit, and marvels, and fabulous wealth and ease. He will attend any number of religious services, of any length and character, for the sake of herding pleasantly with his kind, hearing speeches, and singing. He has no idea of the flight of time nor of its value. He will promise to meet you tomorrow at a certain time "if it please Allah." If you insist that he shall be there he will call it an appointment "inglizi," or after the manner of an Englishman, that is, on time. The native-operated steamboat on the Ibrahimiyyah Canal leaves "at sunrise, if it please God." You have to go early and sit around for an hour if you don't wish to risk missing it. When time for prayer comes the engineer-fireman shuts off the steam and prays toward Mecca.

The fallah is not veracious. He doesn't even try to be. He looks upon lying as one of the little social graces, and as one of God's gifts to the relief of life's tedium and imperfection. Why tell a disagreeable truth when one can substitute a beautiful fancification of reality? So inbred is this habit of speaking beautifully of things, and so unusual is the instance of frank utterance, that the mere mention of evil is regarded with repugnance: If you should speak of death you would be prompted to add the formula, "Far be it from the listeners!" If you are not thus tactful, your companions will mutter it under their breath. If you persist in this habit you will be an ill-omened person, to be avoided. Poor,



Peasant Moslem women in villages do not worry about veils. Only two of the eleven persons have normal eyes.

shivering beggars regale themselves with pleasant exaggeration of good that was or still may be. In short, language creates an artificial world; and language, being cheaper than opium or hashish, is the Egyptian's chief addiction. When the father of the family retires, at about forty, if he can, he is said to be "sitting in the house," which means that he is spinning wool for the family loom, and pleasant talk for all who will listen.

Centuries of poverty have bred the habit where it is not now the fact. A pair of shoes is a luxury. If you, the guest, have three or four, you will be expected to divide up with your host. There is little furniture, and that is cheap, tawdry, and in bad repair. Strange that the builders of the Pyramids and the Temple of Karnak cannot now paint a window sash without leaving a lot of paint on the glass. There is much cheap jewelry. There is great display of food when there are guests. At other times a man will go all day with nothing but water and a handful of dried dates, occasional minute cups of strong coffee, and incessant cigarets.

Hospitality is the Egyptian peasant's chief virtue—incredible generosity in the entertainment of total strangers, whom he would not hesitate to deceive, or cheat, or rob outright under other circumstances. Hospitality, of course, is always found among people who live in a certain stage of social development. There are no inns in Egypt, except in the large cities. One gives entertainment because one expects to receive it without question. It is not unjust to add that hospitality is enforced by implacable public opinion. If a man refused a guest, or received one for payment, he would make a public scandal. Did not one of the poets say of such people: "Their men can never say yes, and their women can never say no!" Hospitality is the chief subject of boasting, and the chief criterion of "nobility."

The lot of womankind in Egypt is not an easy one. She has a bad reputation in literature and in the mouth of men, and she has learned to live up to this. Even among Christians one never converses alone with a woman, or presumes to speak of her, or of knowing her. Among Moslems one has to pretend that there are no women, in the concrete, and related to the men with whom one associates. In cities like Cairo the whole house, except the reception room near the door, is "harem," or "forbidden." Women have no inner defenses, and are not expected to have any. Married life is for the man an agony of jealousy and suspicion, and for the woman a career of fear and evasion. Contact with the West has brought a certain amount of light to bear upon the causes of this situation and their remedy. There is a proverb now that runs: "Thief fears for house, paramour for spouse."

Village top. A few houses have a kind of roof made of matting laid on flimsy poles

Marriage among the Egyptian "Coptic" Christians is monogamous and permanent; and there still lingers the tradition of the greater blessedness of celibacy. But among the Moslems it is the precise opposite: marriage is the ideal state on earth and in heaven; a man may have three wives besides his concubines, and he may divorce any of the wives by merely putting them out of the house, and, here is the difficulty, restoring the dowry which he originally received from the wife's father. That is the theory. In practice divorce is rather difficult. The husband has usually invested or spent the dowry, or the wife has spent it in his name; and he has difficulty in saving so large a sum. Then there are the male relatives of the wife whose fists have to be reckoned with. They are the same the world over, law or no law. Polygamy also has its difficulties. The Prophet observed that a man was entitled to several wives only when he was sure of being just to them all—a thing which every Egyptian will admit is possible only to the Prophet himself—peace be upon him! Human nature is the same in Egypt as elsewhere, if not more so. No man can live with several wives in peace in one household. Few men can maintain several homes; and who wants more than one home anyway? No woman wants a lot of other wives hanging around, with different and decided opinions, foolish ones, about nearly everything. So most Moslem Egyptians are content with monogamy, relieved now and then by divorce and remarriage. Many Moslems pass their whole lives with one wife, sixty years in one case I knew of, and we may be sure that they were happy. A woman cannot divorce a man for any reason whatsoever, which I believe was the case also in England until very recent times, by the way.

If my readers could ask questions, I know they would say: "How about sheiks?" Alas for the Egyptian sheik, or "sheich," as he calls himself! The sheich is nothing but the chief man of the village, or the community, or the household. The word means originally "old man," and such he often is. The kind of person of whom my readers are thinking does however exist. The Arab lover, in the words of the poet, does almost "die when he loves." His love-poetry and song are most burning and extravagant. He cannot keep his business to himself.

Peasant family. My host, the sheik, with his family of four generations, seated with exact reference to age and rank.

It is a healthy sign when a nation is sufficiently interested in art that the people are ready to fly to arms over the subject. It implies that Americans can become enthusiastic over something besides stocks and bonds. Time was, not so long ago, when there was no American art. Now every village common boasts of the supposed likeness of an alleged hero.

# Is There Iconoclasm in America?

By CARSON C. HATHAWAY

THE average American regards any Greek statue as "art" but he receives the work of his own countrymen with distinct reservations. As he has never seen Messrs. Zeus or Apollo, he accepts them on faith but on the subject of twentieth-century statesmen, no sculptor can deceive him.

One of the first statues in this land was unveiled in New York City in 1770. It was an equestrian model of King George III. Shortly afterward, American patriots melted his royal highness into bullets. This fate was prophetic of the treatment to be accorded to many another work of art.

The second New York statue was that of William Pitt, dedicated in 1770. When British soldiers occupied the city, they cut off Pitt's head and arms, in which condition he remains to this day.

Thus was sculpture welcomed to the New World. For a time the pioneers were busy clearing forests and exterminating Indians—occupations not conducive to creative art.

One of the most noteworthy of the early sculptors was Horatio Greenough, born in 1805. He attended Harvard, later journeying to Rome to study art. His success with a group of cherubs designed for James Fenimore Cooper attracted Congressional attention and he was given a commission for a statue of George Washington.

Opposite the White House, stands Clarke Mills' famous statue of Andrew Jackson, which has created a furor of discussion. He boasted that, "It is the first equestrian statue in the world ever self-poised on the hind feet." For more than seventy years the Presidents of the United States have viewed *Jackson* from the White House door.

Protests aiming at its removal have been unavailing. It was argued that it was inappropriate to have a statue of Jackson in a park dedicated to Revolutionary heroes.

"Why not solve the problem," critics said, "by adding Washington and subtracting Jackson?"

At the mere suggestion, fiery indignation meetings were held in Tennessee. Andrew still waves his hat from on high.

All sculptors seem to insist on including Lincoln in their repertoire. Three years after his assassination, a statue of him by Lot Flannery was unveiled. Placed on a towering column, the statue was dwarfed. Flannery explained, "I lived in gloom following the assassination and I resolved to place it so high that no assassin's hand could ever again strike him down."

Although the statue was frequently criticized, it remained until 1919, when it was stored away. Some of the old inhabitants who had contributed funds toward its erection were still living in Washington and their views were more forceful than artistic. Congress itself directed that Flannery's *Lincoln* should be restored.

George Gray Barnard stirred up an international controversy with his Lincoln statue to be erected in Cincinnati. But when it was suggested that the work be presented to England a verbal battle was on.

"Respect seems to require that the statues should not be freaks of fancy which might, with few alterations, serve as figures of Ichabod Crane."

"Mr. Barnard has given us his vision of Lincoln, personal, human, absolutely sincere." And so on.

A compromise was effected. To London, a copy of Saint-Gaudens' *Lincoln* was dispatched, while Barnard's was unveiled in Manchester.

Frederick MacMonnies was assailed for his striking group entitled *Civic Virtue*, in New York City. The women discovered that it represented a youth standing over two prostrate maidens. It was announced that it had been carved from the largest single block of marble used by a sculptor since the days of Michel Angelo's *David*. Just as the *David* was set upon and stoned by angry mobs when it was being hauled through the streets of Rome, so *Civic Virtue* was assailed by a volley of verbal missiles.

"The same thing happened years ago when my *Bacchante* was refused by Boston," said MacMonnies. The woman had a bunch of grapes in her hand and they said it was the figure of a drunken woman.

Eventually, after public hearings had been conducted to determine the propriety of the group, it was formally accepted by the city of New York. Virtue still stands supreme.

In Washington, a monument designed by Adelaide Johnson had been presented to the National Capitol. It consisted of a huge marble block surmounted by busts of three famous suffrage leaders, Susan B. Anthony, Elizabeth Cady Stanton and Lucretia Mott.

After the monument had rested in Statuary Hall, in the Capitol, it was quietly announced that the block was so heavy that its presence would endanger the safety of the building. It was, therefore, consigned to the dim corridors of the basement where it is still visited by admiring delegations of suffrag-ists and -ettes.

To honor the memory of a prominent Washingtonian, a statue was installed representing a nude maiden petting a fawn.

Said the natives, between gasps, "The Judge would never have approved. He was a good Baptist. He will turn over in his grave about it."

One of the most unusual of modern controversies over a work of art has arisen over the merits of the idea expressed by the proposed Navy-Marine Memorial to be erected in Washington in memory of Americans lost at sea. The monument represents a huge wave of the sea over which seven sea gulls are poised. The birds are connected by an ingenious system of wiring so that they seem to be hovering over the waves.

"Sea gulls!" some critics have exclaimed. "How inappropriate. They are the scavengers of the waters. They are neither majestic nor beautiful."

"So are all birds scavengers," an answer has come, "including the famous American eagle, which we are proud to call our national bird."

So the controversies rage on. The generals on fiery steeds who adorn our public parks were not more daring than the dauntless sculptors who fly in the face of public opinion. No doubt the artists would do well to follow the example of the ancients and concentrate on gods and goddesses. American sculptors, however, with characteristic boldness, seldom behold a fat old politician waddling down Main street without being seized with an impulse to perpetuate his memory.

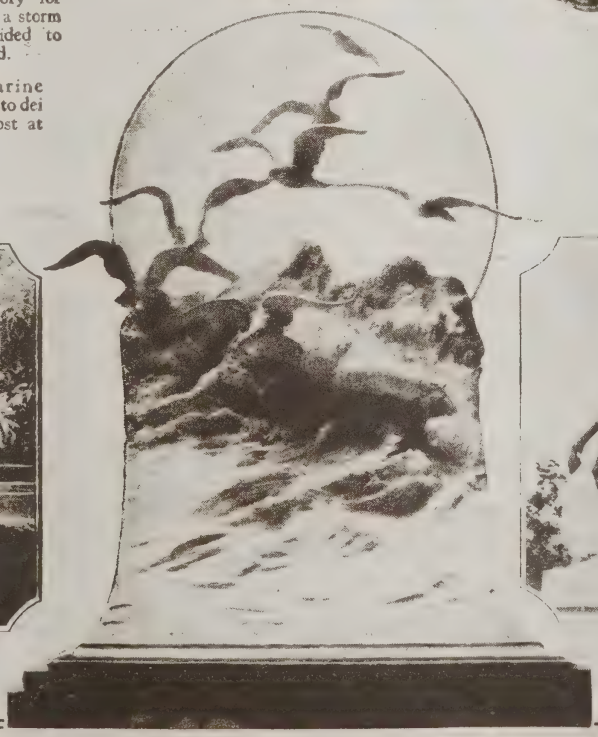
Perhaps some day, if our civilization falls, there may be buried a Venus de Chicago or an Apollo à la Kalamazoo that will persuade some distant peoples that we accomplished something really worth while.

# Iconoclasm in America

In illustration of the article facing this page

BARNARD'S representation of Lincoln, which was satisfactory for Cincinnati, but which became a storm center before it could be decided to present a copy to England.

LOWER center—Marine memorial created by Ernesto dei Pratta honoring Americans lost at sea.



THE statue above was winner in a competition for a memorial to Judge Joseph Darlington, of Washington. His friends opposed it, but sculptor Jannewein said, "Better to represent the maiden as she came from her Creator than her dressmaker."

LEFT—George Washington by Horace Greenough, whose training in Rome inspired him to garb the President in the fashion of the old Roman gods. America greeted the statue enthusiastically, in the belief that it represented the Father of His Country at Valley Forge. It remained at the Capitol for a few years, but is now at the Smithsonian Institution.

THE suffrage group which one critic said made the women look as though they were emerging from the tub.

ANDREW JACKSON, the first equestrian statue made to stand on its own hind legs.

THE LIBRARY OF THE
UNIV OF ILLINOIS
URBANA ILL

"UNTIL the great continent of America permitted peaceful and almost complete disruption of the folkways of the peoples from which the American colonists had come . . . . . the shell of old societies had always to be disrupted by violence in order that the society that had formed within them might come consciously into being. In the five generations since the new American society came into being, numerous new European, South American and Asiatic societies have, by violence, broken the shells of the societies within which they had formed . . . . . Change should never, henceforth, have to be sudden, violent, mechanical. It should be slow, continuous, organic."—JESSE LEE BENNETT—*The Essential American Tradition* (G.H.Doran Co.,N.Y.).

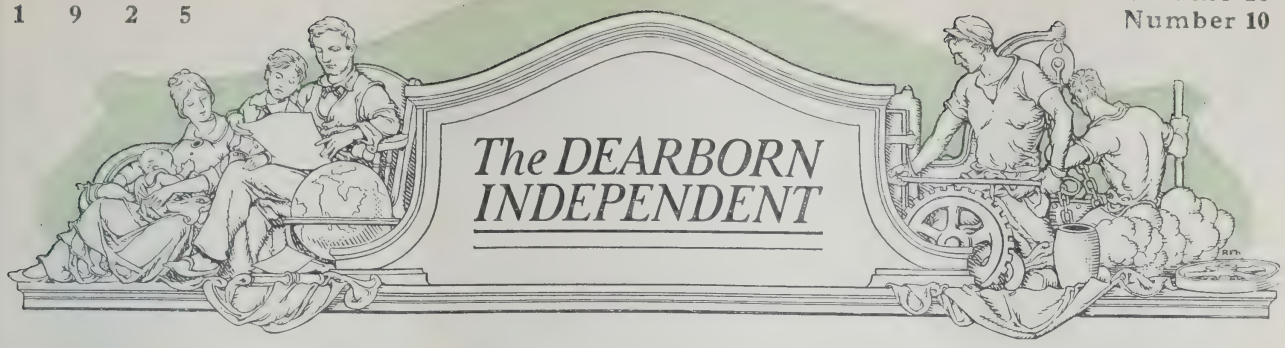
CHRONICLER OF THE NEGLECTED TRUTH

# Motors Shafts Machines

Power is applied with Timken Tapered Roller Bearings in electric motors. Power is carried on Timken Bearings in shaft hangers and pillow blocks. Power is at work in Timken-equipped machinery of every sort.

Along the whole path of production Industry economizes with Timken Bearings. They remove the drain of excess friction. Starting and running load is less. Lubrication becomes a petty item. Output is increased and improved.

Basic charges also shrink. Lighter power units and lighter belts are possible. Depreciation is halted by the faultlessly preserved position of Timken-mounted shafts, gears, and pulleys. Replacement is postponed by the extreme endurance of special Timken steel.



Throughout industry Timkens are used more and more extensively. In every type of plant Timkens can be used more and more intensively — for economical prime power, for economical power transmission, for employing power economically in every type of mechanical equiment.

# The Essence of This Issue:

Mr. Ford's Page this week is a discussion of the two ways of winning wisdom.

We definitely guarantee that if you read this week's DEARBORN INDEPENDENT you will be a more widely informed person; you will have a deeper reservoir of thought-stuff; you will have a broader vision.

First comes a Big American Story—one that has been much neglected. The Teapot Dome exposure began with a little country editor down in New Mexico. It cost him his liberty, it nearly cost him his life, he is now indicted for murder. A sensational disclosure of conditions in that part of the country. A proof that truth is stranger than fiction. Read this Carl Magee story and see what can happen in one corner of this country. (p. 2)

Mr. Coolidge, when a boy, made wooden cabinets. The work was carefully done, but the material was quite ordinary. That's one thing. Another: Calvin Coolidge doesn't know a thing that President Coolidge intends to do. His official self has no confidences with his personal self. That is what this publicist says, anyway. (p. 4)

Why not camels of the prairies? A sensible question before the motor car era. Even in the Sahara the motor supersedes the camel. But 70 years ago Jefferson Davis, then United States Secretary of War, introduced camels into Texas. (p. 19)

Can every race use democracy? Or is democracy a racial trait? It is probably right to say, the race that achieves democracy is worthy of it. Popular government works well among those people who evolved it. If it fails among those peoples who never grew it, does it not indicate the racial quality in democracy? (p. 7)

Emma Lyon was a nurse-girl, whom a medical charlatan made Vestina, Goddess of Health, and whom fate made Lady Hamilton, and whom Admiral Nelson made his affinity. Somehow, her inclusion as a "romantic rascal" seems harsh. But let that be. Many people have heard of Nelson's Lady Hamilton who have not heard her story. (p. 21)

Here is a stirring tale of the lure of gold—not of money, mind you, but gold. How can we measure the lure of gold in drawing men far abroad to inhabit the waste places and make them flourish? "The gold rush," the "gold fever" have been events of tragedy and glory, but always of immense historic and social significance. (p. 12)

The great nation to the north of us retains very dignified parliamentary forms; indeed, the royal system remains with many a colorful and impressive detail. Yet within this stately form the plain people practice an effective self-rule. (p. 24)

Is there a yellow race? Some say, yes, at once. Others are not so sure. The rising interest in race makes the matter important. There is reason to believe that the biggest racial discovery science has made is that we still have practically everything to learn about race on the biological side. On the historical and language side we know enough to cast doubt on much that has been taught us. One thing that a racial consciousness brings is a sense of relationship that overflows nationalist barriers. Too long have people of the same race fought each other in the belief that national borders made them a different people. (p. 5)

Professor Karpinski says that the principles of Americanism are Puritan and were documented for the first time by the Pilgrim Fathers who were, to all intent and purpose, what is meant today by Puritan. They gave form not only but character to America, and so it has remained and will remain. A study of the first appearances of American principles in formal writing. (p. 29)

China, now a land of unrest, is still the land of vast romance. China's Drum Tower is the subject of one of Mrs. L. M. Cramer's articles. (p. 8)

# He Licked Fall in His Own Paper

## The Man Who Blew Up the Teapot

Honest editor—Sunday school teacher, now indicted for murder—starts exposure that amazes the nation.

By WILLIAM L. STIDGER

CARL C. MAGEE.

"DID you ever hear of Carl Magee?" a western friend asked me.

"Carl Magee is the fellow who smashed the Fall political ring, accidentally killed a man in doing it, a fellow who teaches a Sunday school class, edits a paper, and is credited with starting the famous Teapot Dome investigations—here's a man—look him up!"

I looked him up for an interview. He was coming through Kansas City. He had just returned from burying his son, Carl Magee, Jr., whose airplane had fallen two weeks before in Tulsa. He is tall, angular, dark-skinned, with deep-set eyes and shaggy hair; most people would think of Lincoln at first glimpse of his face.

He comes of an unusual family, of the quartet of Magee boys. One is a Methodist minister in Kansas City, one a Methodist minister in Seattle, one a millionaire oil operator in Oklahoma, and Carl Magee, the subject of this inquiry, is an editor.

When I interviewed him, this battling giant was a bit broken. Now and then, as he talked of Carl, junior, his strong jaw trembled a little, his deep eyes filled with tears. I found it hard to believe that I was talking with a man who had been the storm center of a nation's fight for freedom of the press, and the rights of the common people; a man who had fought one of the most strongly entrenched political rings this nation ever knew, a ring backed by the assets of one of the richest oil companies on the face of the earth. I could hardly conceive of this quiet-voiced man having fought with his fists, battling his way through unfair trials, suffering personal assaults time and again, jailed and bruised; now under indictment for murder because a stray shot from his gun in an unprovoked altercation and assault killed a boy who was trying to help him.

As we sat in his preacher brother's study one would have taken Carl Magee for the preacher, and his brother for the editor and the fighter. It was when Carl Magee got to telling of how many friends he had in Tulsa, Oklahoma, where his son fell to his death, that the break came in the features of this iron man.

"We had lived in Tulsa for years before I got into this Fall fight. We had to go to Albuquerque for my wife's health. I don't care much about anything but my wife and children, so we gave up everything and moved."

I learned from his brother what the "everything" phrase really meant.

Carl Magee had a large part in starting the school system in Tulsa. He was president of the Y. M. C. A. He was on the school board from the time the system had seven teachers until it had a hundred teachers. He was always on the board of the Chamber of Commerce. He went to Tulsa when it had a population of 1,800 and he left when it had a population of 125,000. He taught a men's Bible class in Tulsa for years.

Then started the story that the American people should know. Carl Magee told it in jerks.

After burying his roots deeply in the soil of Tulsa it was necessary to leave his lifelong friends and go to Albuquerque for the sake of his wife's health.

What was he to do now? Buy a newspaper, and try out some ideas he had been working around in his head. Tell the truth in it and see how it would work.

Curiously enough he bought his first newspaper from Albert B. Fall, of Three Rivers, New Mexico. Fall has had many an hour to regret that sale. Fall evidently was not a good reader of character or he might have known that a man with the Magee chin could not be bossed, could not be intimidated, could not be bought.

But Magee could not buy that paper without going to New York to see the real owners. The Albuquerque *Morning Journal*, he learned, had been purchased by a group of railroad men for the one purpose of electing Albert Fall to the United States Senate. With that little task successfully completed, they didn't have any further interest in the paper. It had served its purpose; it was in the market for sale.

"It cost me $115,000 to get that paper and $25,000 of the money went to Fall himself. I had to borrow from the banks to swing the deal," said Carl Magee.

"Fall was anxious that I should get a good start as an editor so he told me the inside dope on the political situation in New Mexico.

"He told me that New Mexico was two-thirds Spanish-speaking; that the juries are made up nine-tenths of Spanish-speaking persons; that in a trial all English-speaking witnesses must have an interpreter to convey their testimony to the jury; that most white men, 'even a white editor' if he gets into trouble, have to be tried by a Spanish jury. There was a curious threat about this statement of Fall's. He told me that the whole political ring was in New Mexico based on the old Spanish Don system. New Mexico, he explained, had been preëmpted by these Spanish Dons who had kept the peons and Indians in subjection for years. There are certain water holes in New Mexico and the man who controls these water holes controls the votes, for the common people must have water for life and soil and other things necessary for subsistence.

" 'And just as the Dons control the voters, so we control the Dons,' Fall said. 'We have learned how. We do just what we —— please in this state.'

"Needless to say, I went away from that interview disgusted with Albert Fall and the system of political dishonesty and exploitation of the people of New Mexico. I resolved that I would seek the truth about this iniquity and expose it to the world if it killed me—and it has nearly killed me several times."

"What do you mean, that it has nearly killed you?"

He answered quickly: "I mean that I have been beaten within an inch of death several times. I have been shot at. I have been in prison—and I am now under indictment for the accidental death of a boy who was trying to defend me when I was attacked by an ex-judge whom I had defeated for reëlection. It began with Fall.

"I had hardly got the paper in my own hands when I attacked the management of the land office because it was not run honestly. The end and aim of that land office was to help the political machine.

" 'Fall will get you yet if you don't watch out!' said some friends. They had hardly given me this warning when Fall himself roared into my office like a New Mexico cyclone. He banged one of my editorials down on my desk and shouted 'You lay off this! You lay off this!'

"I told him to mind his own business; that the paper was no longer his.

" 'That's all right. But you lay off of this land office or you'll be smashed to bits—just as if a train had run over you!'

Office building *New Mexico State Tribune*, Albuquerque.

"I knew that I was in for a real fight. But I did not know what a cut-throat crowd I was battling. I didn't know that they would stop at nothing; that murder was a favorite weapon; and that imprisoning a man with a crowd of Mexicans and having his eyes gouged out was one of their pet stunts; since it could be covered up by reporting that this gentle accident had happened in a jail brawl. The full truth of it came sooner than I expected, as you will find later in my story.

"One night I was driving in my machine when a man with a rifle stepped up and stopped me. I thought he was an officer.

" 'Come with me, you —— skunk!'

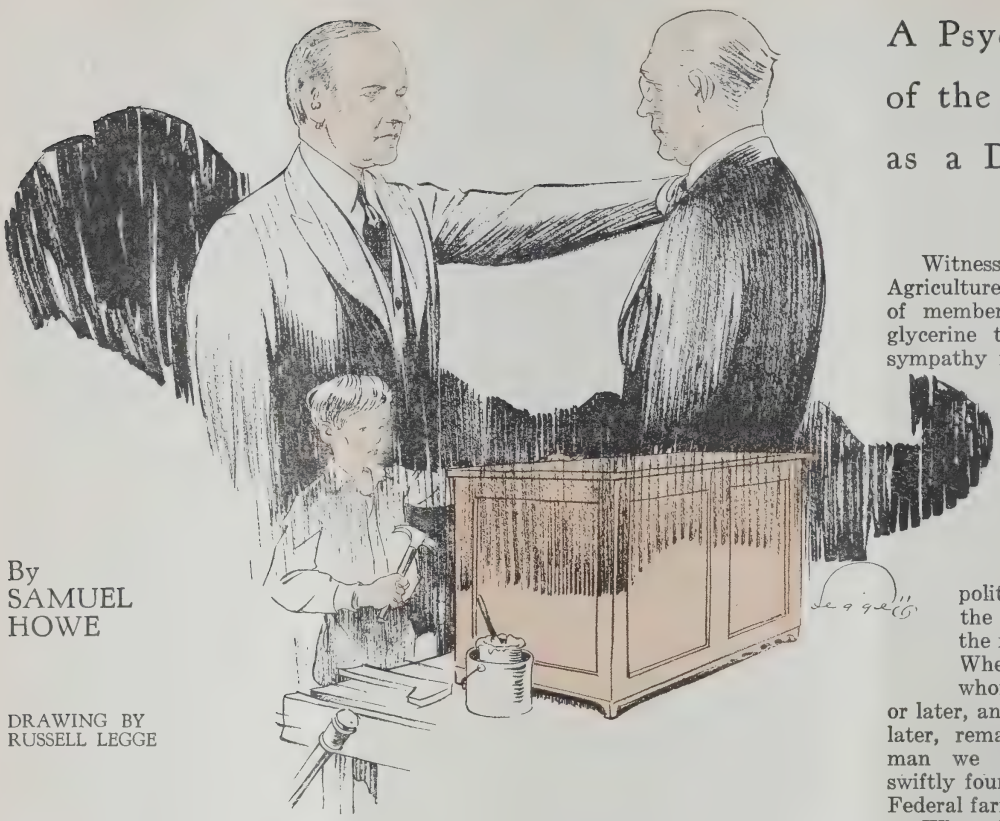
"I didn't move but said: 'Are you an officer?'

" 'Come on or I'll fill your —— hide full of holes!'

" 'It's more comfortable here in my own car,' I said to him, and at that minute another automobile came swinging around the curve.

"The fight was on all right and I was hounded at every turn. I kept up my running fire of editorials. One day I took my little daughter who was then eleven to see the capitol building in Santa Fé. As we walked through the capitol building a big husky fellow, employed in the building, without warning, hit me on the jaw. I sailed in. Nobody tried to stop us for everybody there knew what he was trying to do and who had told him to do it. That time I got the best of it—but not in the rest of the fights.

"They tried to 'get' me through the banks. They knew that I had borrowed heavily. Once notice came from the bank that a note I had for $60,000 would not be renewed. I went to my subscribers, told them that the gang was trying to shut me up and now had got at me through the banks. I took my troubles to the people like this five different times, asked them to buy bonds at $250 each, and every time they saved me from the banks.



"Fall was back of this attempt to foreclose. He had promised to smash me, but he didn't succeed that time because the people stood by me. They felt that at last they had a champion. Five editors had been crushed preceding me.

"I didn't state things in a general way; I made them specific. I said: 'Mr. ———— (naming him by name) has embezzled three thousand dollars of the state's money and I can prove it!' That gave the

# The President and Mr. Coolidge

## A Psychological Study of the Chief Executive as a Dual Personality

IN THE very early eighties a little ten-year-old Yankee boy made a little cabinet.

Other lads might content themselves with building miniature boats or carving watch charms out of peach stones, but this lad was by choice a cabinet builder. He selected and matched every bit of wood that was used. He made sure that it was all sound, free from knots and other imperfections. He alone planned the four full-width drawers, with two above, side by side, each half the width of those below. It was his throughout, every bit of it his own doing. His father still cherishes that cabinet. It was the work of his little son.

The ten-year-old cabinet builder is now the President of the United States. He has had to deal, and still deals, with cabinet-making difficulties far more harassing than those he solved in his boyhood. He couldn't build "from the ground up." He had to take over a job of another's planning, "as was." Some of the wood already in place was warped, knotty and unsound. He had to patch here, and cut out there, and replace. A good workman, taking joy and pride in his craftsmanship, President Coolidge must often have yearned for the freedom of circumstance he knew when, at the age of ten, he was building a cabinet.

Wherefore it is that when a piece of his cabinet drops out of the frame or is pried out, President Coolidge raises circumspection to the *nth* degree. It is true that when President Harding died and Mr. Coolidge succeeded to the presidency, he didn't give Secretary of the Treasury Mellon a chance to go through the accustomed form of submitting his resignation. Mr. Mellon at the time was in Europe and President Coolidge promptly cabled him to the effect that it was his duty to the people of the United States to remain at the head of the Treasury Department.

President Coolidge acted with celerity in that case, but his White House disposition never has been what could be defined as confiding or impulsive. If there are any who feel able to testify that the President is forever pursuing them with his confidence and eagerly whispering his secrets in their reluctant ears, let them hold up their right hands and be forsworn. The opposing fact is that the President doesn't even tell his secrets to Mr. Coolidge. The President can come to a decision, tuck that decision away in one of his neatly arranged mental presidential compartments and let it remain there, hidden even from Mr. Coolidge, until he is ready to take it out for renewed examination. So he guards against even telepathic intrusion.

Witness the case of Secretary of Agriculture Jardine. When a number of members of Congress, moved to glycerine tears by their professional sympathy for the farmer, were introducing bills for the suspension of the arithmetical tables and providing that "two and two shall make five," Mr. Jardine stood erect on his Kansas heath and answered the "what-shall-we-do-for-the-farmer?" political shrieks by saying that the best thing o do for the farmer was to let him alone. Whereupon Mr. Hoover, to whom all things come sooner or later, and usually much sooner than later, remarked aloud, "Here is the man we want," and Mr. Jardine swiftly found himself functioning on a Federal farm commission.

When there came a vacancy in the Cabinet and President Coolidge faced the problem of choosing a Secretary of Agriculture Mr. Jardine was nobly indorsed and extensively reindorsed. He came to Washington to appear before the House Agricultural Committee, then holding hearings at the instance of the political "for-Godsakers." The news began to seep around Washington that Jardine was to be appointed. The Kansas crowd felt very sure of it. Mr. Jardine himself began inquiry about Washington house rents and the price of round steak. When the President sent for him, as he did, the Kansan had a neat little speech memorized, based on the well-known formula, "I accept the appointment as a call to service." He didn't get a chance to deliver it. The President talked about the farmers and Jardine talked about the farmers, but nobody talked Cabinet. The President would not and Jardine could not.

Only a professional and highly trained psychologist could do interpretative justice to Mr. Jardine's disappointed state of mind when he packed his suit case and started back to Kansas. Only such an expert could properly analyze Mr. Jardine's reflections as he counted the telegraph poles flying past and thought of the frailty of human hope, the inutility of political ambition. It was only after Mr. Jardine had carried the carefully wrapped remains of his expectations clear back to Kansas that announcement was made at the White House that Mr. Jardine had been appointed Secretary of Agriculture. Secretive? President Coolidge? Not so! To be merely (Concluded on page 20)

The origin of the so-called "yellow race" has been for centuries one of the greatest ethnological puzzles. Now comes a celebrated Sinologue, who has spent the past quarter of a century studying the Chinese in China, with the flat declaration that there is no yellow race: that it and, probably, the red also, are merely mulattoes, modified by inbreeding of ages. The majority of ethnologists and anthropologists, however, still hold that there are three main divisions of man—white, black and yellow.

This article will be read with interest by readers who wish to be up-to-date on this important question.

# Is There Such a Thing as a Yellow Race?

By JOHN SLOAN

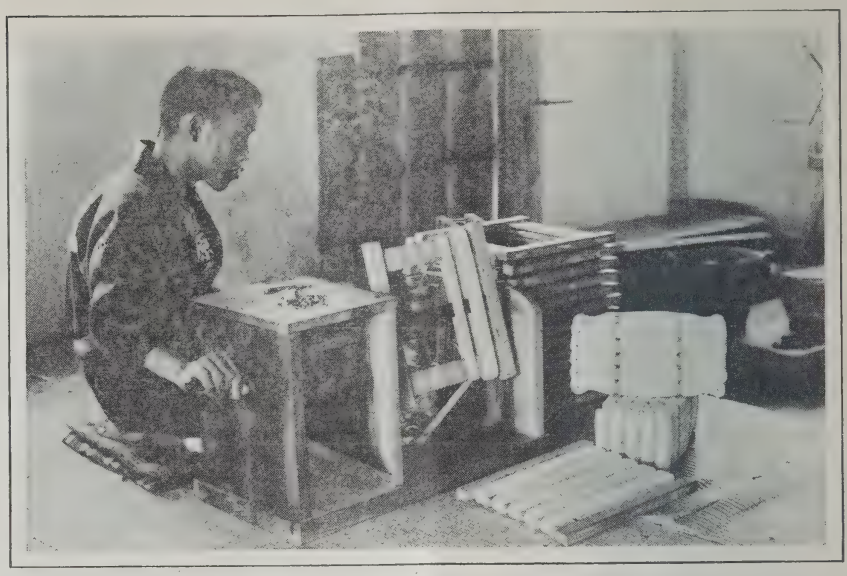
TWENTY-FIVE years ago a small man with letters enough back of his name to start a new alphabet went quietly out of the University of the Sorbonne, in Paris, with a one-way ticket to China. Reaching Hongkong, that man disappeared into the interior, and, with the exception of a few widely separated and brief visits to the outside world, he has been there ever since. On foot, on muleback, on canal boats and on camels, he has traveled more than twice the distance around the world, all in China. He has been the first white man to visit more remote tribes than he has fingers and toes. He has surmounted mountains and deserts and rivers, and not even revolutions nor civil wars were able to stop him. By what seemed a common consent, governmental and revolutionary leaders passed him, while bandit chieftains helped him on his way. Lordly Manchus and lowly lamas alike gave him assistance and he learned the great Gobi Desert and the twisted trails of the mountains of Tibet as well as the streets of Pekin.

The objective he sought was knowledge of the source of the Chinese as a race. He wanted to learn whence came the yellow man, and by what ethnological roads he arrived. In the quarter of a century of his study he has penetrated every province and has visited every town of more than 500 inhabitants in the vast republic, which he saw change from an empire overnight.

Now, in 1925, he has come out of China, with the results of his study—results with which probably few ethnologists will agree, yet which are as interesting as is this man who has passed twenty-five years out of the middle of his life alone in the midst of four hundred million people not overly friendly to the white races of the world.

His name is A. Legendre. He prefers to be known merely as a Sinologue—a student of the Chinese and their culture. Certainly, he has earned his right to this title, but he is going back to China, to learn more of the Chinese than he has been able to learn in the years since 1900. Yet he seems to have gathered enough to set the scientific world arguing until he returns again, even though it be at the end of another quarter of a century.

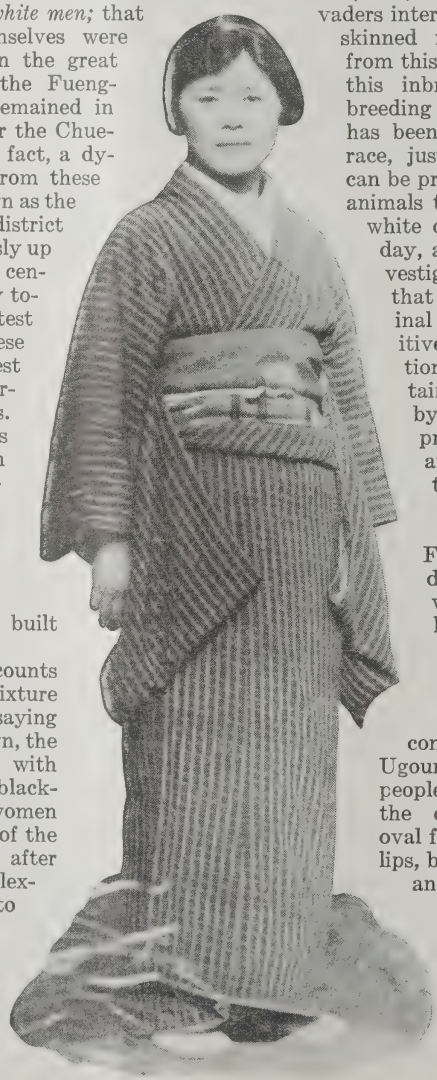
"There is no such thing as a 'yellow race,'" he says. "There never have been more than two divisions of man—the black man and the white man. The so-called 'yellow man' is merely the product of centuries of mixture of whites with blacks, blacks with the resultant half-breeds, and whites with the cross productions of all three. In other words, the 'yellow race' is mulatto, as is also the 'red race,' long believed to be an offshoot of the yellow. The original Mongol was a white man; the Mongol of today is a mulatto."



There are as many types of mankind in China as there are tribes, according to Dr. Legendre, and he has carefully limned—on an ethnological map—the comparative size, extent and number of each group. In Yu-Nan, he found the predominant Chinese to be white of skin, with long heads, thin, high noses, and an abundant growth of hair on their faces. In the lower part of Mongolia, the eastern end of Tibet and the northwestern section of China proper, he met with men and women almost pure negroid in color and characteristics. These people, few of whom are more than five feet in height, have dark skins, flat noses with the "cut-out" nostrils typical of the Negro, and hair "kinked" like that of the black man.

Outline map of the Chinese Republic, showing the areas of white, black and mulatto predominance in that country, including part of Eastern Turkestan and the northeastern section of Tibet, according to the results of Dr. Legendre's study of the so-called "yellow race" in all parts of China.

It is Dr. Legendre's opinion that all the people of China—and the other so-called "yellow races"—have passed through these transitionary stages, on their way from the original white and black stocks to their present yellow, brown and red colors.



"In Shan-si Province, extreme Southern Mongolia, which has forever been the main route of migratory peoples moving both east and west through this part of Asia"—writes Dr. Legendre, in *L'Illustration*, of Paris—"I found that the people, prior to the Christian Era, and for the first century of that era, had suffered repeatedly from invasions by an enemy from the north whom they called 'Hion-Nu.' These were the Huns, thousands of whom settled in this section, and of whom more than 200,000 were slain by orders of the Mongol general Chue-Min, about A. D. 350. The records of this massacre say that these Hion-Nu wore beards and were blue-eyed."

The Japanese have traveled far from the original black-and-white cross which resulted in the so-called "yellow race," but here is a Japanese whose face and hands still present some evidences of remote negroid connections.

Further material gathered in this valley leads Dr. Legendre to say that Genghis Khan, Tamerlane and Attila, as well as other leaders of the migratory raids from the north into China and Europe, *were white men;* that the Mongols themselves were white, and that, in the great central valley of the Fueng-Ho River, Huns remained in numbers, even after the Chue-Min massacre. In fact, a dynasty descended from these Hion-Nu, and known as the Yuans, ruled this district of China continuously up to the late fifteenth century. In this valley today exists the greatest number of Chinese showing the strongest Aryan (white) characteristics and traits. For centuries, hordes of white men from Northern and Eastern Asia hammered on China, invading that great country and becoming absorbed into the vast mulatto race being built up there.

The explorer accounts for the original mixture of the races by saying that, as is well known, the invaders brought with them thousands of black-skinned men and women as servants; others of the black race came in after the movement of Alexander the Great to the banks of the Oxus. These blacks mixed with the tribes they found in China, and, in turn, the white invaders interbred with the light-skinned mulattoes resulting from this cross. Centuries of this inbreeding and cross-breeding have produced what has been named the yellow race, just as spotted cattle can be produced from parent animals that are either pure white or pure black. Today, according to this investigator, virtually all that remains of the original China and the primitive Chinese, is tradition, folklore and certain customs, still kept by the mixed bloods produced by the white and black penetrations.

Japanese woman who shows no indications of admixture of black blood, except for the minor factors of a nose flattened at the base and rather thick lips.

Dr. Legendre points out that the Duke Fa-a, founder of the dynasty of Tcheou, which endured nearly 800 years, from 1050 to 256 B. C., maintained himself by, and left to his successors, an army composed of Turks and Ugours. Both these peoples are white, with the characteristic long, oval faces, thin noses and lips, blue, horizontal eyes, and a tendency to beards. They added their quota of white blood to the mixed racial structure being built up in China. The Emperor Che Hoang Ti, founder of the T'sin dynasty, was a Sarmat (Persian) and he maintained a large entourage of his countrymen at his court, whence many of them spread white blood through China.

"After the opening of the Christian Era," says Dr. Legendre, "China was divided a number of times by white tribes from Mongolia and Manchuria. The rulers of the districts of China, in an effort to conciliate these warlike descendants of the Huns, gave the white men huge grants of lands and other concessions, as well as to the Turko-Iranians, who also invaded the country." The newcomers settled on these grants, made millions of unions with the women of the country, through whose veins black blood flowed, and thus still more white racial influence was added to the Chinese. Traces of these Turko-Iranians and of the Semites as well can be found to this day in Shan-si and throughout Northern China, particularly in Upper Mongolia and Manchuria.

"This enforced penetration of the white race into a country largely peopled by mulattoes and negroid peoples, was not only military," continues Dr. Legendre, "but also affected learning and religion. The first century of the Christian Era saw the introduction of Buddhism into China, and a general transformation of the arts in that empire. Recent discoveries in Chinese (east) Turkestan, and in Ho-Nan, Central China, indicate that it was through Hellenic influences in these sections that Greek art was first introduced to China, India and Japan. It is well known that Alexander the Great was responsible for bringing the Greek masters of art and music to India. Again, in the fourteenth century, there was a renaissance of art, literature and poetry, which we are now able to prove was promoted by Kublai Khan, the Mon-

(Concluded on page 28)

# Democracy Not for All Races

## Some Countries Respond to Popular Government; Dictatorships Succeed in Others

MOST political thinkers have long rejected the idea that democratic forms of government can be successfully applied to all races of men. Undoubtedly no small part of the post-war chaos in the Orient has been the result of the unwise work of American and ally propagandists during the war, who preached democratic formulas to the "lesser breeds" to counteract German propaganda.

***Democracy in Other Races Is Different***

But the problem of democracy in relation to the other races is something quite different from the problem of democracy in the West. The new skepticism is growing and acquiring formidable credentials, but I believe it is based on a misconception of the problem.

The new doubters of democracy in Britain and America have been pointing to the violent revulsion against democratic forms and methods in Russia and Italy, the growing atrophy of political parties and the creeping paralysis that has attacked legislative bodies even in the homelands of parliamentarianism.

If these manifestations are analyzed, however, the failures of popular governments to solve post-war problems will be found not to inhere in democracy or constitutionalism. There is no reason to lose faith in popular government *among those peoples who evolved it.* If it is not working well *among those peoples who never grew it,* that proves what has been known all along to those who have looked below the surface. Popular governmental forms in Eastern and to some extent in Latin countries have never had any deep significance. Underneath the *imported* parliamentary institutions of Latin countries, the old social framework coming straight down from the Roman Empire and embedded in the still dominant Roman law and police system survived. Government has been personal and dictatorial where efficient in such countries. Mexico did well under Diaz and Italy will probably live under Mussolini, because Caesarism is in the blood of the people and imprinted on all their social customs and institutions. *Popular government is the product of racial habits as expressed in racial traditions, manners and methods.* It cannot be created by conventions, documents, or fiat.

***The East Side Oligarchy Which Rules Russia***

The oligarchy which came up from the social sewers of the East Side of New York and imposed itself on the Oriental masses of Russia, after ousting the outworn Romanoff dynasty and its mush-minded successors of the Kerensky régime, has had to ask truce and charity of the popular governments of the West, whose destruction it proclaims.

* * *

Many modern discoveries turn out on examination to be new forms of stating old knowledge. The fact that the army mental tests showed that a huge majority of individuals possess only mediocre intellectual powers in comparison to the dynamic minority who lead, is *not* a *discovery.* It merely states in more or less dubious mathematical form a fact that has always been true. Men of sense have always been aware of it—however little many may have esteemed it expedient to emphasize the fact. Men of executive ability and with the gifts of leadership have always been keenly aware of the fact that the majority must be *led,* but they have also realized that one of the best ways to *lead* is to *enhance the faith of the led in themselves.*

Popular government in America has worked rather well for a century and more. It has worked well in Western Europe. *There is no reason to believe that the percentages of intellectual ability revealed by the army mental tests have varied much since Runnymede or the Long Parliament.* Here and there in America, principally in the cities, where the deluge of new peoples who have never evolved the habits of self-government has swamped the earlier types who had, democracy may be breaking down. But its failures are not due to the "intelligence ratings" of the newcomers, be they better or worse than those of the older breeds. The cause of the change is found in their different racial traditions, emotions, habits and *modes* of thought. This brings us to the core of the whole matter. *Success or failure of popular government is not primarily a matter of INTELLECTUAL capacity.*

***Success or Failure Not a Matter of Intellect***

Democracy does *not* depend on equality. If it did it would never have come into existence. For *equality* of intellectual endowment has never been even remotely approached by any group of mankind. The manifold chances for individual variation inherent in the modes of hereditary transmission of human characters make equality impossible.

Popular government—the rule of the majority—the determination "by the people" of the rules to be followed in the game of life—is a perfectly feasible scheme. Psychologists who are now stressing the inequality of individual intellectual capacities are forgetting the equally important discoveries made some years ago of the *startling equality of value in mass or group judgments.* Government is a matter of the mass—and hence the psychology of the group is of more importance in relation to politics and government than the psychology of the individuals composing the group.

Men acting in groups have a group psychology which is a distinct entity from the psychologies of the individuals composing the group. This is a difficult concept to grasp, but there is nothing better established in the whole realm of science or practical experience. The mental processes of a mob, a crowd, a nation, a congress or a jury are not the sum nor the composite result of the usual mental processes of the individuals composing those groups. Men in the mass reach a common level of mentality, because they inherit in common a large fund of ideas and feelings which are common to all the members of a race, just as the pigment of their skins or the shape of their skulls. Men acting as individuals display profound differences in intelligence and in mental processes and results.

***Democracies Get a Whack at Important Issues***

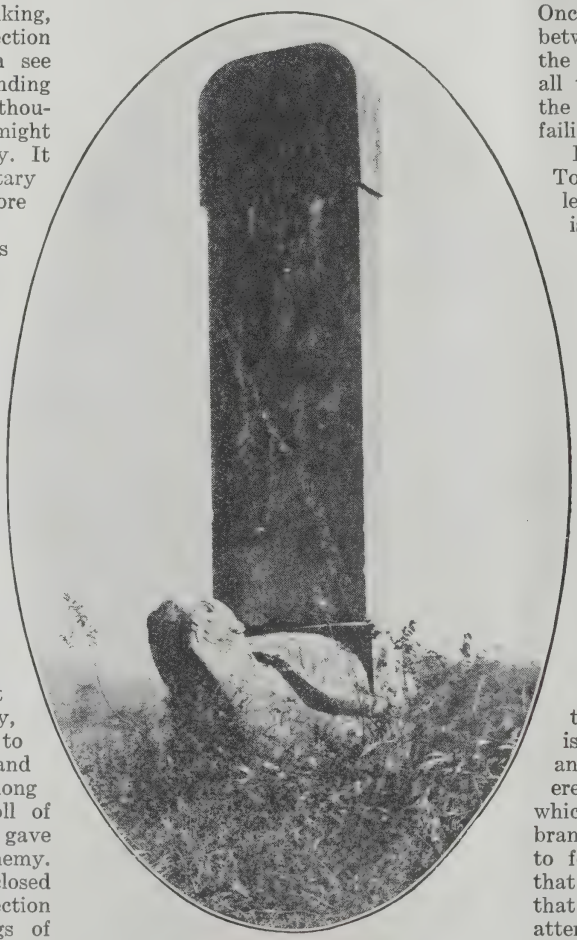
Men acting in groups—no matter what their individual capacities and processes may be—achieve results that are startlingly alike. There are laws of uniformity in such crowd action, some of which are being worked out by scientific investigators. It is certainly true that crowds approach equality as markedly as individuals display inequality.

But no matter how efficient professional politicians may be, in the long run democracies always get a whack at the important issues with the disguises stripped off. Then they settle them and settle them right. Democracy like the law "treads with leaden heel but strikes with iron hand." Certainly it is slow, but this very inertia is one of its virtues. If it *does* less than the more mobile autocracies and oligarchies, *it has much less to undo.* It has fewer achievements to its credit, so it has fewer mistakes and no disasters. Democracies have rotted from the moral decay of their peoples, but there is no record of a Democracy committing suicide in the fashion recently exemplified by the Prussian military order or the Czarist bureaucracy.

***Popular Instincts Prevail Over Propaganda***

This explains the apparently uncanny manner in which the popular instincts of the American people have prevailed over propaganda.

# Mingling Modern with Ancient in China



FROM one end of China to the other can be seen the splendid monuments of a bygone age, crumbling into decay for want of a "stitch" in the shape of repairs which would have saved China's wonderful old structures—temples, pagodas, city walls—to delight future generations. The exceptions to this rule have been very few, and usually, when repairs have been undertaken, the Chinese have made the mistake of modernizing whatever they have sought to repair, and the result has been ridiculous.

Take the Drum Tower of Nanking, for example. From every direction within the city walls one can see the massive Drum Tower, standing atop the hill known as Kulou. A thousand times I have wished that I might see it as it was in its greatest glory. It was erected in 1092 by military slaves of Che-tsung, 400 years before the discovery of America.

When the Drum Tower was new, it was used as a watch-tower, to guard Nanking against a surprise attack from an enemy horde. It also controlled the genii of wind, rain, thunder and lightning. The Augustan Sung, monarchial Yuan, magnificent Ming and autocratic Tsing dynasties, each in turn used its shrine for geomantic guidance. Marco Polo, in 1272, St. Francis Xavier, in 1528, and the elegant Ricci, in 1581, noted it, immortalizing its massive structure and unique architecture. Throughout the centuries poets and kings have added to its romance and fame.

The Drum Tower was built for military purposes primarily, but for two centuries no alarm to arm was sounded from it, and then, suddenly one night, the long silence was broken, and the roll of drums, sounded from the tower, gave warning of the approach of an enemy. The thirteen city gates were closed and barred. For further protection they were barricaded with bags of sand. Battalions of soldiers were posted on the city walls. From the Drum Tower the Ming, Tai Dzu, watched the battle between the two armies which took place near the river below, encouraging his men to victory by incessantly beating the great drum which gives the tower its name.

In times of peace the great drum was beaten through the night, once at sundown, once at sunrise, and at regular intervals to count the night watches—five times in all. It was also beaten to announce the approach of ambassadors and visitors of state.

The great stone turtle of Nanking.

But today its glory is spent. Today it is strung with electric lights. Its convex roof at night glistens with these lights—myriads of them—reminding one of the roofs of the places of entertainment at Coney Island.

A great stone turtle rests on the grounds of the Drum Tower. The turtle was erected by the people of Nanking more than four hundred years ago, commemorating a visit made by Kang Hsu. There is one story to the effect that the turtle was brought here for the purpose of obstructing the flow of intellect toward Soochow. Once there was great intellectual rivalry between Soochow and Nanking, and the former's candidates were winning all the honors in examinations, while the scholars of Nanking were steadily failing.

But these tales are of long ago. Today's story is different, and no less interesting. Today the turtle is held sacred by the majority of the people of the city, because of its supposed life-giving properties. These people go to the image when their children are ailing. They give their suffering little ones to the spirit of the turtle, symbolizing this by tying a cord about the neck of the creature, in the belief that death will not touch the child of so sacred an object.

There are other minglings of the ancient and modern in this old city, almost equally incongruous. From my east window I can look over to the campus of the University of Nanking. It is a Christian school, a mission school staffed about equally by foreign and native teachers. A new science building is being erected on that campus, and above the masonry have been erected great poles, to the top of which are fastened bunches of foliage—branches from bamboo trees. This is to fool the evil spirit into believing that a great forest has sprung up on that spot. An evil spirit will never attempt to go through a bamboo forest. The president of that university has vainly urged the folly of this.

# MR. FORD'S PAGE

THERE are two kinds of wisdom. In olden days they were called "the wisdom from above" and the wisdom from beneath. This description led people to think that the quality of one was good and of the other bad. But there is no bad wisdom. Any kind of error, whether of moral or method, whether intentional or knowing, is the negation of wisdom. There are no wise evildoers of any kind. They may be knowing, they may be clever, they may be "smart," but they are not wise. And on examination they are not so knowing nor so clever nor so smart, at that!

The older people, in noticing the two kinds of wisdom, or rather the two directions from which wisdom comes, thought that "the wisdom from above" was a mysterious gift from heaven, while the other was the product of more earthly levels. Of course, in all these things there is truth, if we can find it.

The "wisdom from above" that seems to be a gift is exemplified in the men who know without seeming to have to learn. Some men see through a situation where others see only as far as its first difficulty which to them seems insuperable. Some men get in a flash the secret of a situation while others are laboriously assembling its elements to find out what the situation really is.

The one knows; the other is learning.

This difference between men is often quite independent of their experiences since birth, or of what we call their "opportunities." We see men with hardly any experience at all, and sometimes with less than usual knowledge, exhibit a wisdom of attitude and judgment and action which compel a following. And then we see men who have had every opportunity to acquire experience and knowledge show by their actions that these do not constitute wisdom in any sense.

It is not possible reasonably to conclude, however, that the first class has never learned, or that the second class is not learning. One has arrived at a certain maturity, the other seems to be on the way. And this without any reference at all to their position in life.

With reference to the matters we have been discussing in this Page of late, namely, the ease with which some people are gulled, this distinction of wisdom has a practical application. Some people simply know fraud and impossible business judgment when they see it; others seem to be under the necessity of learning by painful contact with it, as a child learns the nature of fire by being burned.

That which is called "the wisdom from above" seemed to be the stored essence of previous experience; it has been attained and is ready for use. The other is still being attained by the process of experience.

The question then arises, is this higher wisdom obtainable for use by all? Can the mind at need send out and get it? There are those who unhesitatingly answer, yes. They say that under various figures. Some speak of it under the figure of prayer: "If any man lack wisdom, let him ask of God, that give h unto all men liberally; and it shall be given him. But let him ask in faith, nothing wavering."

Others speak of it under the figure of wireless: the universe is full of wisdom, it is the very expression of wisdom; if men put up their receivers they will receive it. This is true in experience. The fact of the universe comprises all our science and that is ever before us, being endlessly broadcast through the world of mind, as if in search of receivers. Man seems to be the receiver, the rationalizer and the transmitter of these things. Beauty, music, design, mechanics, vital truth are not created but perceived, received, by those who have antennae in the sphere of wisdom.

Others, still, attempt to give this experience a more scientific expression and speak of man as being equipped with invisible couriers which he can speed into the unknown to bring him back reports—the traveling part of his mind which may make expeditions into the world about and discover knowledge, which applied to the common concerns enlarges the environment of all the people. One idea, and the walls of experience are pushed back and widened.

In other words, those who will only plod may plod and come upon a little wisdom by the lower road, while those who will take the high road may come upon wisdom in larger degree and earlier. The low road is a rear-guard against mind-creatures falling below their natural estate. But the high road is the way mind-creatures were meant to take, and all will one day take.

Men live too far below their possibilities.

*CONTRARY to the old maxim, there is a royal road to wisdom. Hard knocks have place and value, but hard thinking goes farther in less time. There is a high road and a low road to wisdom. All that we call science and wisdom is all about us. As the air was filled with voices unheard of by us until we put up aerials and made receivers, so is all we need to live and to know in the universe; it is ours to make the contact. Awareness of it is the beginning of contact. Desire for it furthers the process. An attitude of discriminating receptivity is the beginning of advance on the higher road to knowing.*

# EDITORIALS

## 1925—1926

REVIEWS and Forecasts are the order of the day and will be amply attended by the historians and the prophets. The past year has been a good one in the material sense, the coming year has no visible—that is, no additional visible menace on its horizon. This does not indicate that we are over the border, out of the old era into the new. The world is still plagued by men who think that we must go back. The statesmen have no other vision than the reëstablishment of that which was. The mentality that is most largely articulate today is that which would forget or ignore that anything has happened to the world. The war was a wound of which many things in the world are still dying, and are not to be saved by any means whatever.

Most of the world's past fears of change have come of the long experience that change brought physical suffering. Changes are coming upon society but there is no indication of their being accompanied by hunger and homelessness. These things are not the necessary concomitants of change, though they are the inevitable consequences of destructiveness. Among races whose instincts are right and whose intelligence is sufficient for the task, the home fires are kept burning and the useful and necessary employments of life are maintained through the most epochal changes. Here in America it is impossible to foresee the daily life of the people break down.

This needs to be said both for the comfort of the fearful and the routing of the crass materialist who fancies that the world is safe if only the old order can be recaptured and set up again. It will not be set up. It will be thrown down more and more. And the more it is thrown down the more will the ideal-material age come in. Both our idealists and our materialists, in their separated status, are untrustworthy; the one forgets the source of his supper, the other forgets his soul. Both are one-winged things that can get nowhere. All the idealism we have is matter-based and all the materialism we have is idea-based; they are the male and female of life, subject to a sex war in philosophy, but one and undivided in experience. The weight of today's vision rises from the world which is called "materialistic." Where it does not so rise there is retrogression, with vast and needless human suffering.

The American outlook, therefore, is not that because no changes can be seen, no suffering may be feared. Changes are foreseen but suffering need not accompany them—indeed, will not, save some madness overtake us. "There's a Divinity that shapes our ends"; the Republic will fulfill its destiny. The air is filled with confused voices, but the voice of God is not the author of confusion.

## No Opinion on World Court

THERE is still no public sentiment in the United States for the World Court. Much work is being done for it, public officials are besieged in its behalf, signs multiply that the potent springs of political action are being touched, but still there is no public opinion. The people are not asking for the World Court—to say nothing of our membership in it; they have expressed no opinion on the World Court; if the United States becomes a member of the World Court it will be as impersonal to the people of the United States as a Presidential telegram of congratulation to the King of Siam on his birthday.

That is a fact. Not all the efforts of thoroughly regimented propaganda through the women's clubs, not all the idealistic preaching of misinformed and half-informed clergymen, not all the patter of unemployed minds that mistake a propagandist scheme of thought for the mighty tramp of world progress, can change it.

It is a fact of some significance, too. Our superior propagandists no longer seek to convince the people; they bring pressure to bear on political officials. Even the World Court cannot function without the moral support of the people who constitute it, and moral support is based on knowledge and conviction; these, however, do not seem to be wanted. Votes of officials alone are wanted; it is the machinery of the court, not the belief of the people in it, that is desired. Thus, there is no popular opinion on the subject. There is hardly any newspaper opinion on it. *And Congress ought to wait for a mandate from the people—not from the clubs and the salaried secretaries and the paid propagandists, but from the people.*

The people, indifferent as they may seem, are not so; reactionary as they may seem, are not so; provincial-minded as they may seem, are not so; they rightly distrust all the rigmarole of the false prophets of this disappearing era. They know by instinct that these are not the means and this is not the spirit upon which they can rely. It takes only a normal

amount of insight to understand that the strongest, most prophetic element in this whole situation is the silent instinct of the people.

It is rather strange that President Coolidge has not waited for the word of the people on this matter before giving his support to the plan. That he has not, speaks the strength of the propaganda gas that has focused upon Washington. This is preëminently a question on which the people of the United States should give mandate, and as yet they have not.

It may be right that we should go into the World Court. It may be right that we should stay out. In either case, *it is always right that the people should give the word.*

## *The President Is "Dry"*

APART from the humors of the "wet" press (one of them recently headlining a story, "Drys ADMIT Enforcement has failed") there was something of importance in the charges of the united committee on Prohibition that although President Coolidge has spoken right forceful words on taxation, militarism and the World Court, he has not taken the same strong attitude toward prohibition enforcement, and that Secretary Mellon's position as "ex-distiller" and head of the enforcement department complicates the situation.

The charges cannot be ignored, although officially they will be. The fact is that prohibition enforcement has failed, and the failure is due to government. No amount of dignified official umbrage will change that fact. And the government would not fail if it wanted to succeed; that is firmly believed throughout the nation; for when has the government ever failed to do what it wanted to do? All these charges about non-enforcement are essentially sound.

But when it comes to charging the President with dereliction because he has not pronounced upon Prohibition as he has upon taxes, militarism and the World Court, the impression is not so sound. He might as well be asked to take a strong stand on every constitutional amendment that has ever been passed. Let the President declare his unwavering belief in woman suffrage, in Negro citizenship; let him pronounce strongly on the Fourteenth as well as the Eighteenth Amendment!

Why should he? He assumed all that in his oath. He swore to uphold the Constitution of the United States. He gives no countenance to the violation of the law. He tipples at no one's pocket flask. He has no private barrel in the White House cellar. He does not frequent bibulous company. He is Chief Executive, not chief preacher.

No, there is no charge to be leveled against the President on that score. It may be that if he regarded the prohibition question as of the importance which some others regard it, if it were occupying a prominent place in his mind, it would appear in his utterances. Probably, however, it has done even better than that: it has appeared in his acts.

It was not a happy criticism of the President, because it was distinctly amateurish and one-sided. As to Mr. Mellon, his previous heavy financial connection with the whisky business led many to say that he was not whole-heartedly for law enforcement. Mr. Mellon's actions have never given ground for these statements. It was unfortunate, perhaps, for the general impression that the enforcement of the anti-liquor law should have come under the jurisdiction of one whose interests had been so closely allied with the liquor business, but that this has militated against enforcement has yet to be shown. This is a case where aspersions should be accompanied by evidence.

## *Off Politics*

POLITICIANS have never been noted for intelligence. They play their part, and it is useful only when they are the instruments of higher intelligences with high purposes. That they are now the instruments of higher intelligences is unquestionable, but that these are motivated by high purpose is somewhat to be doubted. Left to themselves, however, politicians sink to their own plane.

The Republican party leaders have learned nothing. Their ostracism of young Lafollette and the western Senators and Representatives is a piece of folly just as certain of retributive reaction as night follows day. Politicians, of course, cannot see this. "Because sentence against an evil work is not executed speedily, therefore the heart of the sons of men is fully set in them to do evil." But it will come.

And the so-called Progressives have learned nothing. The victims of this ostracism hold no more promise for the country than do the ostracisers.

For this reason the country will not be greatly concerned with the internal political fight, though that fight will have its inevitable effect on the tissue of the organizations themselves.

The country has moved off the political wave length. It finds its leadership elsewhere. The most that is now asked or hoped of politics is that it will not prove itself a hindrance to the people's proper work.

When politics returns again to be the public conference of the people's interests, not in government only, but in those basic things on which government is based, the era of statesmen will again be seen in the land.

# Tragedy of the Gold Rushes

## "Bonanza" Discoveries Which Brought Ruin on Their Trail

By J. V. NASH

ILLUSTRATED BY HARLAN JOHNSON

Placer mining with pick and pan.

SURELY there is no chapter in the history of the nineteenth century that makes more painful reading than the story of the four great "bonanza" discoveries which took place in that century—that of 1848-9 to California, that of 1851-2 to Australia, that of the early seventies to South Africa, and that of 1896-7 to the bleak wilderness of the Klondike.

In each instance the story, with slight variations, is the same—thousands of adventurers, including many criminals, and other thousands of poor "white collar" folk totally unacquainted with life in the wilds, joining in a mad rush to the gold fields in a barbarous and almost unexplored wilderness; many dying from hardship and exposure on the way, and, after arrival, the vast majority failing to find the gold they had expected and succumbing to disease, or returning empty-handed.

A few did "clean up" millions, but in most cases those who did were the least deserving of all—reckless, illiterate soldiers of fortune who didn't know how to use their newly acquired wealth wisely and in a short time dissipated it. Furthermore, the flooding of the market with immense new quantities of gold brought about a tremendous inflation of prices.

At the time of the first of the great gold rushes of the nineteenth century, the historic stampede to California in 1848-9, that state was a largely unexplored and uninhabited wilderness. W. F. Gordy, in his *History of the United States*, says:

"The difficulties and dangers on the plains and in the desert regions were many. There was danger not only from Indians, who often attacked the emigrants, but also from disease, occasioned by hardship and exposure. . . . . Bones of human beings, horses, and oxen lay strewn along the route . . . Among the gold diggers were disorderly and lawless men, who took advantage of the almost chaotic conditions. Angry disputes arose over mining claims; ruffians united to form bands of robbers; murders were frequent; and when disturbers of the peace were imprisoned, there was constant fear that a mob might release them."

Another authority describes the demoralization which followed the discovery of gold as follows:

"For three months there was little excitement, then a wild rush. Settlements were completely deserted; homes, farms, and stores abandoned. Ships deserted by their sailors crowded the bay at San Francisco—there were 500 of them in July, 1850; soldiers deserted wholesale, churches were emptied; town councils ceased to sit; merchants, clerks, lawyers and judges and criminals—everybody, flocked to the foothills.

"There was, of course, no home life in early California. In 1850 the women numbered 8 per cent of the population, but only 2 per cent in the mining counties. The miners were an energetic, covetous, wandering, abnormally excitable body of men. Occasionally a kind of frenzy would seem to seize on them, and, lured by the hope of new deposits of unheard-of richness, thousands would flock, on unfounded rumors, to new and perhaps distant localities.

"Such were the Kern River fever of 1855, and the greater Fraser River rush of 1858, the latter, which took perhaps 20,000 men out of the state, causing a terrible amount of suffering. Many interior towns lost half their population, and some virtually all their population as a result of this emigration; and it precipitated a real estate crash in San Francisco that threatened tem-

porary ruin. . . . Through varied instruments—lynch law, popular courts, vigilance committees—order was, however, enforced; better as times went on, until there was a stable condition of things. In the economic life and social character of California today the legacies of 1848-9 are plain."

Hardly had the worst phases of the rush to California begun to pass away, when wild rumors arrived of rich gold fields, in the remote wilderness of Australia. Immediately a stampede began, mainly from the British Isles.

The following testimony to the conditions which prevailed in Australia during the gold fever is that of contemporary witnesses.

By C. Rudston Read, published in 1853:

"The nearer we approached the metropolis (Sydney) did the scenes of recklessness and debauchery increase. At almost every public house between Paramatta and Sydney were fights and brawls of all descriptions.

"People who have never known what it is to have a hundred shillings, when they become possessed of thousands in such an extraordinarily sudden manner, cannot help telling everyone on the road of it, particularly if they meet at a coffee shop; or, instead of sending it down by the escort, convey it about their own person; when they very frequently get 'stuck up,' and if not killed, are disfigured for life, or perhaps left to die, unless some passing Samaritan lets them loose.

"A volume might almost be written on the ridiculous manner in which this class of people squander away their money; many, I have heard boasting at the diggings, as to the shortness of time in which they could 'knock down' a thousand or two pounds ($5,000 to $10,000) and return to the diggings, without sufficient to buy a pick-axe."

Here are some extracts from letters written by gold-seeking emigrants to relatives at home, quoted by John Sherer:

"The salaries in Melbourne have lowered one hundred pounds per annum, owing to the failure of nine-tenths of the diggings. It is awful. Nearly all the people have taken their passage back to England.

"You will scarcely believe it when I tell you that no less than seven ships from England have arrived here since Sunday last, none bringing less than 200 and 300 passengers each. . . . These people have nothing to do. The town is so full, that they are giving only half the wages they were a month ago. You may see quite gentlemanly men hawking wood and water about for sale, and working upon the roads. Out of the 200 who came out in the 'Blackfriar' and went to the diggings, nearly all have returned, and those remaining are earning only enough to subsist upon.

"Provisions are horribly dear. . . . Crime is very prevalent—in fact, the colony is getting bad altogether; and should the diggings fail, I do not know what will be the consequence. The convicts shoot you in a moment if you attempt to take them. In fact, it will be a complete California in a few months, if the diggings keep failing as they have for the last two months. . . . We have to sleep of a night with veils tied around our heads, to keep the mosquitoes and flies from us.'

Another:

"The gold fever appears to be raging all over Scotland and England at a fearful rate, so much so that I fear this country will be the scene of much misery and disappointment ere long . . . Gold digging is a lottery; for one successful man there will be a hundred who get nothing. You read in the papers of the lucky ones; no mention is made of the unfortunates; but if you were here, you would see plenty of them. The lucky gold diggers cannot spend their money fast enough. Of course, the first step is to get married. The bride is decked out in the most expensive manner possible. They only purchase the highest-priced articles, and spurn the idea of taking back change. They will drive out to Botany Bay, come home all drunk, and wind up with a jolly good fight. The class of men who have generally been lucky are of the lower orders, such as laborers, draymen, bullock drivers, and so on; and you can easily fancy what happens to men coming into town with a few hundred pounds in their pockets,

Victims of the gold fever en route for the diggings.

who never before had as many shillings. They go through it all in a few weeks, and go off again. Clerks and young gentlemen, generally speaking, are the most unfortunate."

We come next to the discovery of gold in South Africa, some twenty years later.

John H. Harris, writing in the *Atlantic Monthly* for April, 1923, on conditions in Africa, makes the following terrific indictment of gold:

"Gold, scarlet woman of the modern financial world, has ruined more men, while at the same time it has made more fortunes for a few individuals, than any other African commodity. The love of gold has been the root of almost every evil thing in Africa; seeking the lands wherein gold was secreted has caused the shedding of rivers of blood; while the gaunt specters of white men in the phthisis hospitals of Johannesburg tell today their own horrible story of the price those must pay who pit, blast, and mine, a mile below the earth's surface, for the precious yellow ore."

From 1836 to 1840, the Boers "trekked" far across the veldt to the wilderness beyond the Vaal River, where they established the two little republics known as the Transvaal and the Orange Free State.

A treaty was signed with the British Government, whereby the independence of the Boers was guaranteed.

Things went well until, alas, in the seventies gold was discovered in the Transvaal. The horde of adventurers which soon began to invade the country naturally came into conflict with the frugal and simple Boer farmers. For the next several years there was constant trouble. The bulk of the new settlers being of British extraction, their government was repeatedly appealed to by them for the protection of their "interests."

Space precludes any attempt to discuss here the rights and wrongs of this long controversy. In a few years the country was definitely annexed by England, but in the War of 1880 the Boers were victorious, and the British Government agreed again to respect their independence. Then followed another fifteen years of smoldering conflict, culminating with the "Jameson Raid" in 1895 and the breaking out of the final Boer War, which dragged on from 1899 to 1902.

Notwithstanding the fact that the odds were heavily against the Boers, they were formidable antagonists, every man being a trained sharpshooter and accustomed to the methods of guerrilla warfare. The losses inflicted upon the British were enormous. The result was the final destruction of the only white republics of the great continent of Africa.

***Johannesburg Was the Center of Activity***

Gold mining in the Transvaal involved difficulties greater than in any of the other famous gold fields. The surface deposits were quickly exhausted, but immense "reefs" of extremely hard rock, penetrating the earth to an indefinite distance, were found to be rich in the yellow metal. To extract it, however, necessitated the introduction of costly machinery, and this in turn required capital. European capitalists and exploiters, therefore, have reaped most of the profits from the South African gold fields.

"The larger mines on the Rand," says Meade, "have spent from $2,000,000 to $3,000,000 in exploration and development, and in equipment, before extracting a single ounce of gold." Mining operations are in many instances carried on a mile below the surface of the earth, in a temperature of almost stifling torridity.

Lord Bryce, who visited South Africa just before the outbreak of the final Boer War, gives an interesting picture of the gold region about Johannesburg:

"There is nothing in the natural aspect of the mining belt to distinguish it from the rest of the Transvaal plateau. It is a high, dry, bare, scorched and windy country, and Johannesburg, its center, stands in one of the highest, driest, and windiest spots, on the south slope of the Witwatersrand ridge, whose top rises some 150 feet above the business quarters. . . .

After an illuminating description of the methods of extracting the ore, he goes on to say:

"Hence, in the South African gold fields, the men who do the actual work of mining are not independent adventurers, but mere laborers, working in the bowels of the earth at a killing heat for miserable wages. . . ."

Meanwhile, in the late nineties, occurred the last of the great gold rushes of the century, this time to the frozen wilderness known as the Klondike.

"Rumors of these rich deposits," says Gordy, "drew thousands of gold seekers to the coveted land. They journeyed with all possible haste, undaunted either by rugged mountains, swift rivers, or the rigorous climate. Many died of hardships before reaching the land of their hopes, and many more were obliged to draw back. Only a few of those who reached the mines got the gold of which they had dreamed."

***Grim Horrors of the Klondike Rush***

J. H. Curle, a contemporary writer, relates:

"The Klondike, sooner or later, was to disillusion most of those who went there. . . . The gold lay mostly on the bedrock, under perhaps six feet of (frozen) gravel. . . . A reasonably good meal at Dawson cost a dollar. An evening in a dancing saloon, with suitable liquid refreshment for self and partner, ran into big money."

Speaking of miners who made a "clean-up," Jeremiah Lynch says:

"They had led a desultory, wandering existence in the North and Northwest for years, and when the Klondike granted them sudden and abounding wealth, it was a Fortunatus' purse. They were amazed if not abashed. So, from riding on horseback into Dawson saloons, smashing the mirrors and glasses and furniture, and paying thousands of dollars damages therefor without a murmur, to marrying ladies of questionable type and career, it was only a natural step."

Most vivid and realistic is Hamlin Garland's description of the terrible mountain trail over the Chilkoot Pass, main entrance into the Klondike:

"Upon reaching the end of the wagon road, and entering upon the trail, we came upon the *way of death.* The waters reeked with carrion, and all Nature was indecent and disgusting by the presence of carcasses. Within the distance of fifteen miles we passed more than 2,000 dead horses. It was a cruel land, a land filled with the record of men's merciless greed. . . .

"We got away at last, leaving behind us that sad little meadow and its gruesome lakes, and began the slow and toilsome descent over slippery ledges of rock, among endless rows of rotting carcasses, over poisonous streams

"Psychoanalysis reads into the human mind something that is in the mind of the analyst," writes Doctor Collins. "There may be people in Austria who 'unconscious' are the cesspools that Freud describes, but I have not encountered such people in these United States."

A reproduction from a picture painted in 1849 by C. Nahl, entitled "A Holiday in the Mines."

and through desolate, fire-smoked, and ghastly forests of small pines. Everywhere were the traces of the furious flood of humankind that had broken over this height in the early spring. Wreckage of sleds, abandoned tackle, heaps of camp refuse, clothing, and, most eloquent of all, the pathway itself, worn into the pitiless iron ledges, made it possible for me to realize something of the scene.

"Down there in the gully, on the sullen drift of snow, the winter trail could still be seen like an inclined ribbon, and here, where the shriveled hides of horses lay thick, wound the summer pathway. Up yonder summit, lock-stepped like a file of convicts, with tongues protruding and breath roaring from their distended throats, thousands of men had climbed with killing burdens on their backs, mad to reach the great inland river and the gold belt . . . In all this could be read the merciless greed and impracticability of these gold seekers. Men who had never driven a horse in their lives, and had no idea what an animal could do, or what he required to eat, loaded their outfits upon some poor patient beast and drove him without feed until, weakened and insecure of foot, he slipped and fell on some of these cruel ledges of flinty rock. . . . Some of them had even been tied to trees and left to starve."

In his little epic entitled "The Gold Seekers," Mr. Garland presents in verse a pathetic picture of the tragedy of the Klondike. One or two stanzas follow:

"They go to a toil that is sure,
To despair and hunger and cold;
Their sickness no warning can cure,
They are mad with a longing for gold.

* * *

"Some will sink by the way and be laid
In the frost of the desolate earth;
And some will return to a maid,
Empty of hand as at birth."

Will there be other great bonanza discoveries in the future? From time to time rumors appear in the newspapers of important gold deposits in different parts of the globe, but they have proved largely deceptive; at any rate, there have been no stampedes to the new fields at all comparable to the four historic gold rushes of the past century which we have been reviewing.

"I have no way of judging of the future but by the past," sagely observed the great Patrick Henry; and, judging by the past, the discovery of a new El Dorado would be an unmitigated calamity for humanity. Take the case, for instance, of the little republic of Liberia, which for one hundred years has succeeded in maintaining its independence, and is today the only republic and the only independent Negro country in the whole immense continent of Africa.

A recent writer, in a book published after a visit to that interesting little commonwealth, declares that the worst misfortune which could possibly befall it would be the discovery of important gold deposits within its borders; the country would quickly be demoralized and debauched, it would become a bone of political contention, its independence would forthwith be extinguished and the country formally "annexed" by one or another of the great powers.

## Canberra—Australia's National Capital

MIDWAY between its two big cities, Sydney and Melbourne, and off the present main line of travel between them, the Commonwealth of Australia is building a city that, when completed, will become the national capital. When the time comes for it to appear on the maps, students of geography will answer the question as to what city is the capital of Australia by responding, "Canberra."

The Australian states and the Island of Tasmania federated themselves into the Commonwealth of Australia only twenty-five years ago. At the very outset there was keen rivalry for the honor of being the capital city of the new federal government, several cities inviting consideration. The choice soon lay between the two powerful cities of Sydney and Melbourne and there it became deadlocked, with each city insisting on its special merits and unanswerable arguments as to why it deserved to win.

The deadlock was ended by a compromise agreement that each city was to be the capital for alternating periods of three years. Sydney got the first turn and for three years it was the capital of Australia as well as of New South Wales. Then all the federal offices were moved to Melbourne and it became the capital of Australia as well as of Victoria. At the end of three years the federal business had grown considerably and there were objections to moving. So the original argument started anew.

Compromise again was needed. This time the decision was reached to give the federal government a permanent home in a brand new town, and a point about equidistant from each of the two big cities was decided on. Sydney was mollified somewhat by the fact that this site is in its own state, New South Wales. Melbourne was mollified somewhat by the fact that the federal government stays there until Canberra is built, and the job probably will take a number of years more. The new capital is about 300 miles distant from both Sydney and from Melbourne. Railroad connection to it from each will have to be provided when it is completed and ready for occupancy.

# Literary Memories: Writers and Publishers of Yesterday

## They Were a Lively Inventive Lot, With Good Taste

By THOMAS L. MASSON

ILLUSTRATED BY W. O. FITZGERALD

IF DENIS DE SALLO and Sieur de la Condraye, who are credited with starting the first magazine in 1664 (*Journal des Savants*), could stand before an American news stand of today, they would probably drop dead with shame to think to what stage they had brought the world.

Yet the other side—and by this I mean the decent side—is the one that wins in the long run. For in spite of the *luridity* displayed on our news stands, it is consoling to know that in periodical, as well as all other forms of literature, decency earns the largest profits.

Not long ago a friend of mine, whose business is located in one of our largest cities, with a population of 450,000, in passing to and from his office, was appalled to see so many suggestive periodicals displayed on the news stands openly. He appealed to the Post Office and then to the news companies, to discover that neither of these agencies was the medium for distribution—that the deliveries were made by truck. He then appealed to the Chief of Police, and he was backed up by the best business men in the city. The result was that within a few days, the sale of twenty-six of these "sex" periodicals was suppressed. This method has seemed to be the most practical way of solving this problem.

In this country nearly 4,000 monthly periodicals have a combined circulation of about one hundred million copies a month, running more than a billion a year, and this does not include the weeklies. The era of cheap magazines began in 1889 with *Munsey's*. This was reinforced by the ten-cent *Cosmopolitan*, projected by John Brisben Walker, and *McClure's*, by S. S. McClure (1893), who has recently come back to his first love which—under some management or other—has during all these years contrived to keep afloat. Mr. McClure was the first editor in this country to see the syndicate possibilities, and practically inaugurated and started the syndicate idea, "McClure's Syndicate" still running under his name. This syndicate was started in 1884.

Somewhat later than this (as I recall it, in 1894) Irving Bacheller secured the first syndicate rights to use Rudyard Kipling's writings. Bacheller and myself and Richard Watson Gilder, then editor of *The Century*, had formed a club, with quarters in the then oldest building in New York (on Monkey Hill, just underneath the Brooklyn Bridge). In this club were some of the most brilliant minds of the time. Among them was Stephen Crane, undoubtedly the originator of the realistic short story of today. Crane was delicate, was mostly silent, but we all, I think, recognized his genius. After his *Black Riders* came out and was praised by W. D. Howells, and a little later when his *Red Badge of Courage* achieved such success, he said to me one day, quite suddenly, out of a long silence: "I know now how Byron felt, when he awoke one day to discover himself famous." Last year Thomas Beer, whom I must regard as one of our very best short story writers, published a biography of Crane over which he labored four years, and which is a work of high literary merit. It was during some of the sessions of this club, which we named "The Lanthorn Club" that so many "modern" ideas were sprung. I remember quite vividly one evening Irving Bacheller read from the manuscript of a poem he had just received from Rudyard Kipling, the title of which was *The Liner She's a Lady*, the first two lines of which were

"The Liner she's a lady, an' she never looks nor 'eeds—
The Man-o-War's 'er 'usband, an 'e gives 'er all she needs;—"

Irving Bacheller had a slow drawling voice—one might say indeed it was a voice with a deep tonal background (he still has it, by the way)—and he read this poem of Kipling's with great feeling. Yet it must be confessed that we did not rise to it. None of us caught its true genius. It was at this time that I sent Mr. McClure, for his magazine, the manuscript of a short story about a baby who could talk from birth. He returned it to me with a note mildly depreciating it. After its later publication in another magazine, he wrote me to the effect that when I had anything so good as that to be sure to send it to him first. I returned his original note of declination, and he wrote back then and said that it wasn't his fault; he had been requested to read the story too quickly. He has, I think, contributed more lively edi-

"Denis de Sallo and Sieur de la Condraye, who are credited with starting the first magazine in 1664, would probably drop dead with shame to think what they had brought about."

torial ideas than it has been given to any other editor in at least one generation.

John Brisben Walker was also one of the most brilliant and creative publishing geniuses in this country but he was unfortunately not well balanced, and he had difficulty in getting on with his employes. At one time, indeed, it was proposed to form a club consisting of all the editors he had discharged. Some of these men afterward became quite prominent; I don't think any one of them was a failure. He had an unerring faculty in picking them, but afterward he couldn't retain them. He once wired me that he must see me at once on a most important matter, and at considerable inconvenience I got on a train and journeyed to his house on the Hudson near Tarrytown. I arrived late in the afternoon, took a conveyance to the house and was told to wait. Somewhat later I was ushered upstairs into his bedroom. He was sitting up, looking like an *edition de luxe* invalid. Immediately he offered me the editorship of the *Cosmopolitan* at three thousand dollars a year, which, even in those days, was not so large. I explained to him politely that I was already receiving three times as much, and, in some excitement, he got back at me immediately by shouting: "But consider the glory!" I had a hard time getting away from him, but I always admired him greatly. As I recall it, he projected and organized the first automobile race in this country, from Lower Broadway to Tarrytown, amid enormous enthusiasm. He was greatly enamored with Langley, the flying machine man, and always insisted that he was one of our greatest inventive geniuses. He once entertained me with a long and impassioned harangue on Russia (this was in 1895) and while the details are vague, I believe that most of his predictions have since come true.

On one occasion he came on from the West, apparently for the sole purpose of telling me that "No editor could be radical enough." He said the people expected it. "Don't be timid," he asserted vigorously. "No matter how radical you are, it won't be radical enough." Since then some of the most radical ideas have been and are appearing in the most outwardly conservative papers, which recalls a remark I once heard H. C. Bunner make. He was the brilliant editor of *Puck* at the time I began as literary editor of *Life*. He said: "If I refer in *Puck* to Jehovah, I call down the wrath of my people, but *you* can publish anything you want about Him and it doesn't matter."

This radical idea of John Brisben Walker stuck in my mind for some time, finally—with the approval of the chief editor and owner, Mr. Mitchell—resulting in our issuing the Improper Number of *Life*. Our intentions were quite normal and proper, however, as this celebrated number was simply a satire on indecency, and immediately recognized as such by the most intelligent of our readers, who uttered screams of delight. The circulation, which up to that time had been less than 100,000, rose for this number to 243,000. It excited the intense indignation of many conservatives, among them being Dr. Rainsford of St. Georges Church in New York, who wrote canceling his subscription. We returned a check for the remaining balance, and two weeks later discovered that a member of his family, noticing the paper had stopped, had renewed the subscription through an agency. The good doctor must have calmed down, as no more protests arrived.

"I can well remember the time when the editor was a kind of remote and sacred personage."

*Puck* was one of Mr. Hearst's failures. After Bunner died it was edited by Harry Leon Wilson and "Pop" Gibson, and later by John Kendrick Bangs, who was paid $200 a week to edit the paper and supply a large portion of the text; which, by the way, is never a good arrangement to make with any editor as it tends to repel outside contributors.

After *Puck* had run its course under Bangs, it passed into the hands of one of the Strauses, who bought it for his son. After expending upon it a sum variously estimated at from $200,000 to $300,000, it was sold to Mr. Hearst, in whose sheltering arms it passed out peacefully some years ago. He has quite recently purchased *Town and Country*, a very respectable monthly with a hitherto varied career, and he now owns six periodicals with combined circulations of more than three and one-half millions. Hearst is a man of extraordinary abilities, and I have always pictured him as a kind of typographical Machiavelli. It seems quite probable that his moral sensibilities, like the renowned Topsy, have never had a chance to grow up.

In spite of the present flood of sex periodicals, some of which have enormous circulations but which I believe will steadily decline in their popularity, the magazine industry as a whole (one of the largest industries in America) has been steadily improving for a number of years. This is due to various influences, the main one being that the large amount of capital now required to run successful magazines has made necessary a scientific study of methods. And this has led to the employment of only men of first-class ability as editors. Indeed, it is now high time that someone said a good word for editors who (aside from a few black sheep) are on the whole as able a body of men as we have in America.

I can well remember the time when the editor was a kind of remote and sacred personage, and the term *sanctum sanctorum* had some real meaning. He was either that or he was a pompous autocrat, whose sole judgment governed the conduct and methods of his paper. There is a historic episode, clinging to the traditions of the *Century Magazine* when Richard Watson Gilder (a most lovable person) was the editor—of how Robert Louis Stevenson had to wait in the outer office like a stranger (as indeed he was) and, as I remember, finally went away without seeing anybody of importance. Theodore Dreiser in his *Myself* complains of similar treatment in newspaper offices which, I regret to say, is still too common today. That sort of thing, quite naturally, might happen at any time; but today when it does happen in magazine offices it is the exception, and due to the great pressure brought to bear on all editorial staffs, and not to any ignorance of the im-

portance of all visitors. Cranks and bores will probably always exist, but even for these generally misguided people there is much more sympathy, for out of them either come occasionally big ideas, or they lead to big ideas. Every important periodical now has one or more and in some cases several men whose main business it is to get acquainted personally with all old and new contributors and, so to speak, to beat up the literary woods for further new ones. In short, justice to everyone is now the rule, always admitting exceptions. I remember quite vividly certain occasions when James Gordon Bennett, the second, owner and editor of the New York *Herald*, arrived from Paris on one of his sudden visits. The story is told that no matter where he was, his inkwell had to be freshly filled. One day he came and the ink was low; discharges followed. Men with families on their hands were discharged overnight or their positions curtailed merely for some whim. Bennett is now merely a symbol of a past era. Although one man may still be the boss, that man himself is guided and controlled by the spirit of coöperation.

But all progress is accompanied with backwash. Anyone nowadays who has something of importance to say, no matter how radical, can get it into print, if it is well enough done. The proof of this lies in the periodicals themselves. Along with much that is undeniably trivial, there has never been a time when there has been such good writing, so accurately administered by the highest intelligences. A perusal of the contents of single issues of periodicals like *The Atlantic Monthly, Harpers, Scribners, The Century, The Woman's Home Companion, Ladies' Home Journal, Pictorial Review, American*, and such weeklies as *The Saturday Evening Post, Liberty, Nation, Collier's*, et cetera, must impress anyone with the astonishing merit of the goods displayed. So accustomed are we in this country to depreciate ourselves and to admit so self-consciously the charge of commercialism, that we overlook one of the most overwhelming facts, namely: that the present era, through its periodical literature, is practically presenting an instantaneous view of life in all its aspects, unapproached in expression and artistic merit in any age in the history of the world.

In my opinion, there is no reason why we should so complacently and in many cases so servilely accept the patronizing criticisms of overripe European critics, most of which rise from a combination of envy and lack of understanding.

So far as our periodicals are concerned, we publish by far the most artistic and best-written magazines in the world. Anyone who doubts this, and who is also troubled with insomnia, should read some of the English reviews!

***I read in the papers*** that the old Parker House in Boston which gave its name to the famous breakfast table roll is now a thing of the past. That leaves only Young's to purvey the old flavor. We trust Young's will be allowed to remain. Built in 1854 the Parker House made hotel history not only through the creation of the delicious roll by Sanizan the chef who was paid $5,000 per year when that was a fabulous salary, but also by the establishment of the first hotel library. It was the home of the Saturday Club, the institution of Boston's great literary lights of sixty years ago, and the pompous Ancient and Honorable Artillery Company also made its headquarters at Parker's. The room in which Dickens slept and the hall in which Grant and his entire cabinet dined and the parlor in which Patti received her friends were indicated to Boston sight-seers. But the Parker House was built for gentlemen who were more accustomed to ask for a bootjack than for trouser pressing service and a modern and entirely unromantic hotel will take its place.

*The International Jew* in 4 volumes: *The International Jew*, Vol. I, 235 pages; *Jewish Activities in the United States*, Vol. II, 256 pages; *Jewish Influence on American Life*, Vol. III, 256 pages; *Aspects of Jewish Power in the United States*, Vol. IV, 246 pages. Price: 25 cents each; set, $1. The Dearborn Publishing Company, Dearborn, Michigan.

***I read in the papers*** that smoking is to be permitted at Byrn Mawr, in accordance with a change in the resolution forbidding smoking which has stood since 1897. This change was effected by a vote of the self-government board of the college, a majority of the members of which do not smoke and do not care to smoke. This is taken as a straw that indicates the direction of the wind of public opinion.

***I read in the papers*** that all transcontinental railroad time records have been smashed by a so-called oil-electric propelled coach of the Canadian National whose time for the 2,937 miles between Atlantic tidewater at Montreal and the Pacific Ocean at Vancouver was less than 67 hours, an average speed of 43½ miles per hour. The fuel consumption was one gallon for every three miles. This performance together with the reports upon oil-electric locomotives that are being tried out would indicate that the steam locomotive like the steam marine engine is destined to be replaced by internal combustion engines wherever electric traction is not available.

***I read in the papers*** that thirty-five million tooth brushes are consumed in America every year. Making the liberal allowance of six months' life for each of these brushes it would appear that only about eighteen million Americans take that care of their teeth which the use of the brush implies. There would still remain about seventy-five million citizens who have more or less teeth and, on the most favorable figuring, it would seem that only one-fourth of them use a brush at all. Yet our best known American surgeon declares that the next step in the prevention of disease must come through better care of the mouth which with its moisture, warmth and loose tissue as well as immediate communication with the interior of the body is an ideal breeding place of germ life. Notwithstanding the need for improvement, America far and away leads all other so-called civilized countries in care of the teeth. The term "American dentist" stands for the best everywhere and foreign kings take care to have a graduate of American dental colleges in personal attendance upon the Lord's annointed although their subjects may go hang so far as dentistry is concerned.

***I read in the papers*** that Darrow and James Schermerhorn had a debate on Prohibition. It was a remarkable exhibition of Mr. Darrow's facile inconsistency. What he says with all his unction of grimace on one occasion, can be neatly reversed to fit conditions in the next condition. He quotes Scripture, while refusing to believe it, and practices law which in part he despises. Mr. Darrow, if signs mean anything, is pretty nearly punctured in this country. An able man, yes! Ability is the commonest thing in this country. Ability is becoming as common as honesty. An able man, but to what uses does he put his ability?

***I read in the papers*** that *Desire Under the Elms* had a short and unsatisfactory run in Detroit. It is explained by the Detroit *News* that there were not enough morons and degenerates in the city to support such a play. I did not see it, but even the "wise ones" whom I know and who saw it were one in their opinion that it was nastiness without cleverness, pornography without point. With no artistic necessity behind the writing of a play, no power can be expressed through it; that much is certain.

# Jefferson Davis Brought Camels to the U. S.

## Camels Made Fine Substitutes for Horses and Mules in Government Service

SEVENTY years ago Jefferson Davis, then Secretary of War in the Cabinet of a Yankee President, Franklin Pierce, introduced seventy-five camels into the Southwest to demonstrate their adaptability to army transport in arid and mountainous regions.

The actual use of these camels quickly justified Davis in having undertaken the experiment. A Texas rancher promptly imported two shiploads of camels and a Nevada mining company also imported a number of them to pack supplies two hundred miles.

Camel secured for protection against a gale.

The camel idea was thrust upon Davis while he was a colonel in the Mexican War under General Zachary Taylor. During the campaign across the Mexican mountains and deserts, Davis was convinced that a trial of camels as a substitute for horses and mules for such grilling service should be made by the government.

Davis, after the Mexican War, became subsequently Secretary of War. He sought to get the War Department and Congress to give camels a trial.

In his annual report for 1853, Davis pictured the terrific military and civil transportation problems presented by the lack of either roads or navigable streams in the vast Southwestern and Pacific regions.

Indefatigable on behalf of the pet scheme of his friend Davis, Senator Shields finally wrested $30,000 for camels from Congress on March 3, 1855.

The naval storeship *Supply* was commissioned to carry these camels upon the long voyage.

Before sailing from New York, there was built a special camel cabin upon the spar deck of the ship. This furnished light and ventilation not found down between decks. There was devised a harness and roping arrangement, supplemented by rope fenders covered with gutta-percha air bags in front of the camels and bales of hay packed behind them. When the ship rolled the camels knelt and were prevented from kicking and injuring themselves as horses and mules do at sea. Porter declared to Jefferson Davis that: "The ship may be thrown upon her beam ends without a camel moving."

A special loading jig for the camels consisted of a scow that could be either run upon the beach or against a quay, and a camel car or car was fitted into the scow. The camels were first harnessed and then a block and tackle persuaded the animals to enter the car that was closed and floated to the ship side and hoisted on board.

Lieutenant David Porter, Commander of the *Supply*, visited a herd of 250 camels upon the estate of the Grand Duke of Tuscany near Pisa. These camels, whose ancestors were brought from Egypt two hundred years before, were performing the work of four times as many horses.

Porter and Major Henry Wayne scoured the Levant as eagerly for camels as Jason once sought the Golden Fleece in those parts. Tunis, Salonica, Constantinople, the Crimea, Alexandria and Smyrna were visited. Camel buying is said to be a more difficult art than horse trading, but these Yankees returned with good stock. Their reports were full of racy stories about matching wits with beys, sultans, pashas and their grafting officials.

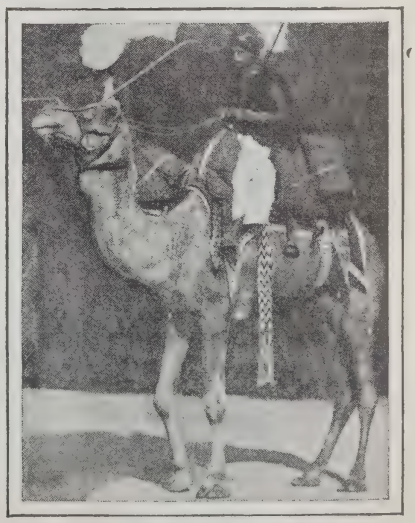
The *Supply* sailed from Smyrna on February 15, 1856, with twelve male and twenty female camels and one calf.

The *Supply* put into Jamaica for six sweltering days. The camels were a local sensation, four thousand visitors inspecting the cargo in one day, much to the disgust of the camels, Lieutenant Porter reported. One adult camel died en route and two of six calves born on board lived.

The thirty-four surviving camels were landed at Indianola, now Port Lavaca, Texas, in 1856.

Major Wayne sent a camel to a forage barn at Indianola to carry four bales of hay, weighing 1,256 pounds. A Texas poet depicted the incredulity of skeptical natives when the kneeling beast of burden arose and calmly walked off with its heavy load.

The caravan passed through Victoria, Texas, on June 12. Major Wayne was having the camels stripped of their surplus hair in order that they might better withstand the heat and dust.



The camels were established in permanent quarters at Camp Verde, sixty miles northwest of San Antonio.

Six camels, accompanied by two six-mule wagons, were sent into San Antonio to carry back oats. The camels returned immediately to Camp Verde in 54 hours with 3,648 pounds of grain. The teams had to rest a day longer in San Antonio and returned in 96½ hours with 3,700 pounds upon both wagons. The camels stalked straight across the mountains, but the wagons had to follow the longer so-called roads. Twelve camels were once in San Antonio when continuous, torrential rains began to descend. The camels were each loaded with 325 pounds and returned to Camp Verde in 54 hours although wagons could not move through the bottomless mud.

Lieutenants Porter and Heaps were sent out in 1856 to get a second lot of camels. In Smyrna, they purchased forty-four, three of which died en route The average cost of the first lot was $300

Bactrian camel, with two humps.

Dromedary, with one hump.

and that of the larger second lot was about $250.

Lieutenant Edward F. Beale employed twenty camels to carry supplies while he was making a wagon road from New Mexico to California in 1857.

During the next four years Beale continued to use these camels upon exploring trips in remote parts of the Southwest. As Surveyor General of California, in 1861, he asked the War Department to permit him to retain his camels, but the bureaucrats declined.

Lieutenant Edward L. Hartz, quartermaster for a military survey party, used twenty-four camels to carry supplies upon a several months' reconnaissance in midsummer, 1859. The party crossed the Pecos River into West Texas, and went to Fort Stockton and Fort Davis and then penetrated the wild Big Bend to the Rio Grande opposite the Mexican Presidio San Vicente.

Hartz said that "The camels encountered hills and mountains of the most difficult nature; crossed streams, traversed prairies, some smooth, others rocky and broken by a rapid succession of deep arroyos or ravines.

On one day no less than fifty-seven arroyos, some fifty to seventy-five feet deep with smooth banks sometimes as steep as 45 degrees, were crossed.

Had the War Department persisted in the use of the camels after the Civil War, the public might have been converted. Anything associated with Jefferson Davis, however, was both anathema and political capital to those politicians that flourished for generations by waving the bloody shirt.

# The President and Mr. Coolidge

(*Concluded from page 4*)

secretive would with him take on the aspects of garrulity. *Mr. Coolidge* can and does talk. *The President* is silent even with him.

Take the case of Secretary of War Weeks and his successor, Mr. Davis. Everybody knew that Mr. Weeks was resolved to resign. Positively! After the very date the impending resignation was to bear became fairly public property, the President still expressed the hope that Mr. Weeks would remain. Mr. Coolidge doubtless knew the facts but he kept his knowledge of it a secret from his official self. He didn't let the President know a thing about what was doing.

Mr. Davis as Assistant Secretary had been performing, and performing well, all of the Secretary's duties while Mr. Weeks was ill. He had every reason to believe that he would be appointed, as he deserved to be appointed, to succeed his chief. But he didn't know it. All that he did know was that if he wasn't appointed, he would resign and go back to St. Louis. The first knowledge Secretary Davis had of the President's purpose came from the public and official announcement of his appointment to be Secretary of War. And still they call him "Silent Cal"! When compared with the *President's* habitual reticence, "Cal's" silence is loud noise.

Secretary Davis has "made good." When the demand for an inquiry into the whole problem of the nation's air force became acute, Davis met the situation not by receptively inviting, but by vigorously demanding such an inquiry. So much for the Secretary of War.

The Secretary of the Navy, on the remote and far distant other hand, gave out a statement that there was no need for an inquiry—no need whatever. So much for the Secretary of the Navy.

Whereupon the President promptly appointed a board of inquiry. It would seem that would cause Judge Wilbur to *THINK*.

It will be remembered that it was found necessary during the presidential campaign to suppress a speech Mr. Wilbur proposed to deliver in Denver and to call him back to Washington forthwith to wear a muzzle. Nobody would ever have known anything about it had not the Secretary broadcast the fact that he had been summoned and had he not used extraordinary means to hasten his journey.

He sped across country calling out in effect to all and sundry, "I've been summoned to Washington by the President for an immediate conference. Ask no more. My lips are sealed." They were. He didn't then know why he had been recalled. Timid folk began to worry lest war menaced and to ask why, where, what and who? All this needlessly spectacular display of itself at last forced out the truth, that the California judge merely was being taken out to the White House woodshed for a little discipline.

Even the manner in which Judge Wilbur came to be appointed was unusual. The President was gravely perplexed in choosing a successor to Mr. Denby. The times were politically critical, the need of appointive prudence acute.

It became known that the President had been unable to fix upon a choice and would welcome suggestions. Whereupon Bob Armstrong, the Washington correspondent of the Los Angeles *Times*, handed in, with commendatory comment, the name of Mr. Wilbur, at that time a member of the California Supreme Court. Of course, Armstrong is not to be held solely responsible for the appointment or for its consequences.

The President made his inquiries, the responses appeared satisfactory, and the appointment followed.

No one knows what the President thinks of the individual members of the Cabinet. Except in the cases of Hoover and Mellon, they are left to guess whether the President thinks they are hitting the bull's-eye or not. But, as to one or two of them, it is safe to say that if the cabinet-building President ever holds communion with whatever may be left of the cabinet-building ten-year-old boy of whom he is himself the growth, he says, in whatever may be the New England colloquial equivalent: "Bub, believe me, you certainly had one snap!"

# Something About Tattooing

TATTOOING is dying out among the Polynesian peoples, but dying slowly. The Polynesians comprise the native South Sea Islanders of Hawaii, Samoa, New Zealand, Cook Islands, Society Islands and the Marquesas. Few Hawaiians who are tattooed are seen any more. In New Zealand only the older Maoris are tattooed. In Samoa, to tattoo or not to tattoo is about the most burning domestic question of the day at the present time.

Occasionally a strong young man will die in agony from the torture of tattooing. Others suffer for months before they recover their health. This makes some young men inclined to shy away from it, especially as they know that the practice is being stopped in many places, but it probably will continue even if it has to be done secretly, until the young women put "thumbs down" on the whole thing.

For, be it known, a youth of 16 who is tattooed is a man. If he is 30 or 40 and not tattooed, he is still a boy. And the Samoan young woman prefers men to boys when it comes to suitors. She has her knees tattooed, from six inches above the kneecap to six inches below it. The men are tattooed from a fancy edging at the waistline, down to the knees. Their legs are tattooed so solidly that from a little distance they appear to be wearing purple tights.

The tattooing is done with sharks' teeth, edged like little saws, and the coloring is made from fruit and herb juices. The saw-like tooth is pressed through the skin, and so many times must this be done before the solid effect is obtained that it takes a year.

Samoans never tattooed their faces, as did the Maoris of New Zealand and the Marquesans. The latter two tattooed only their faces. Many Marquesans have faces that are covered solidly with weird stripes, circles and curves of various colors.

# Romantic Rascals

## Emma Lyon, 1761-1815

(Thirteenth of Series)

By CHARLES J. FINGER

WOOD BLOCKS CUT BY PAUL HONORE

(Copyright, 1925, by Charles J. Finger)

EMMA LYON, nursemaid, was tall and deep-chested, her eyes were blue, and she had a crown of soft dark hair that was like gold when the sun touched it. Until she was sixteen, she was quietly happy with her curly haired charges in the old garden with its wealth of shrubbery, its tall trees that carried yellow and crimson roses, its gossamered flower beds and shining lawn, and it was an adventure to come upon an unsuspected violet or an early snowdrop. But the family went to London, taking Emma, and soon she came to look upon the garden life as a time strangely dull and uneventful, indeed almost trivial and foolish. That was after she had seen Ranelagh, and Marleybone Gardens, and Vauxhall, where were fireworks and music and colored lamps. It was after she had known the thrill of streets and streets and streets, and the sight of ribboned ladies, and dandies who lounged in the park, and pastry-cook booths, and bustling tradesmen, and soldiers who had been in the American war; after she had found delight in the noises of horses and coaches and shouting hawkers, in the riverside with its boats with flags and pleasure parties and French horns. For she found London a place of high-hearted activity, and energy, and laughter, and movement, and exciting bustle. So she commenced to devour books of romance, and her mind became filled with dim pictures of greatness and wealth and honor.

One day, on adventure bent, while walking down Adelphi Terrace, she saw a tall man at the door of a house, and he was gay in sky-blue coat and silk stockings and buckled shoes. He was very grand in manner though somewhat wild of eye. Now that sense of rectitude which prevents young ladies from addressing unknown gentlemen did not burden the country nursemaid, so she spoke to the man somewhat chaffingly, saying, "La! What fine shoe-buckles have we got!" pointing to his shoes as she did so, and stopping in her walk to strike an attitude of mock admiration.

But the man made a large sweeping gesture as he took off his hat, and said, with vast solemnity: "Those cheeks! That skin! Those eyes! Do I then behold Vestina, the Goddess of Health?"

"Which Vestina ain't my name," answered Emma, and would probably have said more had not the man waved her into silence and then talked on so quickly that she was bound to listen.

It was a torrential outbreak of insufferable oratory delivered in oracular manner and much as if he addressed a public meeting, which in truth he did at the end, for passers-by were attracted and halted to hear, some in sheer idleness, some thinking the man harmlessly drunk, some holding him to be mad. But Emma was vastly interested first hearing the speech, though afterward it bored her intolerably, that is, when she had heard it many times, for it was the man's spoken advertisement and delivered on all occasions.

"But you are Vestina," he declared. "You are that creature I long have sought, and having found, light and beauty can henceforth reign triumphant. You behold in me no common man, but James Graham, a physician; nor does that physician stand at the door of a house, but rather at the Portal of the Temple of Health. So hear me one and all."

He paused a moment then and took snuff, for his crowd had commenced to gather and it was a time for his set and prepared speech.

"If there be one human being," he went on, "rich or poor, male or female, in this great metropolis of the world who has not seen this enchanting Elysian palace with its supremely brilliant and unique decorations, this Temple where wit and mirth, love and beauty, and all that can delight the soul, and all that can ravish the senses—if there be such a one, I say, let him or her blame himself and now stand forth, or forever afterward bewail his irremediable misfortune."

All of that he said with great speed, then, having run out of talk, he fell to tapping his snuffbox, looking not at Emma or the gathered crowd, but beyond, as one who saw visions.

"My name ain't Vestina, but it's Emma," said the nursemaid. "Nor I don't know nothing about what you're saying with your palaces and temples." She would have passed on, but the man came down the steps at a little run, touched her on the shoulder, bowed with great politeness, and looked so strange and, she thought, so wise, that she stood awhile.

"Vestina, Goddess of Health, hear me!" he exclaimed ecstatically. "Long have I sought you, the Blazing Star! You are no vulgar Emma as you think, but Hygeia herself, and I will make your fortune. Your kingdom awaits your presence. You shall be the Vestal of the New Jerusalem church. Enter then, I pray you, into the Temple."

He bowed again and again while saying that, then being finished, ran up the steps and beat loudly on the door with his gold-headed cane. The door was flung open and there came from within two tall men in splendid liveries and great cocked hats, who, at a sign from the man, made of themselves an escort, for him and for Emma, bowing very obsequiously.

"So we are a princess at last, are we," said the nursemaid, and gave a dashing representation of the grand lady, based on a character in some sentimental romance she had in mind, then skipped up the steps and passed into the house.

* * *

Soon there blazed and thundered over London the wonderful news of Doctor Graham and his Temple of Health. The place in the Terrace being found too small for operations, Schomberg House in Pall Mall was rented, and soon people came flocking. For in the city there was a public hungry for its customary diet of mystery and sensationalism, and Emma Lyon was very ready to help prepare the meal, it being her expressed belief that "them as 'as money and no brains, is meant for them as 'as brains and no money." And money came in

abundance. Two guineas were charged for entrance, ten guineas had to be paid by those who slept in the Celestial bed, and a thousand guineas was the price of a bottle of the famous Elixir of Life, many a wrinkled old dowager paying gladly, hoping to become beautiful as Emma Lyon, better known as Vestina.

*Found Wonderful Things in the Temple*

Those who followed the uncertain guidance of the charlatan and his helper found wonderful things in the Temple—things to astonish and amaze and startle. For there were silken hangings, and perfumed rooms, and hidden voices, and music that seemed to come from nowhere, and gilded stairways with stained-glass windows, and strange-sounding instruments, with Vestina hovering like a golden dream, while Graham himself, it was said, "suddenly appeared clad in oriental robes though every door in any room was locked."

That last, known as the Strange Manifestation, was very widely heralded and very widely believed. Of course, it excited the derision of the well-informed, and one of the honorable exceptions to widespread credulity was Horace Walpole. He wrote to his friend, the Countess of Ossory, August 23, 1780, telling her of his visit to the Temple and giving his sane account of the Strange Manifestation. Thus:

". . . In the evening I went to Dr. Graham's. It is the most impudent puppet-show of imposition I ever saw, and the mountebank himself the dullest of his profession . . . A woman, invisible, warbled to clarionets on the stairs. The decorations are pretty and odd; and the apothecary, who came up a trap door, for no purpose, since he might as well come up the stairs, is a novelty. The electrical experiments are nothing at all singular; and a poor air-pump, that only bursts a bladder, pieces out the farce . . ."

But Walpoles were few, and those willing to pay good gold coin for a new sensation were many. When the Temple of Health waned in popularity, there was a new and preposterous thing to induce a thrill. For Emma Lyon and James Graham had a doctrine to propound and people paid a guinea to hear it. This time it was, to quote the circular: "The whole Art of enjoying Health and Vigor of Mind and Body, and of exalting and preserving Personal Beauty and Loveliness." If certain instructions were followed, it was said whosoever wished might live to be a hundred years or more old. The means to physical perfection was the "Earth Bath," and hundreds paid a heavy price to see Graham and Emma buried up to their armpits in warm mud, Emma's hair "always elaborately dressed in the prevailing fashion, with powder, flowers, feathers, and two ropes of pearls on her neck and bust."

*Many Flocked to See the "Earth Bath"*

One way and another Emma had taken much money, and had made many facile promises to cure the aged of their infirmities, and soon there were those who, notwithstanding mud baths and elixirs, became filled with dark suspicion and grave doubt. For a time, Emma kept them quiet with fair words, or with a little nod and a smile, but soon they threatened activity and then Graham's Temple lost its Vestina, and Emma went to Bath, the fashionable watering place. There, society wondered for a time at her expensive hospitalities, and while at first there was suspicion of the rich-looking and splendid woman whose entertainments were wonders of service, and silver, and lights, and music, and cheerful company, doubt soon fled, and those who were invited were glad and thankful to be seen at her table. And Emma did things with artistic distinction, carrying off matters very well in her little court and managing her followers with spirit and intelligence, though it was abundantly clear that she was no prodigy of learning, nor free from a trace of vulgarity.

*Where Nelson Enters the Story*

There is no very satisfactory explanation of how she came to rule over the household of Sir Harry Featherstonehaugh, but rule she did, and when that arrangement came to an end, there was an alliance with the Honorable Charles Grenville, and it was whispered that Emma Lyon was descended of royal kings. So many doors were open to her and a prince of royal blood was happy when she smiled, and the artist, George Romney, rival of Sir Joshua Reynolds, counted himself lucky to be the painter of her portrait. Somehow that led to an acquaintance with Sir William Hamilton, member of Parliament, archeologist, respected fellow of the Royal society, K.C.B., ambassador to the court at Naples, and before long the nursemaid became Lady Hamilton, a smiling and magnificent society queen. Doubtless there was no very slavish adherence to accepted moral conduct in her composition.

Then came the strange affair not usually commented upon in histories, except in a veiled manner. For about Admiral Horatio Nelson, hero of Copenhagen and the Nile, the romantic Emma wove her web, and soon Nelson became one of a *menage a trois* with the Hamiltons, both men being the best of friends, and Lady Hamilton being more than a friend to both men.

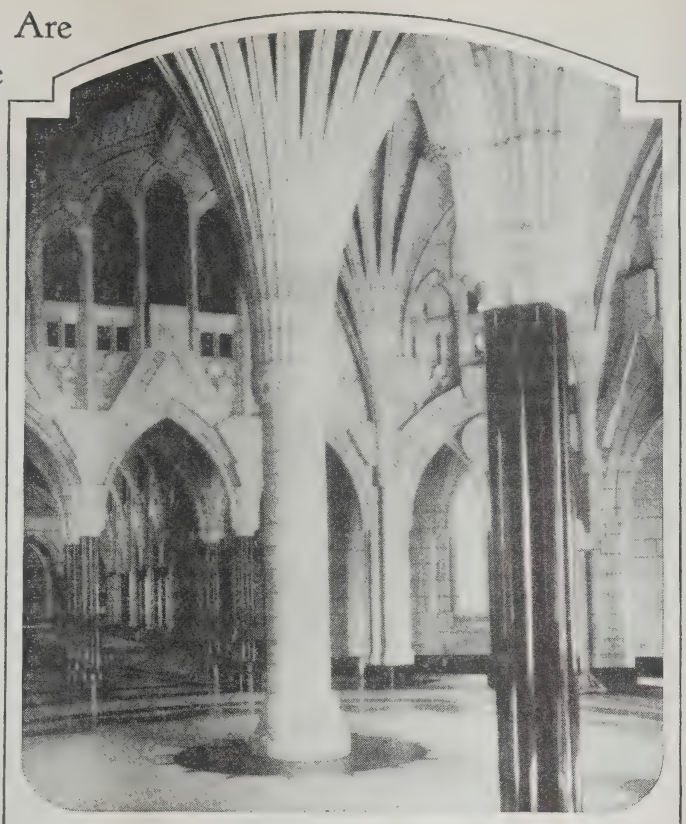
We are told of Lady Hamilton's attitudinizing, falling from her chair in a pretended faint, when a celebrity walked into the drawing-room, spectacularly allowing her hair to fall about her, while Sir William "opened the curtain to give a proper light," and Nelson stood on one side in an attitude of rapt admiration. "That," said Sir William, "is one of the most perfect attitudes that Emma ever executed."

*The Gin-Sodden Creature of Calais*

In spite of a defiance of public opinion, it is clear that Nelson was not without his intrusive anxieties. We get a hint of that in his last words, spoken October 25, 1805, as he lay wounded to death on his ship the *Victory* at the Battle of Trafalgar. "Remember," he said, "I leave Lady Hamilton and my daughter as a legacy to my country." Then, a little later, "Thank God, I have done my duty," which last may be interpreted as having either patriotic or sentimental allusions. For he had kept up his intimacy with Lady Hamilton after the death of Hamilton in 1803.

But the nation had no honors to bestow on Emma, and, being returned to England, she had to endure, as best she could, dark and gloomy days. She knew the inside of the debtor's prison and she knew life in sordid lodging houses. At last she tried to forget the dullness and tiresomeness of her sunset days in drink, and at the end she was a bedraggled, gin-sodden creature in the streets of Calais, avoided by those who had once sought her hospitality, all her hopes and aspirations crumbled into dust.

# Samoans Avoid the *Aitu*



THE Samoan's love for ceremony, especially dignified ceremony, and for singing, has helped much in making him a church member and regular service attendant. But even with his acceptance of Christianity he still, in many cases, keeps a weather eye open for the ancient *aitu* (devil) that had the fear and respect of his ancestors. The *aitu* may be a back number, but you never can tell.

There was the young fellow, for instance, who showed his irreverence a couple of years ago by walking across an old chief's grave. His family and everyone else warned him about the *aitu*, did they not? Still he walked on the grave. A few days later he had a bad cold. Shortly after he was dead. Quick tuberculosis.

How much better it is for a Christian or anyone to respect ancient things and thus not arouse the wrath of the *aitu* on guard! So the Samoan gives the *aitu* a wide berth, hoping his slumbers among the holy places he guards will be undisturbed so long that they will become permanent.

## Ottawa Impressions Are Not Quite as One Might Look for

By E. L. CHICANOT

Main entrance hall, Parliament Building, Ottawa.

# In the Gallery of the Canadian House

TO SAY that I was thrilled when a journalistic friend offered to secure for me a ticket of admission to the gallery of the Canadian House of Commons which was in session is to understate my emotion. It really seemed too astonishing to be true. Though I had frequently been in Ottawa, the possibility of witnessing Canadian legislation actually in the making had never for an instant occurred to me before. Here I was in a part of the British Empire and yet I was shaken at being casually asked if I wanted to attend a sitting of the House. It was too utterly astounding.

With the pleasing sensation of having been especially favored I made my way up the long terrace leading to the hallowed precincts of State in a mood of much profounder reverence than possesses me on the occasion of my hebdomadal visit to church. Consequently I was considerably surprised, and not a little piqued, at the ease of my admission. A conservatively uniformed official, who might have been soldier, policeman, or store commissionaire, took my ticket after the nonchalant manner of an attendant at a picture house. There was no heavily armed guard, not even a solitary beefeater. There was no rigorous scrutiny, no searching for lethal weapons, no inquiry into my habits or ancestry. I might have been the most violent revolutionary. My attendant did not seem to mind. The pleasant idea I had harbored of being one of an especially honored few suffered a rude jolt.

I followed my escort through a series of somber, high, vaulted corridors in that splendid and impressive building which is gradually arising upon the foundation of the old legislature destroyed by fire during the war years. Finally he pushed open a heavy door, stood aside to let me pass in, and I was in the gallery. I walked upon a floor carpeted so thickly as effectually to deaden my footfalls.

Again I was to suffer disillusionment. I had pictured the gallery densely packed with a thrilled and awed crowd, swayed by bursts of oratory, pulsating with every human emotion. I found that I was one of a mere score or so of widely scattered spectators, apparently bored with the proceedings.

I had expected a dignified and impressive scene, the most rigid convention and ceremony prevailing, the awesome silence of the chamber broken only by the member holding the floor, upon whom all eyes would be focussed and to whose words every ear would be attentive. Instead, parliament, dissociated from its gorgeously solemn setting, seemed much more like a glorified meeting of school trustees in a rural district, gathered to deliberate over the question of painting the schoolhouse.

In a half-filled house, seated in twos, some with their hats on and one wearing a none too reputable cap, members lolled in their benches as though serenely unconscious that the eyes of a nation were fixed upon them, their deliberations and decisions eagerly followed and awaited. They laughed and chatted together and strolled in and out of the chamber in the most unconcerned manner. No one seemed the least interested in the member who was on his feet and orating who, however, kept thundering on quite undisturbed as if he expected nothing else.

The one member of the House who seemed to maintain strict decorum, who imparted to the assembly its lone touch of dignity, and seemed to restrain members from indulgence in absolute schoolboy outbursts of frivolity

Interior of House of Commons, Ottawa.

and irresponsibility, was the speaker who, from his throne at the end of the chamber, surveyed the benches before him with the kindly yet disciplinary expression of a schoolmaster. He held the House with a light but firm rein, checking the impetuous, quietly but firmly rebuking those inclined to become too unruly, making his decisions as to procedure in gentle but authoritative tones.

On the steps of the speaker's throne sat a number of page boys in the only Eton suits I ever saw in Canada. Their casual way of distributing themselves about the sacred dais was distinctly reminiscent of those old paintings depicting the courts of medieval kings.

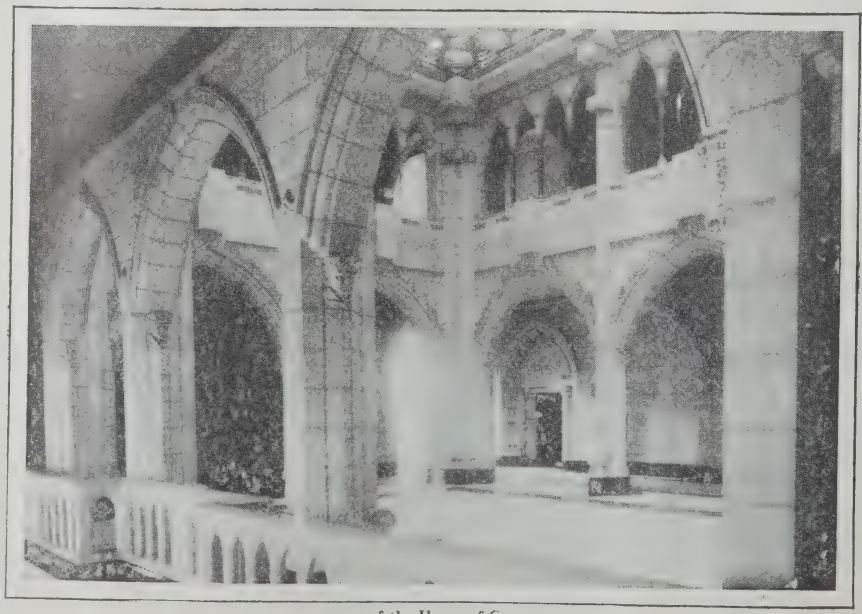
Any remaining vestige of awe or reverence I might still have entertained was completely banished on making a survey of the members of the house. They were not in the least the eminently distinguished, or characteristically outstanding supermen I had fondly pictured the carefully selected legislators of the nation would be. In fact, I thought an unconventional portrait of the gathering might be taken and called "Jack Canuk in Repose," so typical would it be of the general Canadian public. All the Dominion types which are evolving were to be found there. There was the western farmer who seemed to have just doffed his overalls to put on his best suit which had been lying in the closet unpressed since his visit to the livestock show at Calgary or Regina. There was the alert, confident, sprucely attired Canadian business man who seemed just to have stepped out of his store or office and carried his tradition religiously with him.

There was the professional man, the doctor or lawyer, more intellectual in cast of countenance, and clothes not generally quite so spruce.

They were all average Canadians, the kind one meets in masses on the streets of Montreal or Toronto, sees at work on the farms of Alberta or Saskatchewan, encounters in the fishing towns of the Maritimes or the lumber camps of British Columbia. In only two cases that I could ascertain was my diagnosis hopelessly wrong. A most reactionary and socialistic labor member I had mentally set down as a Presbyterian minister, while the member of the nondescript cap who had all the appearance of being a violent revolutionary turned out to be a prominent and most respectable captain of industry.

Even the premier and leader of the government lost a good deal of his romance seen in this his most natural environment, and I wondered how he could sit so calmly, reflecting with head resting upon his hand, gazing most peacefully and benignly across at the leader of the opposition who on the previous day had cut his parliamentary reputation to pieces in that frank and ruthless way we have in Canada.

Main front of Canadian House of Parliament.



The proceedings of Canada's parliament are not characterized by that reserve of manner, that restraint of conduct, that dignity of procedure which one is wont to associate with British parliamentary affairs and, dieted on this from youth, to look for. Approximately about ten per cent of the members present appeared to have any interest at all in what the member holding the floor was talking about. Every few minutes one of these apparently attentive ones would tire and slouch out of the chamber with an expression of boredom which should have infuriated the orator, though he gave absolutely no indication of it.

The others were engaged in sparkling tête à têtes, writing letters, draw ing figures on their pads, or drinking copious supplies of water. They crossed to the other side of the house whenever they felt so inclined, though always pulling up in the center to bow respectfully to the speaker, and in every possible manner seemed to be endeavoring to impress upon the member holding the floor their total disregard for, and entire lack of interest in, what he was orating about. Occasionally, strictly against the etiquette of the House, and much after the impetuous manner of a daring schoolboy, a member would interject a remark humorous or caustic, to be reproved promptly by the speaker.

And yet a good deal seemed to be accomplished even as I sat there. The manner in which laws were made was terrifyingly simple once the process got under way. The member who had been holding forth worked up to a climax of oratory, which seemed only to deepen the air of boredom, and with a final glance at the Hansard reporters, who were his real audience and who would, through the official publication, spread his utterance through the dominion, sat down.

The speaker slowly read a resolution in his cultured French accent, asked for a vote, received a purely indistinguishable murmur from the House, and said "Passed." Another law had been added to the statutes, and Canadian life was hemmed about with another piece of legislation.

It is, therefore, not surprising to observe the voluminous amount of new legislation each session.

A corner of the House of Commons.

***A Former Cabinet Member*** dropped into The Office: "I have been trying to find out what the people are thinking," said he.

"And what are they thinking?" asked we.

"They are not thinking," said he. "I do not remember a time when the people were thinking less than now."

"And what do you think is the cause of it?" asked we.

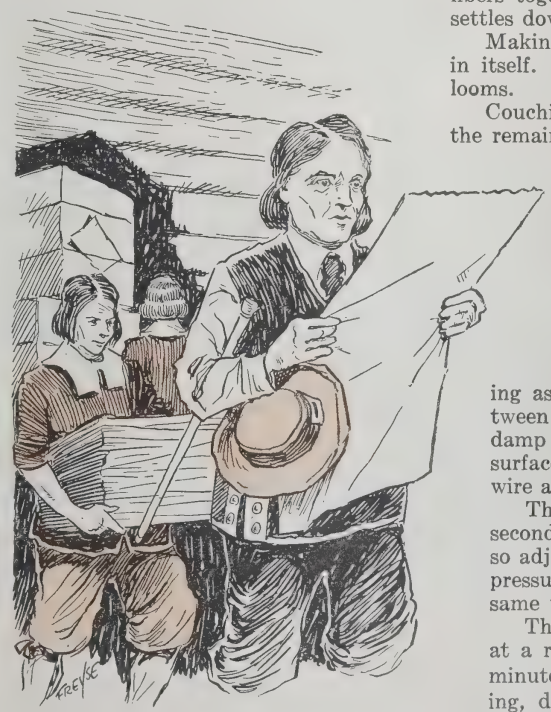
"That is where I have to confess my unity with the people," said he, "—I don't know. If I knew, perhaps I could help. Nobody knows, so nobody is helping. Sometimes I think it is the natural reaction of the strenuous years of Roosevelt and Wilson. When these men led, the people had to do more or less thinking. They compelled the holding of opinions for or against, and an intelligent opinion requires some thought in its make-up. Maybe the people are resting up from that long experience."

"But," said we, "they have had Harding and Coolidge since then; surely these have been restful enough."

"Yes," said he, "but it takes a nation a long time to rest up. I don't like to think that we are getting soft. I don't like to think that our material prosperity has bribed us out of mental and spiritual activity. But—well, I'm puzzled."

"Isn't it possible," asked we, "that your political career predisposes you to gauge the people's mental activity by the amount of thought they expend on political affairs? When they are not agitated about politics, you assume that they are not thinking at all; isn't that your formula?"

"Well, there may be something in that," said he. "But if it is so—if they are merely not thinking about politics, what are they thinking of?"



"There," said we, "we can make no pretense to omniscience. But, mark you, the people are thinking to this extent—they are thinking that all the thinking they have done before did not amount to much simply because it was political. They are thinking that life is only incidentally political, that we have been making the big tent out of what is just naturally a side show. That's what they're thinking. We are passing out of adolescence into earlier maturity as a people—and you know how people appear listless when really they are brooding through the most vital changes of their life. That is what is happening to the people. They are thinking, their minds are turning over, but it will not be the old things that come out when the process is finished; it will be something new. Better get ready for it."

"True," said the former Cabinet member, "instead of studying the people we had better watch ourselves, for what our own minds are doing will furnish a clue to what the people's mind is doing."

***The Man from Montana*** dropped into The Office and complained at the treatment he had received at the hands of an employment agency in the city. He said that, together with thousands of others in his circumstances, he had left the ranches and farms and come to the city to work until spring. The employment agency first took his $8.00 and told him to report for duty at a certain factory next morning. He was there on time but the plant was not hiring that morning. He returned to the agency and they told him to report again next morning at the same place. He turned up at the factory doors promptly the next morning. The man in charge of employment said there was nothing doing. The workman returned to the agency and demanded the return of his money. They gave it up reluctantly. Evidently the agency had no arrangement with the factory, but simply sent the man out there on the chance that he would find a job. This is a peculiarly vicious form of swindling. In Seattle the applicant for work receives his pay, from the agency, from the time his card is stamped in the employment office until he returns saying he has failed to find work at the plant recommended. The same is true in Montana cities.

# From Tree to Printing Press

THE basis for paper may be of two kinds—rags and wood fiber. Rags are generally used for finer grades of paper, and wood for the cheaper. This material is thrown into a huge vat, with a wheel inside which tears the material apart, and reduces it to a soft, pulpy mass. There is an arrangement for pouring the pulp over a wire gauze mold, which is an endless sheet moving around two rollers. Under the part which receives the pulp there is a series of small brass rollers, which keep it perfectly level, and arrangement of suction boxes and tubes, worked by air pumps, which draw much of the water out as the pulp passes over them.

The framework on which the surface of the wire gauze rests shakes with a sidewise motion, which works the fibers together before the pulp finally settles down.

Making this gauze is an industry in itself. It is woven by hand-swung looms.

Couching rolls press out most of the remaining moisture, and carry the pulp to the first and second series of press rolls. The paper next meets with a felt sheet, which keeps it in close contact with large drying cylinders, filled with steam.

Around these the embryo paper passes, drying as it goes. It is received between two smoothing rolls, or damp cylinders, which press both surfaces, removing marks of the wire and felt.

The drying is finished on a second series of drying cylinders, so adjusted as to give considerable pressure to the paper, and at the same time a glossiness.

The paper machine produces at a rate of from 30 to 75 feet a minute, spreading the pulp, couching, drying and calendering it as it goes, so that the stream of pulp flowing in at one end of the machine is in two minutes passed out, finished paper, at the other.

It has been estimated that an ordinary paper machine, making webs of paper 54 inches wide, will turn out four miles of paper a day.—*F.D.H.*

# He Licked Fall in His Own Paper

(*Continued from page 3*)

people confidence in me. I wasn't firing a bird-shot charge that would scatter anywhere; I was firing a rifle with one ball and I was firing it at somebody in particular, and it always hit."

Then came the big climax in the Teapot Dome scandal.

"This fellow Fall had already talked to me in a childlike way about everything. He told me about the political ring and how they managed it. Then he proceeded to tell me that he was broke; that he was glad to sell the paper and get his share That was when I bought the paper. Again in 1920 he told me that he was broke. He told me that he had unpaid taxes on his ranch which were in arrears some years. He even went so far as to tell me that he must get out of the Senate; that it was too expensive for him.

"Then late in 1922 it was known that Sinclair had come to Three Rivers in his special car.

"Early in 1923, Fall paid off his arrears in taxes, got two high-priced automobiles, and put about $90,000 into improvements on his ranch. You know you can't put in a big electric water plant without the neighbors knowing about it and talking about it.

"These rumors started me to work. I had the idea that something had been pulled off at Three Rivers as a result of the visit of that private car.

"Something was also being pulled off in Washington as well as at Three Rivers. My suspicions deepened when suddenly Fall went into the Cabinet.

"Everybody knows now, it is a matter of record, that Fall took up the matter of the lease of the Teapot Dome Naval reserves as soon as he got into office and I kept hammering at this thing long before it broke in Washington. I had heard rumors about a satchel with money in it. I kept talking about that satchel. I kept hinting at Teapot Dome and asking who was going to get the lease long before the investigations began in Washington. We knew about it down there."

"Did you go to Washington?"

"I did."

"What did you tell them?"

"I informed them that in 1920 Fall told me he was broke, but that since he had gone into the Cabinet he had spent over $200,000 on his ranch. Then I said to the Senators: 'I wonder where he got the money?'

"Before they called me, Senator Walsh was asking whether it was advisable to lease the Teapot Dome to a private corporation. I wired him and said, 'That's not the question to ask! Ask if it is honest; find out if it is a crooked deal.' That started the investigation on a different phase."

"Where did Fall get the money?" That was the question that started it all. That question was asked by editor Carl Magee, of whom the American people ought to know. The nation knows the rest of the story but it does not know that an obscure, determined, Christian newspaper editor started the ball rolling.

But the last chapter of this man's fight has been the most intense.

"One morning in June, 1923, a Spanish-speaking husky walked into my newspaper office in Albuquerque and said, 'I'm a deputy sheriff and I have been sent to take you to Las Vegas. I have a warrant for your arrest for criminal libel!'

"I looked at the warrant and saw that I was accused of libel because I had written of a certain judge who lived in San Miguel, 120 miles away. I wrote that he had grown too accustomed to old methods to see anything wrong in what had happened.

State capitol at Santa Fe, New Mexico.

"I was referring to the Fall case. I knew that this time they meant to do the worst they could do to me.

"I could have used influence and got out of going to Las Vegas. I asked my wife what to do, and she said something that heartened my soul.

" 'It would be easier to see you go to jail than to see you run.' "

Magee was warned that he was not to write anything about the trial.

But every day Magee wrote an article calling the proceedings unjust and illegal.

The Spanish-speaking jury, following the judge's orders, brought in a verdict of "guilty" within a few minutes and the judge imposed a sentence of eighteen months in the penitentiary and a fine. Immediately following this sentence Magee was put on trial before the same judge for contempt of court.

"I was put on the witness stand. The lawyer asked me if I still said that the judge who was trying me was corrupt and I said, 'He is!'

"When the second trial was over he sentenced me to another year in jail and a fine of $4,050."

"What happened then?" I asked.

"The governor immediately pardoned me and made a statement that the proceedings at Las Vegas were a blot on the state and a disgrace to all good people.

"I have nothing against Judge Dan Leahy in private life. But I criticized his public acts and I started a movement to defeat him at the elections and we licked him good.

"During the trial they put me in jail. My friends, the cowboys, were afraid for me. One little stunt the politicans had was to throw a man in jail overnight among a lot of Mexicans. Then they arranged it so that a fight would come about and the victim would have his eyes gouged out, and the politicians would tell the newspapers that nobody was to blame; it was just a fight in the jail."

Five hundred cowboys accompanied Magee to jail and told the sheriff that if anything happened to Magee, if he even received a scratch, they would tear the jail to pieces and the sheriff would answer to them. They brought

him his meals to avoid any mischance. They posted guards around the jail all night to be sure that nothing happened to him and every hour Magee would call out,

"I'm all right boys!"

His prison doors were left open. He thinks that probably this was to tempt him to try to escape; that would give his enemies a chance to shoot him as a fugitive.

***When Magee Went to Las Vegas***

Magee was pardoned by the governor. Then the governor wanted Magee to serve on the board of directors of the insane asylum.

"If he goes on that board I'll stamp his life out!" Leahy was reported to have said.

"That put me in a place where I had to go on," said Magee. "It meant that I had to visit Las Vegas every time there was a meeting. Judge Leahy lived there. The governor knew there was danger, but he said, 'I've got to have a man with courage to straighten out the affairs of that asylum. You're the man.'

" 'If I go to Las Vegas with Judge Leahy's threat hanging over me, I'll have to have permission to carry a gun for self-protection,' I told the governor.

"I had never carried a gun before, during all my trouble. I went to four board meetings and nothing happened. But one night when I started out my daughter Gertrude wanted to go with me. I was climbing into the automobile when Gertrude said, 'Daddy, do you have your gun with you?'

"I told her that I did not have it; that Leahy had had time to get over his hard feelings and that I didn't think I would carry the gun any more. She insisted upon going back into the house for it. I called for her to get the little gun, for there were two in my dresser. The big one, I said, was too heavy to carry. We were stopping at the Meadow Hotel. I felt so safe in that hotel that when I came in I would always throw my gun on the table before going downstairs to eat. But on this particular day I kept it in my pocket.

***The Fight in the Lobby of the Hotel***

"I had eaten my supper and was being interviewed by a girl reporter of a local paper. We were sitting on a big sofa in the middle of the lobby. Suddenly Leahy walked in. The reporter said to me, 'There's your friend!' There were several women in the lobby and I never dreamed that he would attack me. But suddenly he started walking toward me.

"Even then I didn't think he would attack me. However, I kept my eyes open. I had that little gun in my left pocket. I didn't even shift it. Suddenly he turned and hit me on the side of my head and knocked me to the floor. The gun fell to the floor. Then Leahy started to kick me. He kicked me in the face and all over my body. I instinctively lifted up my leg to protect my body but he pulled my leg down so that he could kick at my stomach. I was semi-conscious only, but was awake enough to see that gun lying on the floor. I reached for it and shot Leahy through the arm, but one of the stray bullets hit a young man who had been trying to save me from Leahy's assault. He had twice jumped on Leahy, who is a big six-footer, and had been shaken off. The lad received a shot.

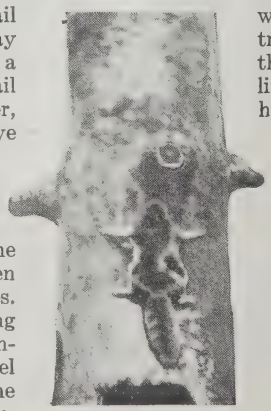
"It went in through his neck and straight through the spinal column. It killed him instantly.

"Gertrude was upstairs in her room when she heard the shot, and ran down. She saw me lying on the lobby floor and saw the dead boy. She is only sixteen but that child acted like a grown woman. She took charge of everything; whispered into my half-conscious brain, 'Don't talk, Daddy! Don't say a word!'

"I am out on bail for murdering a man who was trying to save my life. Up to that night the fight was a merry one and I rather liked it. But from that hour it has been terrible. If I get one man on the jury who can speak and understand English I will be doing well. The district judge will be Spanish, the prosecutor will be Spanish and the sheriff will be Spanish."

"What happened to Leahy?" I asked him.

***The Story Sheds Light on Teapot Dome***



"Nothing! Nothing will ever happen to him by the act of man, unless the state attorney-general goes in and forces an indictment before the grand jury."

It seems to me that this is the most remarkable fight for decency and honor in politics; for freedom of the press; and righteousness in public thinking that I have ever listened to. I think the nation should know the story. It is the explanation of much that is obscure in the Teapot Dome scandal.

# Pohkahn, the Little Glider

By D. LANGE

POHKAHN is the Yankton Sioux for flying squirrel. Pohkahn is not really a flyer, but he is a bold and skillful glider. A soft fur-covered fold of skin connects his foreleg and hind leg on each side, and the long fine hair on his tail is attached in such a way that its lower side makes a flat surface. Thus the tail serves not only as a rudder, but it increases his effective gliding surface and enables him to make those quick upward turns in mid-air which are both a surprise and a delight to the observer, even if he has seen the performance many times.

Every time I see a flying squirrel jump boldly downward out of a tree top, I feel that he is going to hit the ground hard with his nose, but he never does. Always in the nick of time, he makes an upward curve and lands safely on his feet against the trunk of another tree, nose up and tail down. If he is in the traveling mood, he runs up the second tree about as fast as his cousin Adjidahno, the red imp of the forest, and down he jumps out of the top branches for another bold glide.

Although flying squirrels are at least as common as red squirrels, they are seldom seen. They are even common in most suburbs, where there are enough trees left; and sometimes they make their nest in the attic or the wall of a house.

They are strictly nocturnal and never show themselves in the daytime unless they are disturbed.

Their natural homes are hollow trees, and they are small enough to slip easily into a woodpecker hole. Old hollow trees should be spared, so that many birds and the little woodfolk may not be homeless.

Once I tapped Pohkahn out of a dead poplar, and for a moment I thought I had discovered the winter quarters of a whole family of flying squirrels, but I soon discovered that the little creature was fooling me. He slipped out of the hole on my side of the tree and promptly returned by a hole on the other side.

I returned a week later with my camera. To my delight, I found Pohkahn at home and managed to take his picture, showing him cleaving to the tree, where his buff fur blended perfectly with the deadwood.

Flying squirrels do not hibernate, but almost nothing is definitely known about their feeding habits. No doubt, like other squirrels, they eat nuts and acorns; and, in the absence of those, they get along on pine and spruce seeds and buds, for they are found far north of the limit of oaks and nut trees.

Their range extends from Nova Scotia to Florida and from the Atlantic Coast to California and Alaska.

# Is There a Yellow Race?

(Concluded from page 6)

gol, a white man."

In connection with this revival of art in China, Dr. Legendre goes on to say that Kublai Khan gathered artists, musicians, poets, writers and scientists from all parts of Asia, and even from Eastern Europe, making it worth their while to live in China and there produce the best of which they were capable. This period in Chinese art must have been comparable with that of Lorenzo the Magnificent in Italy. Continuing along these lines, however, the "re-discoverer of China," as Dr. Legendre has been called, says:

"One should not get the idea that the art of China is derived exclusively from Greece and Persia. Archeology seems to show that the art of the first dynasties was a reproduction of the art of Babylon. Griffons and dragons—the latter considered exclusively Chinese symbolism—are characteristic of Babylonian and Assyrian art. In short, China is a depository of Mesopotamian, Greek and Persian arts, each and all of which have been drawn upon to make up the composite of Chinese art, just as the black and white races have been drawn upon to make up the mulatto mixture which is now the population of China."

The Chinese on the right might be mistaken for a light-colored Negro. Interior China contains many natives who are more pronouncedly negroid than this man.

The search for original Chinese genius is hopeless, in the opinion of the French Sinologue, who believes that the mother idea for everything Chinese is to be found in some other and more ancient country, notably in that part of Central Asia inhabited since very ancient times by the Iranians (whites). "Even the much-discussed Chinese philosophy is no exception," says Dr. Legendre. "Not to mention Confucius, who was merely a moralist, the doctrine of Lao Tse, which is that of renouncement and abstemiousness, is only the repetition of a creed then prominent in India—the Oupanishad. One looks in vain throughout China to find anything approaching the great achievements of the white people of the world. In fact, the Aryan and the Semite are responsible for every civilization that ever existed on this planet, and for all the progress of humanity. They founded all the great empires, including the Chinese Empire. There never has been a 'yellow' civilization, just as there never has been a 'black' one. There never has been any kind of a civilization except that of the white races."

The process of absorption of the white invaders first by the negroids and then by the mulattoes through centuries which cannot be computed, is explained by Dr. Legendre as a "widely practiced polygamy." The same process is known to have operated in India, where the whites were absorbed through mingling polygamously with the "Anasas," or noseless tribes, which were, of course, negroid. To this day, however, the higher castes in India show plainly their Aryan ancestry, as—according to this investigator—do the ruling people of China. "For untold centuries, the Huns played major parts in China, India, the Iranian Plateau and Southern Russia," continues Dr. Legendre. "Their all-conquering armies roamed from the Yellow Sea on the eastern shores of Asia to the Black Sea in Europe; Asia yielded in terror to them, and Europe trembled at their approach. The Chinese called them 'Hion-Nu'; the Greeks named them 'Indo-Scythes'; and later historians of Europe have classified them as 'Turko-Mongols.' But the Huns of Attila and the Mongols of Genghis Khan have been considered always as belonging to the 'yellow race,' and the modern Hungarians and Bulgarians have been classified as descendants of Mongolians, similarly 'yellow men.' "

According to Dr. Legendre, these conclusions are all wrong. He claims to have records to prove that the greater part of the fighting forces of Attila and Genghis Khan were Iranians, Turks and Ousouns. Thus, the true Huns were peoples of Caucasian blood, white, many of them blue-eyed and fair-haired. Among them, and considerable in numbers, were men and women of small stature, prognathous jaw, flattened nose, and thick lips. These were Negroes, negroids and mulattoes, the servants of the white Huns, mixed with vanquished tribes which were carried in the train of the victorious Hordes. These black and gray and yellow underlings, who, because of their very numbers, gave the character of yellow to the moving armies, were of low biological development and utterly incapable of conceiving or carrying out the tremendous conquests, or the organizations of all the tribes of Asia, accomplished by the white Hun chieftains and their equally white armies.

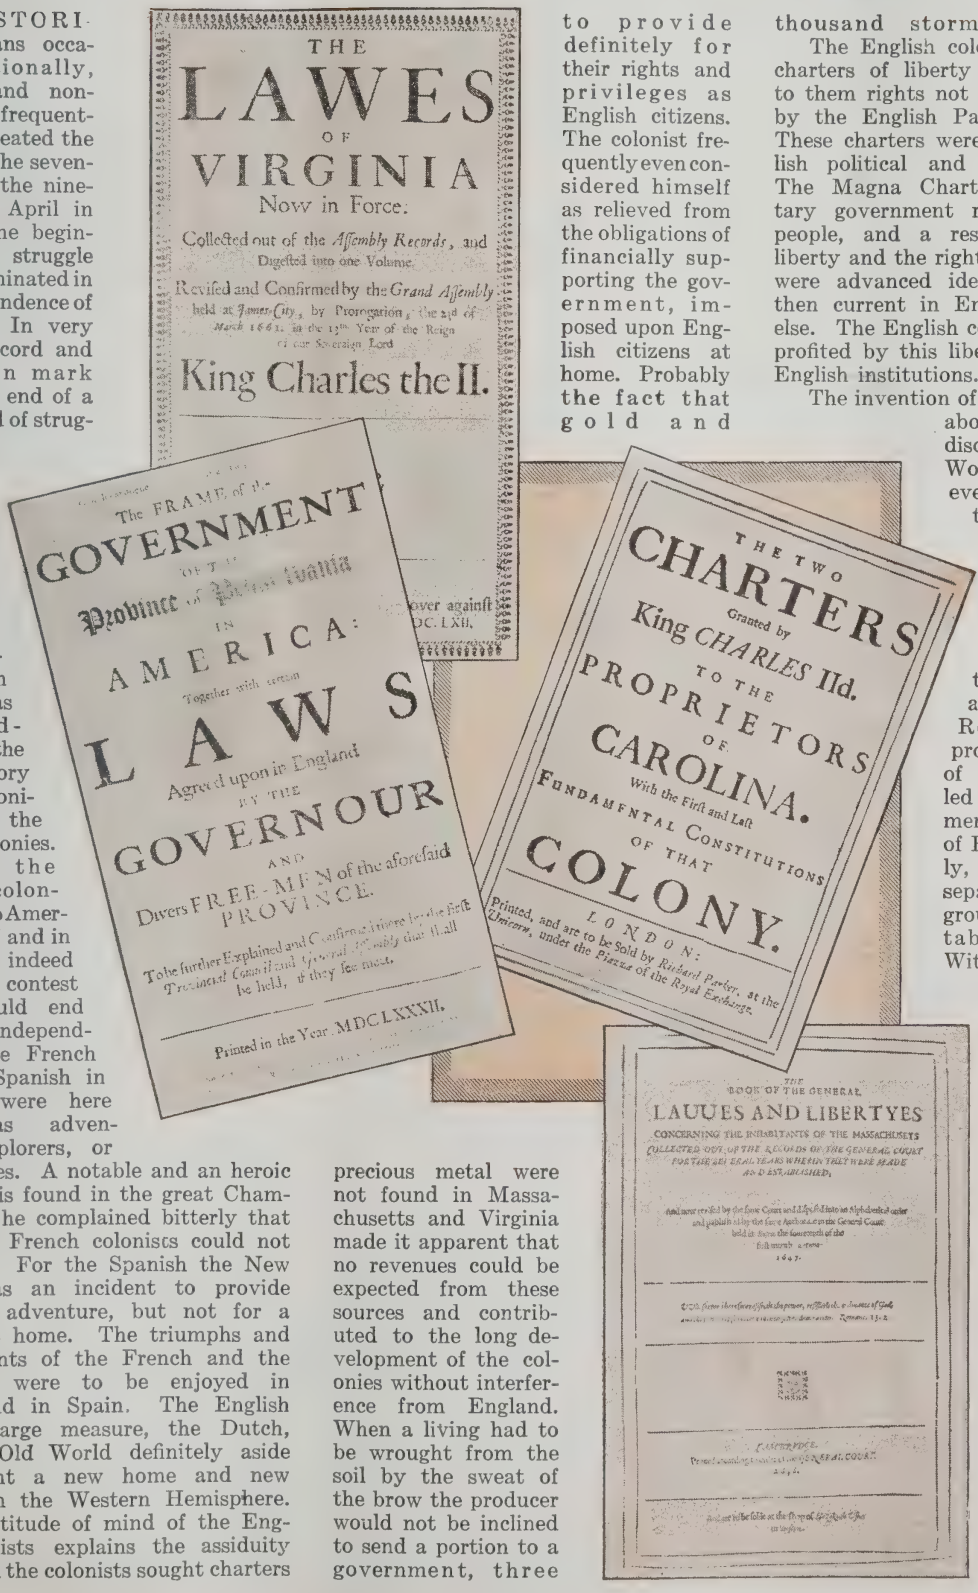
In other words, the Attilas, the Tamerlanes, the Genghis Khans—large and small, all the leaders who sought to unite Asia against Europe—were not yellow men, but Turko-Iranians belonging to the white royal tribes of Mongolia. And the Mongols, in the beginning, were not a race, but merely one tribe in a race, all white, and so named from one of their greatest chiefs, Mong Gou, an ancestor of Genghis Khan. Heirs to a wonderful Iranian civilization initiated into the arts and philosophies of Europe by the Nestorians at a later date, they attempted to carry this civilization to dominance over the then known world—but were absorbed by the lesser tribes they conquered, to form the so-called "yellow race" of Asia.

In 1237 a vast Mongol horde entered Russia and, after carrying destruction through that country with fire and sword and forcing the princes to do homage, pressed into Poland and Germany and on the field known as the Wahlstatt, near Liegnitz, in Silesia, defeated an army of Poles, Silesians, and Teutonic Knights, in April, 1241, suffering such heavy losses, however, as to be compelled to retreat. In the same year another army under Batu Khan overwhelmed the Hungarians.

# The Men of the Mayflower as Fathers of the Republic

By LOUIS C. KARPINSKI

HISTORIans occasionally, and non-historians frequently, have treated the events of the seventeenth to the nineteenth of April in 1775 as the beginning of a struggle which culminated in the Independence of America. In very truth Concord and Lexington mark rather the end of a long period of struggle between the Old World and the New, and the inevitable complete separation which was foreshadowed in the early history of the colonization of the English colonies.



When the English colonists came to America in 1607 and in 1620 then indeed began a contest which could end only in independence. The French and the Spanish in America were here largely as adventurers, explorers, or missionaries. A notable and an heroic exception is found in the great Champlain and he complained bitterly that more true French colonists could not be found. For the Spanish the New World was an incident to provide gold and adventure, but not for a permanent home. The triumphs and achievements of the French and the Spaniards were to be enjoyed in France and in Spain. The English and, in large measure, the Dutch, cast the Old World definitely aside and sought a new home and new liberties in the Western Hemisphere.
